to make money, but in every one of its announcements the particular thought that is most prominently brought out is service to the consumer. Particularly noticeable in every announcement is the subtle reference to the sentiments which are the mainspring of action and control the expenditure of money more often than reason or logic.

Written from the Buyer's Point of View

To fairly apply test No. 6—"Is it consistent?"—to each one of these advertisements, it would be necessary to visit the stores and see how the salespeople back up the advertisement, to note how deliveries are made, to test out the spirit of the store in the matter of adjusting complaints, to check up carefully how the merchandise itself makes good on what has been claimed for it.

What Constitutes Consistent Advertising

In every one of these announcements consistency is shown in illustrations, typography, and diction, and there can be little doubt that in institutions so well managed, where every detail is so thoroughly thought out in advance for the best interest of the consumer, the space given to each department bears its consistent relation to the business as a whole.

In applying test No. 7—"Is it persistent?"—we are confronted with the difficulty that no one advertisement can justify this test.

Persistency

However, persistency is suggested in each one of these announcements in the trademark signature or heading which is individual and characteristic of the house.

Persistency unconsciously is impressed on the reader's mind every time he sees an announcement of a house following any that he has read before.

My readers will agree with me, I am sure, that test No. 8—"Is it authoritative?"—and test No. 9—"Is it plausible?"—are fulfilled without question in each one of these announcements.

The same is true of test No. 10—"Is it sincere?" All of these houses have a reputation all over the United States for being sound in their merchandising methods and scrupulously careful in making claims that are absolutely backed up by the merchandise.

Sincerity in Advertising Is Illustrated by Altman

One of the paradoxes in advertising is the fact that the store of B. Altman & Company, at Thirty-fourth Street and Fifth Avenue, New York, bears no sign whatever. Yet everybody knows it is Altman's store.

B. Altman, who is no longer living in the flesh, dominates the policy of this house in the fundamental principles of sound merchandising which he established during a busy and thoroughly useful life.

The advertising of the house of B. Altman & Company will deserve careful study from those who believe as I do, that advertising in its true mission is an expression of the salesmanship which best serves the buyer.

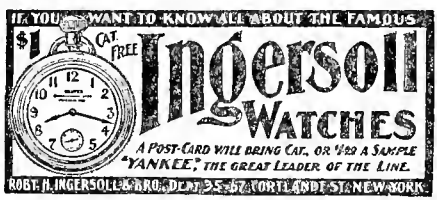
Altman's advertising has been criticised as too dignified and lacking in many of the essentials which are supposed to be characteristic of the most successful advertising copy. Yet for the particular

Altman group it can well be questioned whether there is any other form of announcement better suited to the purchaser.

The Ten Tests Applied to Magazine Advertising

From magazine advertisements I have selected a number for reproduction and comment in the application of the tests, but regret very much that it is utterly impossible to cover the field in anything like the thorough manner that I would wish to do.

I have refrained from reproducing or commenting on any advertisements with which I have had anything to do in the production or handling.



The first Ingersoll watch advertisement, 1893 (Actual size)

How a New Watch Demand Was Created by Ingersoll

Mr. William H. Ingersoll, of Robert Ingersoll & Brothers, has favored me with a copy of the first advertisement which his house put out in 1893; also with a full page in the *Saturday Evening Post* on November 2, 1912, which in his judgment represents the best advertisement that they ever published.

The history of the Ingersoll Watch is particularly interesting because a new field was opened up and thoroughly occupied.

No one who is in position to speak authoritatively claims that the sale of the Ingersoll watches in any way has interfered with those of a higher price.

Many own and use an Ingersoll watch for hunting, fishing, and other purposes where they do not care to risk the loss or misuse of a piece of higher priced mechanism.

In the first advertisement of the Ingersoll watches there was much to be desired. Applying the ten tests to the full page all of them will be found to be justified.

Each one of these ten tests can be applied with satisfaction to the magazine advertisements of the following concerns:

The Secret of Success In Eastman Kodak Advertising

In the Eastman Kodak Company announcement, the broad, universal, constant appeal of the kodak is beautifully expressed, but coupled with it is an immediate sales-impelling suggestion that must produce definite, positive business. Almost everybody is constantly confronted with the necessity of deciding what to give in the way of a wedding present, and this assistance on the part of the Eastman Kodak Company in helping one make up his mind is service indeed.

Keeping the Demand Active for Old Dutch Cleanser

In the Old Dutch Cleanser announcement the sales talk of specialty men calling on the retail trade, house-to-house canvassers, and store demonstrators is all revived by the prominent reproduction of package. At the same time the reference to definite, specific information on the package means the in-

creased use of Old Dutch Cleanser in homes where at the present time it may be bought and used for only one purpose.

The American Telephone and Telegraph Company advertisement is specially good for its obvious purpose.

Advertising to Enhance Confidence

It stands to reason that competition in telephone systems is not service to the ultimate buyer if rates are reasonable and the scope of service is continually increased. As long as the American Telephone and Telegraph Company indicates in its announcements that it desires to give service to the public, the people generally are more likely to feel that it is sincere in that purpose than if it said nothing about it or maintained a dignified silence on the subject.

The general effect of the Swift magazine advertisement is particularly good, though as a rule I am

Focusing Demand on Swift's Premium Ham

afraid of white letters on black background when used other than in a brief heading where the letters are large. Legibility is always sacrificed to some degree at least.

The information in this advertisement is valuable to the housewives, and the specific point is bound to influence the buyer to more particularly specify Swift's Premium Ham than to simply say she wants some good ham.

The Subtle Handling of Hydraulic Press Brick Advertising

The Hydraulic Press Brick advertisement deals with a ticklish subject in a very frank, straightforward manner. The expression of confidence on the part of the Hydraulic Press Brick

The Watch that made the Dollar Famous

Thin Model Gentlemen's *"Eclipse"* $1.50

4 Models *Ingersoll* Watches

Thirty million Americans have bought and timed their lives by the Ingersoll watch. More than half of all the watches now made in this country are Ingersolls,—14,000 every day.

By sheer force of utility the Ingersoll has overcome the incredulity that naturally attaches to low price and has been adopted into every nook and corner of American life.

Side by side with such men as Thomas Edison and Glenn Curtiss, the street urchin, the business man, the clerk, the school-child and the laborer mark time with the Ingersoll. All find it sufficient for practical needs.

People now pride themselves on buying satisfactory watch service at the lowest cost. To wear an Ingersoll has become a badge of thrift and enlightened recognition of today's mechanical attainments.

There is an Ingersoll for every one. The four models shown on this page take care of the needs of men and boys who want small, thin watches. The "Midget" at $2.00 is being adopted by our nation of women and is the most satisfactory of all watches for girls and little boys.

Ingersoll watches are sold in every town and hamlet by over 60,000 dealers. Booklet free.

Robt. H. Ingersoll & Bro., 21 Ashland Bldg., New York

Small Thin Model *"Junior"* $2.00

The "Midget"—the watch for a woman's handbag and a child's pocket

OF all the gifts that fit the wedding day,—none so timely as the one that provides the means for telling the picture story of that day,—

The Energizer of Business

IN a metropolitan power-house there must be generators large enough to furnish millions of lights and provide electrical current for thousands of cars and factories

Each monster machine with the power of tens of thousands of horses is energized by an unobtrusive little dynamo, which is technically known as an "exciter."

This exciter by its electric impulse through all the coils of the generator brings the whole mechanism into life and activity.

A similar service is performed for the great agencies of business and industry by the telephones of the Bell System. They carry the currents of communication everywhere to energize our intricate social and business mechanism.

United for universal service, Bell Telephones give maximum efficiency to the big generators of production and commerce.

10% More for Your Money

Quaker Oats is now put up also in a 25-cent size, nearly three times as large as the 10-cent size. By saving in packing it offers you 10 per cent more for your money. See how long it lasts.

That Quaker Oats Aroma

The very aroma of Quaker Oats tells its exquisite flavor. You know before you taste it that there's choiceness in this dish.

Only the big grains yield that aroma. And, without the Quaker process, it could never be kept intact.

That's why Quaker Oats is distinctive.

We get that flavor and we preserve it. We discard all the grains which lack it, so the flavor is never diluted.

If you enjoy it, you can always get it by simply saying "Quaker." And without any extra price.

Quaker Oats

Rolled from the Largest Grains

We get but ten pounds of Quaker Oats from a bushel, because of this selection. But those are the luscious flakes. The others are good enough for horses, but not for boys and girls.

We started to do that 25 years ago, and the famed thistle flavor spread. Now a hundred nations send here to get Quaker Oats. And millions of children in every clime enjoy it every morning.

Quaker Oats, as an energy food, excels anything else you know. It abounds in the elements needed for brains and nerves. It is known as "the food of foods."

But, without that taste which makes it inviting, few children would eat half enough.

That's why we supply that flavor, and why you ought to get it. And to get it is always easy. Quaker is sold in half a million stores.

Serve Quaker Oats in large dishes. Small servings are not sufficient to show its vim-producing power.

10c and 25c per Package

Except in far West and South

The large 25-cent package gives ten per cent more for the money

"No More Darning for You, Mother—

This Holeproof Six Months' Guarantee Settles That"

MADAM, why does your family wear stockings and socks that need darning every week? Here is hosiery that doesn't need darning—socks and stockings for *men, women, children and infants.*

Six pairs of Holeproof will wear *half a year* without holes or tears. That is guaranteed. If any of the six pairs *fail* in that time we will replace them with *new* hose free. Tell your family about them. They don't *want* you to darn for them. And none of them likes the *discomfort* of darned hose.

For 14 Years

For 14 years *hundreds of thousands* of people have worn no other hosiery than Holeproof.

More than 1,000,000 people ask for Holeproof *today* in thousands of stores in the United States.

Europe is sending for thousands of boxes. And we are operating a factory *in Canada.*

Pure Worth

We go to extremes to get the finest materials. We use the world's *highest-priced* cotton yarns. We could buy yarns in this country for less than *half* what we pay.

But we use yarn of an *extra-long fibre* which means pliability, light weight, softness and strength.

No other yarn permits better *style.* And we produce Holeproofs in all the smartest shades.

Sold Everywhere

The genuine Holeproofs are sold in your town. We'll send the dealer's name on request, or ship direct when there is no dealer near. Charges prepaid on receipt of remittance. We make Holeproofs for men and women in cotton or silk.

We have the finest weights for winter. You will never have one more darning to do once your people learn the reason for Holeproof's universal popularity. Write for the free book that tells all about Holeproof. Let all *the family* see how they are made.

$2.00 per box for three pairs of men's silk Holeproof socks. $3.00 per box for three pairs of women's silk Holeproof stockings. Boxes of silk guaranteed three months.

Holeproof Silk Gloves FOR WOMEN

For long wear, fit and style, these are the finest silk gloves produced. Made in all lengths, sizes and colors.

Write for the illustrated book that tells all about them and write for the name of the dealer near you who sells them.

(525)

IT is the little personal touches about a home that count. The artistic hanging of a drapery, the harmonious grouping of furniture, the sunny freshness of a newly washed curtain, the glowing cleanness of ornaments and bric-a-brac—such things as these help make home homelike and show not merely industry on the part of the housekeeper but a knack of properly caring for fine things.

Reduced to its simplest form, this knack of keeping silver, china, linens, laces, upholstery, etc., at their best is nothing more than a knowledge of the possibilities of Ivory Soap.

Of course, special hints, sometimes are helpful such as the directions below for rehanging a lace door panel. But the one thing necessary is to realize how many things ordinarily never attempted with soap may be accomplished to entire satisfaction with the mild, pure Ivory.

Booklet of Unusual Ivory Soap Recipes Free

To suggest some of these unusual uses we have compiled a booklet of about 100 recipes received from various sources. These recipes will be found exceedingly interesting and exceptionally helpful. You may have a copy by asking for "Unusual Uses of Ivory Soap." Address The Procter & Gamble Co., Department 16, Cincinnati, Ohio.

To Wash a Lace Door Panel—First, wash the glass in the door. Then wash the lace in the usual way in a good suds of Ivory Soap and lukewarm water. Rinse well; then starch. Slip in rods while panel is wet, place in position on door, pull lace straight and let dry. This prevents shrinking and makes the panel look like new.

IVORY SOAP . . . .

Spring for Men

Styles

You are going to see some interesting things in our clothes for spring

FOR $25 and upward, you can buy clothes made from imported fabrics which formerly cost you considerably more. We are combining better fabrics with our fine tailoring at no increase in price.

The finest imported weaves which have heretofore been used for the costliest custom tailoring are available to us under the new tariff law. Stripes, plaids, black and whites, and gray and whites are some of the principal effects. Decorations are mostly in silk.

Style features of the new season are simple, yet striking. In young men's clothes, they follow the shape of the figure; no padding; wider lapels and collars; shorter coats, smaller sleeves, narrow shoulders, softer draping. Men's styles, while more conservative, tend in the same direction.

In our Style Book for spring, you will see all the new styles portrayed in a series of artistic and interesting pictures; you can ascertain where, in your city or town, our clothes may be seen and bought.

The Style Book will be ready about March 1st. The illustration above, a drawing by Howard Pyle, will be shown in colors on the cover of the book. If you desire a copy, write your name

ECONOMY Gasoline Engines

Our low prices are the result of modern methods of manufacture, enormous output and direct from factory selling. Our guarantee, "Your money back at any time if you are not perfectly satisfied," and our reputation for fair and square dealing make you sure of the quality of Economy Engines.

The following prices enable you to buy a large and a small Economy engine for less than the price of one *ordinary* engine.

1½-H. P., $29.95; 2-H.P., $39.95; 4-H.P., $72.95; 6-H.P., $102.95; 8-H. P., $149.65; 10-H. P., $219.50.

Turn to the gasoline engine pages of our new big General Catalog, see our complete line of sizes for every purpose. If you haven't our new big General Catalog, just write "Gasoline Engines" on a postal card and also request our free Catalog No. 73F71

EVERY Economy Gasoline Engine is required to pull more than its rated horse power before it leaves our factory. Every part of the Economy fits perfectly, which means less friction, less wear and greater economy of fuel. Duplicate parts are absolutely interchangeable.

The Economy is the simplest engine on the market. It has fewer parts, is easier to operate and is guaranteed to give as good service for as many years as any other make, regardless of price.

If you need a gasoline engine, you will purchase an Economy if you investigate thoroughly, because you cannot find its equal at anywhere near the price we ask.

Company in putting it up to the architect is bound to impress the architect favorably. The service idea in offering genuine information in the booklets is a very subtle and commendable appeal to the good-will of the house builders.

Appeal to the Sentiment by National Lead Company

In the National Lead advertisement a most effective appeal to sentiment has been made. The National Lead Company is fortunate in having a deep-seated prejudice in the minds of painters generally throughout the country in favor of lead and oil as against mixed paints. To maintain this sentiment and create an impression of being willing to give valuable advice when requested is good business judgment, and the results are unquestionably shown in the sales of the National Lead Company

Quaker Oats Advertisement Is Well Rounded

The Quaker Oats advertisement deserves special commendation. The economy of the 25-cent size is prominently brought out, but there is no sacrifice to the appetizing suggestion of good oats well cooked. In the fine type in the small paragraphs strong points that have been prominently displayed in previous advertisements are reiterated, and the cumulative effect, which is one of the most valuable assets of all advertising campaigns, is given additional impetus thereby.

The Holeproof Hosiery announcement is unusually effective in the use of the illustration. The fact that holeproof hosiery is made for men and women, with

especial emphasis on women, is brought out with two female figures in connection with that of one figure of the man.

The Ivory Soap advertisement is interesting in having so much space given to the illustration.

How Ivory Soap Creates Quality Impression by Fine Illustration

The problem of marketing a 5-cent soap is to continually create the atmosphere of quality to counteract the impression created by low price. The Procter & Gamble Company has undoubtedly shown great wisdom in the care given to illustrations. In this particular advertisement illustration and text are both strengthened by being used together rather than by giving all the space to one feature alone. The title of the booklet itself suggests greater service to people who are already using Ivory Soap, but might not be conscious that they could use it for other purposes than that for which they bought it.

New Style of Art Work in Hart, Schaffner & Marx Advertising

The Hart, Schaffner & Marx advertisement is an interesting departure from the style which was original with this house, and has been maintained many years in showing ideal figures of young men in natural positions with clothes that showed wrinkles and creases as they would appear when worn by a well-behaved human being.

The mail-order idea of giving more information to people who specially ask for it is the keynote of this particular advertisement. The effect of a fine style-book sent out to all who ask for it is far reaching.

Inquiries coming from high-class prospects handed to the traveling salesmen, and properly used by them in talking to local dealers, are bound to largely increase the dealers' own efforts to make use of the advertising helps which Hart, Schaffner & Marx sell their agents. I use the word "sell" because this house sensibly takes the ground that advertising material which is given away free is valued accordingly. A fair price to partially cover the cost of production is the best assurance that the dealer will make the most effective use of it.

The Mail-order Idea in General Publicity Advertising

In the mail-order line, I have reproduced three Sears, Roebuck & Company announcements (which indicate the wide scope covered by this most successful mail-order institution) and one of the advertisements of the National Cloak & Suit Company.

Comments on Mail-order Advertisements

The latter makes the most of the word "National" and also of its New York City location, which with a large group of buyers stands for that intangible something called style.

The Sears-Roebuck announcements are characteristic in the fact that the successful mail-order house seeks more than anything else to get the catalogue, which is the real salesman, into the hands of the people who have been induced to express a desire to possess it.

I have reproduced only one outdoor advertisement, and that is the White Rock electric sign, which

Mr. O. J. Gude told me was the best thing that had ever been done in that line.

Applying the Ten Tests to Outdoor Advertising

While it may seem hard to apply the ten tests to an electric sign, a bulletin, or a poster, I recommend making the attempt for reasons previously given.

Taking this electric sign, the White Rock for instance, the first test—"Is it institutional?"—is justified by the fact that this advertisement was placed on Long Acre Square, the night centre of New York City, the place to which come the largest number of free spenders from all over the United States.

How the White Rock Electric Sign Measures Up to the Ten Tests

White Rock as a trademark has been associated with sales talks and educational advertising all over the United States. Its reproduction here reiterates, reaffirms, and reinforces all that has been said about it. The night life of New York City is an institution in itself, and the White Rock sign, with its brilliant light, is in full harmony with this institutional spirit.

The advertisement is natural (test No. 2). The big words "White Rock" and the suggestion of moving water are double embodiments of this idea.

This electric sign is specific (test No. 3) because the White Rock trademark in its peculiar, distinctive form is accuratcly reproduced.

It is certainly timely (test No. 4), for when two hundred thousand or more people are out on the

street in a money-spending mental attitude, it is a good time to remind them that White Rock is a good thing to spend money on.

It is pertinent (test No. 5), because White Rock appeals to the men who imbibe spirits in suggesting a high-ball, and also to the people who want to drink something else that does not seem cheap or puritanical.

It is a consistent (test No. 6) announcement, in every way reflecting the spirit of the water itself, and the consuming group to which it belongs.

The suggestion of persistency (test No 7), of authority (test No. 8), of plausibility (test No. 9), and sincerity (test No. 10) are all contained in largeness, dominance, and location of the sign taken as a whole.

The sincerity of an institution that would spend so much money to tell the story in the way that it is done in this electric sign cannot be open to question. The story is certainly plausibly told, because the association of the phrase with the clock makes the broadness of the suggestion of "all time" more acceptable than if the clock itself were not displayed.

Authority is suggested in the bold, aggressive manner in which the sign itself stands out as against all other placards claiming attention, and persistency is suggested in the accurate reproduction of the trademark itself.

There can be no question that the orderly and sys-

tematic application of these ten tests to any piece of printed matter, or any announcement of any kind, displayed in newspapers, magazines, or outdoors, would result in more care being given to the work, and more thought along the line of serving the final buyer, and hence, bound to benefit the advertiser's business as a whole.

The Ten Tests Apply to Almost Every Kind of Advertising

CHAPTER X

ADVERTISING AND SELLING THROUGH THE ORDINARY CHANNELS OF TRADE

BROADLY speaking, there are five recognized routes by which merchandise travels from the man who makes it to the consumer.

Perhaps the most important are: *from manufacturer to wholesaler or jobber, from the wholesaler to the retailer, and from him to the consumer.*

The place of the retailer in the distributive chain is universally conceded. Mail-order successes prove that many kinds of goods can be marketed by mail; but the retailer will always handle the bulk of the supply of the American family.

The Retailer— the Biggest Link in the Merchandising Chain

His stock is complete, if he be progressive and easy of access. Merchandise can be seen before it is purchased. Very often the credit which the retailer can extend is a real service, which brings him a goodly share of the business of his trade territory.

The position of the wholesaler may not be so clearly defined. At first glance it might seem that the toll he exacts would better be taken from the sell-

ing price and his service dispensed with. It would not pay, generally. He has a function, and is indispensable in most cases. He keeps a finger on the pulse of local conditions. The manufacturer can afford to sell him at less than the price to the retailer, for the service he renders could not be duplicated by the manufacturer for the differential he allows the jobber.

The Functions of the Wholesaler

The wholesaler buys in much larger quantities than the ordinary retailer does. He relieves the manufacturer of all work and detail in connection with credits and selling small orders and collecting small accounts. He pays for what he buys and assumes entire responsibility for his own sales. He is particularly indispensable to the manufacturer of an article of comparatively small consumption. The volume of sales to each retailer is so small that it would be foolish for the manufacturer to do business with individual retailers, either direct or through salesmen.

The wholesaler is of great value to the retailer who is doing business on a small amount of capital. His stock is large. Retailers in his territory can draw upon it and get the goods at once; so that it is not necessary that they cumber their small space with large quantities of each of the lines they handle. He is safe in granting credit, because he is on the ground and knows the retailer's financial status.

The Wholesaler as an Aid to the Retailer

Some manufacturers selling privately branded

goods in staple lines of steady consumption give the exclusive sale of same to one jobber in a territory.

The Exclusive Jobber Plan

This gets more coöperation from the jobber, for if he has the right kind of a contract, he is building for himself as well as for the manufacturer. The exclusive jobber plan has been successful, especially when supported by general advertising. Specialties of small consumption have never been marketed advantageously through exclusive jobbers; this method is feasible only when it is possible to divert an established demand to an advertised, trademarked brand. It will not create a market for a novelty. It would not do for an unbranded article.

Most manufacturers sell to all reputable jobbers. They cannot expect them to put any special effort into selling their goods, because the jobber specializes on distributing, and is not equipped for creative selling. It is, therefore, the business of the manufacturer to create his own market—by advertising to the consumer, by interesting the dealer with specialty work, and by trade journal publicity.

The Advertiser Must Create His Markct—the Jobber Is a Distributor

Some manufacturers will put up goods under jobbers' private brands. But it militates against the manufacturer who wants to sell his own brands, and the one who sells bulk goods. It is, nevertheless, legitimate competition.

Many manufacturers sell direct to the retailer. It is hardly amiss to include in this classification the

manufacturers who maintain an extensive selling force to solicit the dealer direct. The orders which the specialty salesmen get are filled through the wholesaler, who takes over the accounts. He can fill the orders more promptly, he is better equipped for looking after repeats, and he assumes the retailers' accounts. These functions make his service worth while to the consumer, retailer, and manufacturer.

Selling the Retailer Direct

Almost all manufacturers of national products employing the wholesaler do some specialty work on retailers at their own expense.

The manufacturer who sells through an exclusive dealer eliminates the wholesaler.

Selling direct to *all dealers* can scarcely be said to lower the price to the consumer, or lower his own selling cost, or even to increase the retailers' profit. The manufacturer must take care of more detail in his office, must increase his traveling sales expenses in most cases, and must assume responsibility for retailers' accounts, which means more bad debts.

He may sell to retailers direct or through salesmen, and pocket the wholesaler's commission; but if he is after volume and big business, I doubt if he would save money by doing without a wholesaler.

Reasons for Selling Direct

The advantage of direct selling is that it gives the manufacturer a more intimate knowledge of selling conditions, a closer grip on his own business. It gives him the master's share, and the power to extend substantial coöperation, if

his product is good and his organization able to justify the sales expense by keeping up the steady sales incident to such expenditure.

Some manufacturers sell to both retailers and wholesalers. But if they sell a retailer in the logical trade territory of a wholesaler to whom they have also sold, there will surely be friction. To sell the retailer at less than the wholesaler's regular price to him is not in accordance with the ethics of the trade.

Large retail stores that go direct to a manufacturer and demand wholesale prices are another problem, if the latter is committed to the general policy of selling to wholesalers.

The third channel is through a third middleman, the *manufacturer's agent*, *broker*, *importer*, or *exporter*, as the case may be. He buys from the manufacturer and sells to the wholesaler, who sells to the retailer, and the retailer sells to the consumer.

The Third Middleman —Agent, Broker, Importer, or Exporter

The functions of the importer and exporter are fundamental. He gets goods from foreign countries and ships domestic products to markets where they can be sold. Only the largest and most complete wholesale or retail establishments are able, in their own organization, to take care of the particular service of the specialist importer or exporter. He sells to the wholesaler. He is seldom equipped for going direct to the retailer or the consumer. His margin of profit is small; volume is vital to his existence. Small sales do not interest him.

"Merchandise broker," and "manufacturer's agent," are practically synonymous terms. The merchandise broker differs from the importer or exporter mainly in that his work is intra-national instead of inter-national. He is the manufacturer's exclusive representative for a certain field. In this field he represents from two or three to fifty different non-conflicting producers. His margin of profit is smaller than that accorded the wholesaler; he is after volume. He makes it possible for the manufacturer more nearly to approximate a unit system of distribution.

Broker and Agent Practically the Same

The manufacturer's broker carries on most of the negotiations with wholesalers. All difficulties are referred to him for adjustment. He may have much to do with framing the general policy for his territory. He comes nearer than any other member of the distributive family (save the representative on salary from headquarters) to representing the manufacturer direct.

The broker seldom goes straight to the retailer. His commission will not permit it. He must go to the wholesaler, where each order means big business. If he does any work at all on retailers, it is for the purpose of influencing demand upon the wholesaler. Progressive firms which employ a broker and want to get the maximum volume of sales allow him to engage a specified number of specialty men; or they send specialty men to work for a time under the direction of the broker.

The Broker Sells the Wholesaler

These men call on retailers and stimulate demand upon the wholesalers by whatever arguments of merit, advertising, profit, or special coöperation seem best.

House-to-house canvassing of consumers, sampling, and store demonstration are means by which the manufacturer coöperates with the broker. The size of the manufacturer's organization, the amount of capital he has, and the universality of the appeal of his product must determine whether or not he will use brokers and the amount of coöperation he shall give them.

Selling the Consumer Direct

The fourth route is from the *manufacturer to the consumer*, with no intermediaries save the manufacturer's own representatives on salary or commission. This classification includes (1) the mail-order house, and (1a) the manufacturer selling by mail, and (2) the manufacturer operating his own retail stores or selling direct through agents or salesmen.

Mail-order houses are of two sorts. The primary purpose of one is to sell goods of its own manufacture, the business of the other is to sell goods by mail.

In the first class is the manufacturing house specializing upon a few articles; in the second, firms that maintain extensive manufacturing establishments, and also buy from other manufacturers materials to complete their very extensive lines.

There is the manufacturer, either of specialties or of articles of such a nature that it seems best to reach the consumer through a direct representative, who

receives from the manufacturer either a salary or a commission. The automobile maker who maintains agents or branches in different cities for the purpose of selling his output direct to users is an example. But if he allows his cars to be sold by an independent local sales company, he must be accounted as using the second trade channel—manufacturer to retailer.

The sale of advertised specialties has developed a type of manufacturer's representative who is not at all like the ordinary merchandise broker, who goes to the wholesaler with a sample, quotes him a price, and wires his principal the wholesaler's offer. The manufacturer's representative selling advertised specialties must be a creative salesman in every sense of the word. He must understand how to conserve the value of the trademark. He truly represents the manufacturer in serving the customer and does not compete on a price basis.

Introducing Goods to Consumers by Solicitors

Small specialties are often established by solicitors sent out from the manufacturer's office. Firms having only a small capital, and unable at the outset to advertise and sell in a big way, often use solicitors, for a time only, as a means of making the goods known and as a preliminary to selling through retailers. Specialties which are limited in appeal cannot be sold successfully by any other means. If the margin on them is small, the solicitor handles them as one of a number of articles which he is prepared to present to the consumer.

The Manufacturer Who Operates Retail Stores

The manufacturer who operates retail stores is also a direct-to-the-consumer seller. In his advertising he often lays particular stress upon the statement that he has eliminated the middleman's profit and can, therefore, make the consumer a better price.

It may be he can, but I doubt it. He has taken upon his own shoulders the burden of maintaining a more complex organization and of handling many men on the road. In other words, he cannot eliminate selling expenses by going direct to the consumer. He may minimize it, by perfection of sales equipment and the institution of economies in the supervision and conduct of his business.

Unless he is a wonderful organizer and a handler of men, he may find at the end of the year that his net profits are less, and that the public has fared no better. That does not mean to say that direct-to-consumer selling is not economical; but that the highest type of business ability is necessary if the manufacturer is to make a success of it.

Chain stores are not examples of manufacturer-to-consumer selling; they are organized retailing.

The Mail-order House

In the fifth case, the mail-order house, instead of going direct to the manufacturer, *buys from* his *sales agent*. This means the mail-order departments of large businesses whose chief concern may be either wholesaling or retailing, but which maintain mail-order sections. It also covers the buying of goods by a mail-order house

from an importer or exporter or a merchandise broker instead of from the manufacturer direct.

The conditions which control the production of an article, the amount of capital to be used for promotion purposes, the utility and value of the article itself, the distance which separates it from its market—all those things must be considered in choosing a selling method.

The Middleman Essential in Almost All Selling Systems

Almost all selling systems call for a middleman. Importer, broker, wholesaler, or retailer, whichever he may be, he is a helpful factor in distribution and has justified his existence. To market merchandise costs a certain amount of money, varying in accordance with the character of the merchandise and the ability and the amount of work that the selling organization will put into a campaign. A manufacturer who decides not to employ middlemen does so because he has developed—or is convinced that he can develop—within his own organization the distributing ability which is the primary function of the middleman. Whether or not he can do this on a less outlay than it would take for middlemen is a matter which he must determine for himself by trial.

The manufacturer must be a creative salesman, or surround himself with men who are, or his business will come to nothing. The middleman must be a producer—serving the consumer—or be eliminated.

Nothing that I have said in this chapter should be

construed as endorsing the idea that all merchandise going from producer to consumer, through all the five routes I have outlined, are the correct ones for the merchandise to follow. In many instances I believe radical changes in distribution should be made. There are manufacturers who sell to the jobber, through a sales agent; the jobber then sells to the retailer; the retailer then sells to the consumer. There are many articles handled this way which could be shipped in original packages direct from the manufacturer to the consumer, even if the sale were handled through two or three middlemen, and every party to the transaction be materially benefited and especially the consumer.

The Middleman's Functions Should Be Clearly Defined

The route of this distribution should be adapted to the character of the merchandise. The functions of the middleman should be clearly understood by himself, and he should not attempt to do things that other people could do better, more economically, and with greater satisfaction to the consumer.

There is need for radical adjustment all along the line, but the particular point that I have endeavored to drive home in this chapter is that it is possible for the manufacturer to reach the consumer, using all of the established routes of distribution, and the consumer hold the manufacturer responsible for the quality of the goods that he makes, and the manufacturer be benefited by the sense of responsibility which he feels toward the consuming public.

I recognize that many distributors are going to fight this change the same as the old hand compositor fought the introduction of the linotype machine. Yet, from my own experience, I know that linotype operators make from two to three times as much a week as they did in the very best conditions under the old system of hand composition. The same is true regarding many distributors—they have learned their business by blindly following customs as they found them. They have not analyzed and thought things out, and realized that there were better ways of doing business.

Many manufacturers blindly accept the idea that the middleman who pays them for their goods is their customer. Goods in the market are a menace to the man who has made them—goods are never sold until they are in the hands of the consumer—the final buyer, the man who does not want or intend to sell them again.

The Middleman Is Not a Consumer

Many distributors are recognizing the new order of things, and confining themselves to banking and purely distributive functions. They are not attempting specialty salesmanship when they can secure the coöperation of the manufacturer's men on this point, get more expert assistance, and make more money than they could by having a larger margin of profit and taking the responsibility on their own shoulders of doing necessary specialty work educating of the trade.

All along the line the distributive system is loaded

with heavy labor costs—usually the lowest priced labor is the most expensive for the purpose for which it is employed.

Advertising Confers a Double Benefit

Advertising can, in every line of distribution, be used to a greater degree to reduce the cost of distribution, and at the same time to increase the compensation of the necessary personal labor required to maintain the various distributive channels.

One prominent retailer, who is generally reported to figure his cost of handling merchandise to the consumer from his source of supply at 30 per cent. on the gross price, told me that over half of his expense was labor, and including clerk hire, management, delivery men, janitors, etc. He took pleasure in telling me that his advertising expense was less than 1 per cent. on his total business. I told him that I thought he was overtaxing the consumer with an expense of 15 per cent. in labor and only 1 per cent. in the form of informative advertising, which could unquestionably reduce the cost of salesmanship, when it had the intelligent coöperation of clerks trained to thoroughly coöperate with the selling campaigns, of which advertising should be a more important part than at present.

This same condition runs through the jobbing business. Many men unpack and handle goods and pack them up again, which, if standardized, and the consumer educated to want them in exactly the form in which they left the manufacturer, could be shipped

direct from manufacturer to consumer, but bought intelligently in a retail store from well-displayed samples.

There is tremendous opportunity for improvement along these lines, and I predict that the next ten years will see changes that might be characterized as revolutionary. I still affirm that the regular established channels of trade will be maintained fundamentally along the same lines as they now exist.

REFERENCES ON CHAPTER X

There are trade papers which deal with the problems outlined in this chapter, many of them. Some are of unquestioned leadership, with offices in all important trade centres.

Particularly noteworthy are the *Dry Goods Economist* and *Iron Age* (both published in New York), which are edited by men of great power and national influence.

There are five (monthly) publications for undertakers and eight for miners. The grocer, the general merchant, and the allied trades are served by sixty-eight publications. And so on down the list, from automobiles to watchmaking. Each one of these trades has its own literature, to say nothing of house organs and catalogues which display the highest type of advertising skill.

CHAPTER XI

RETAIL ADVERTISING—PREPARATION

IN CONSIDERING retail advertising, one must not forget that many merchants have gone into business without any carefully laid plans in anticipation of what they were to do. Many men have inherited the business—others have started in as clerks, and gradually worked up.

In the agricultural districts are retired farmers who came into the towns to educate their children, and many of them engaged in the grocery business or dealt in agricultural implements.

The numerous failures reported throughout the country tell a graphic story of unpreparedness, lack of expert knowledge of the business itself, and especially of the characteristics of the consuming public.

Perhaps at this point I may be justified in digressing a little and expounding one of my pet theories in reference to the United States Government, making as far as possible a constant demand for labor. In 1896, when Secretary Bryan was urging the free coinage of silver, I wrote an article which was published in the Chicago *Record*, on the free coinage of labor. It will be found in Appendix No. 1.

A Stable Labor Market Necessary to Successful Retailing

I have never been able to become very enthusiastic over the idea of the Government going into business except on such natural monopolies as the Post Office Department and Government savings banks, where, especially in the latter case, the people could have protection and absolute security, and in times of panic would not hoard their money to the serious detriment of business.

Government Should Operate Natural Monopolies

The American people are too prosperous as a whole and too kind hearted to permit any human being to suffer for the want of food and shelter or raiment. If labor is not performed in exchange for these three fundamental needs of human nature, then society as a whole must bear the burden. Organized charity will provide for anybody who absolutely suffers for the lack of food, clothing, or housing. But society, as a whole, should have the benefit of the labor that every human being can perform.

It is a little short of a crime to have idle men at any time, especially when they really want to work. This condition is an indictment of the business ability of the American people to so manage their own economic affairs as to provide for their best interests. I have often thought that if the United States Army would enlist men for a six months' period, put them to work at road building, pay them handsomely for it—this would be the surest method of establishing a minimum wage for labor throughout the country, and at the same time

The Crime of Contributory Idleness

would ensure the general public as a whole getting the benefit of all work from people who were willing to work. Unless the Government does this, it means that retailers must always carefully consider the labor conditions in any section in which they wish to do business. Industries in which men are liable to be out of work for long periods of time make the retailing in such sections very precarious. The merchant cannot forecast, as he should, his purchases, and at times he is absolutely forced to take on serious credit risks.

Other things being equal, the retailer should prefer a location in a city where the industries are largely advertised. Manufacturers who use advertising to create a permanent, steady market are least affected by industrial changes. Employees are benefited by this policy, as in times of general depression they are not laid off.

Once having determined on the location, if such is within the option of the retailer, the next thing to do is for him to decide the particular street upon which he will locate his store.

The Location Within the Locality

Here again we see the value of the group spirit: this accounts for the fact that so many square feet on the corner of State and Madison streets in Chicago are worth many times more rent than identically the same amount of space one mile therefrom.

The fact that a large group of people have formed a habit of passing a particular corner, or along a par-

ticular block, every day, is the reason why a location at that point is worth more to the retailer than the same amount of space a short distance away.

Appreciation of Mental and Physical Conditions

The retailer, after securing his location, should then consider the characteristics of his group as a whole, and also those of the many smaller groups of which the community is composed. He should study their tastes, their prejudices, the influences that are at work to maintain or change their mental attitude and their method of living. The retailer should select his clerks carefully from the viewpoint of their fitness to harmonize with the tastes of the majority of his customers. Much could be said about fitting up his store so that everything would be convenient of access. Ample opportunity in the way of showcases, counters, and shelves should be given, after being carefully thought out, for the display of desirable merchandise. Mute salesmanship of this character costs little money but brings substantial results.

Buying Should Be Concentrated

The retail merchant should buy reliable, dependable goods. It is always better to concentrate his purchases to as small a number of sources of supply as possible in order to make his business worthy of being sought by the best houses, and in this way insuring the largest amount of attention. Where the quality of merchandise or the general policy of the houses from which the dealer can buy his supplies, is the same, then he should, in justice to himself, give the pref-

erence to the salesman who studies his needs and who is best equipped to counsel and confer with him on how best to merchandise the goods that the dealer buys from him. There are many dealers who owe much of their success to the counsel and advice and careful study of their business on the part of salesmen who regarded their line of work as an opportunity for service, and who valued the dealer's confidence in their judgment as a sacred trust.

After a dealer knows the purchasing capacity of his possible customers, he should endeavor at all times to bring them up to an appreciation of a little better standard than they naturally would ask for. In this way he secures the leadership which is necessary for him to build up his business, and to secure and hold the trade of people who like to feel that they are appreciative of quality and that goods have been brought to their attention because of that fact.

Comparative Value of Advertised and Unadvertised Products

The retailer should always put in advertised goods when they are of equal merit with the unadvertised lines. If he can buy other goods for less money, which in his judgment are equally good as the advertised line, then he should determine how valuable to him is the advertising on the higher priced line. If he can figure that this advertising will save him clerk hire, rent, and other expense, then the advertising justifies itself. As a rule, however, the advertised lines are generally meritorious, and the cost of advertising is not borne by the consumer. In this case the

dealer has no excuse to do anything else but handle the lines that are advertised.

Exclusive Agency

Careful discrimination should be exercised by the retailer in taking on exclusive lines of goods. There are many manufacturers who use this method of marketing their goods, because they know the thought of having something that one's immediate competitor does not possess appeals to retailers generally. Often retailers make a mistake in listening to this argument, for there are articles of great national sale which are open to any distributor who will buy them, that unquestionably give the greatest satisfaction to the final consumer because of the advertising which has been done in advance, and which is continued after the purchase has been made and the buyer's satisfaction ensured in every possible way.

National Prestige and Local Reputation

Retailers often make the mistake of trying to substitute an article on which they have exclusive local sale against one that has a broad national sale. As I have tried to show in other chapters in this book, a manufacturer who can get control of the market and reduces the price to entrench himself therein unquestionably gives the greatest possible service to the final buyer. I do not know any of these manufacturers who have reduced their prices who want the retailer to handle goods without a satisfactory profit. In fact, so far as I know, all of these agitations that are being waged, which advocate legislation in Con-

gress in favor of permitting manufacturers to insist on retailers maintaining their prices, are done by the manufacturer. He wants the retailer to make money, and he does not want to reduce the retailer's profit. He knows that if he can get the largest possible volume of distribution, he can, in the economy of manufacture, reduce prices and entrench himself against competition in his own field. He knows that price-cutting on the part of the retailer reduces the volume of total sales, and that the retailer cannot render the consumer the best service unless he is sure of regularity of demand.

Analyze Selling Costs

Retailers often make a mistake in spreading their expense of doing business over all the articles they sell. For instance, it certainly costs a retailer more in rent and labor and overhead to serve a glass of soda at 5 cents a glass than to hand out a package of chewing gum, the demand for which has been created and developed by large national advertising.

The retailer fools himself if he thinks that the washing of the glasses, the labor in dispensing the soda, and the amount of time taken up by people standing at the soda fountain is anything like the same degree of expense to him as the transaction involved in handing out the chewing gum. All he needs to do is to figure how many sales a clerk could make to people who came in and asked for chewing gum, provided they came in all day in somewhat similar manner to which the patrons of an elevated

railroad go through the gates and drop their tickets into the ticket-dropper receptacle. The elevated railroads—a large institution—furnish a good deal of transportation for 5 cents as well as covering the labor of people who sell tickets and receive them at the gates.

This analogy applied to advertised goods explains why many merchants are so successful who take hold and coöperate with the national advertisers in the distribution of these goods by pushing them.

Coöperate with National Advertising

The retailer can use every advertising medium that I have described in this book. Many of them he can afford to use directly. He could get the benefit of all of them indirectly by cashing in on the manufacturer's advertising on goods that he distributes exclusively in his own section, or by coöperating with the big, heavy, national advertising campaigns on goods that are not confined to any particular store, and by doing this, he will get more than his ordinary share of the business which the manufacturer is creating. The dealer should do no advertising until he is ready with the goods to back up all that he promises in his advertising.

REFERENCES ON CHAPTER XI

Mr. Harlow N. Higinbotham, formerly a partner of Marshall Field & Company of Chicago and president of the Chicago World's Fair, has written a valuable book entitled, "The Making of a Merchant," published by Forbes & Company, Chicago, 1911.

Advertising has developed greatly as a service factor since Mr. Higinbotham was active in business. He recommends unadvertised lines as giving the dealer a greater profit. To-day he would find that the manufacturer's advertising on many lines saves the dealer clerk hire, rent, and brings him business.

He recommends retailers to teach their clerks to be decisive in dealing with customers, and aptly says: "When the decision is put up to the customer he will invariably name the brand most widely advertised, because it is the first that comes to his mind."

CHAPTER XII

RETAIL ADVERTISING—METHODS AND MEDIUMS

THERE is no argument needed to convince any one that if people come to a store, make their selections, and allow the proprietor to deliver goods through an organized delivery method, that they can secure more for their money than if they make purchases from peddlers.

The first purpose of advertising on the part of the retailer should be to bring people into his store.

The people who pass the store every day are influenced better by the store window than any other medium that could be used. Goods should not only be attractively displayed but should be marked with prices. In this way the effect of the advertising in the store window can be accurately checked up.

The same clear-cut fundamentals govern the success of a department store and a fruit-stand. Each exists, primarily, because of a group. Each has been established in a locality to which common interests and needs draw a group of people constantly.

In polishing his apples, arranging the grapes and cherries in small packages, and putting in his spare

time making up attractive assortments, the fruit-seller shows the same elemental appreciation of the advertising value of display which is revealed in the department store's handsome windows, neat shelves and counters, and carefully trained clerks who impress all comers with the fact that "it is a pleasure to show goods."

Attract Favorable Attention

The price ticket on a basket of grapes is at once an appeal to the bargain-hunting instinct of the suburbanite and constantly a confidence-compelling affirmation by the proprietor that the goods are worth the price asked, and that he is willing for any one to know it.

This same fruit vendor has found out that he can depend upon a certain class of discriminating trade *if* he sells well-advertised goods in the original unbroken package. Many a small store proprietor would do well to follow his example and display them in his windows.

A retailer in Chicago recently moved his store and paid $15,000 more a year for rent for identically the same space he had before. In the new location he had six show windows, as he took a corner, where before he only had two. It is a question whether the class of people or the number which pass the new store were any different than in the other. The $15,000 additional rent was more than justified by the four additional store windows. These windows were constantly changed with goods attractively displayed.

After the store windows have been used to bring people into the store, it goes without saying that goods should be attractively displayed inside the store, not only to interest people, but to stimulate their desire to purchase. This mute salesmanship, employing the power of suggestion, often makes more sales than a clerk can do by trying to talk people into buying.

Inside Store Display Essential

The very best medium that a retailer can use to bring people into his store that do not regularly pass by his location, is the newspapers. A retailer who knows how to use a local newspaper and get a prompt response is very fortunate indeed.

As I have said before, it isn't necessary to advertise bargains all the time. It is wise for the retailer to regularly and systematically impress upon the readers of the newspapers the fact that he sells dependable goods, and he stands back of everything offered in his store.

In only one way has modern business improved upon the method of the late Mr. A. T. Stewart, who used to stand at the front door of the store, greet his regular customers by name, and occasionally slip into a package a tape-line, a spool of thread, or some other useful little article, for good measure. The improvement is the change from a personal to an institutional business, the result of emphasizing the fact that the business is being conducted according to such sound merchandising

The Chief Improvement in Modern Business Is the Change From a Personal to Institutional Business

principles that the constant personal presence of the owner is not essential to perfect service. The one-price system and the "money-back if goods are returned within a reasonable time" have gained the confidence of the public. This thought should be continuously reiterated in the retailer's newspaper announcements.

One of the best ways in which a retailer can use his local newspaper is fully described in another chapter headed "National Advertising and Exclusive Dealers."

Where the retailer has exclusive sales of a nationally advertised specialty, it doubles the value of his own newspaper advertising by connecting his store with the national magazine advertising of the manufacturer.

There are many advertising mediums which the retailer should absolutely refuse to use. I refer particularly to those that are of a semi-benevolent or semi-charitable character.

The Retailer Should Be Able to Say No

The retailer should make an advertising appropriation of from 3 to 5 per cent. of his total sales and then spend it as if it was the money of somebody else that had been entrusted to him to accomplish the best that could be done with it. The retailer who looks at his advertising appropriation in this way will not use the various schemes that are continually being put up to him.

There are men who go around the country enlisting the retailers to advertise in their own local newspa-

pers on schemes that make the solicitors enormous profits. This, however, is being relegated to the past because of increased appreciation of the value of good advertising methods on the part of the retailer and the newspaper publishers.

The retailer should not buy calendars or novelties or devices of any kind unless he knows in advance exactly how he is going to distribute them.

The Plan More Important Than the Medium

The very best way to distribute anything of this kind is to have people come into his store and get them. He should have a distributing plan in the form of newspaper or mail advertising to accomplish this before he buys.

If a retailer feels that he must contribute something to a local church organization, or a lodge, or some other semi-benevolent enterprise that approaches him for an advertisement in a program, he ought to, in some way, find a method by which he could contribute the equivalent of this money in the form of merchandise which people would have to come to the store to see or to derive any benefit therefrom. It would take several books to record all of the clever ideas that have been worked out along this line. There are trade-papers and special advertising papers that are continually recording these things, and it is not the function of a book like this one to go any further into detail.

The dealer should, at all times, have his store in such an attractive condition that it is profitable for him to have people visit it.

I have previously pointed out that the big department store is in the best position to use local newspapers. Fortunate indeed is the retailer in a town that has a good local newspaper, circulating entirely in his trade territory.

An entirely different problem is presented to the neighborhood retailer in a large city or to the suburban dealer who has no local newspapers whose trade territory corresponds with his own.

These suburban storekeepers, especially grocers and druggists, are just now discovering that if they display wares which are being widely advertised in newspapers and magazines that circulate in their neighborhood, they can cash in on this advertising identically as if it was their own.

How Suburban Retailers Can Cash In on the Manufacturers' Advertising

A number of newspaper publishers realize how important it is that these retailers who cannot afford to advertise themselves know how to benefit by the manufacturers' general advertising.

No department store proprietor would even think of advertising a special line of goods, unless his clerks were properly educated and specially coached how to coöperate with the advertising when the people came in to see the goods. All retail stores can use the manufacturers' newspaper and general advertising, without paying for it, by merely coöperating with it. The retailer who knows what is good in newspaper and magazine advertising, who knows the circulation of the general mediums in his ter-

ritory, can realize on the manufacturers' advertising just as completely as if he was paying for it himself.

How the Retailer Can Remove Doubts

If he is in doubt as to the amount that is spent by the house that sells him, he can get accurate information by applying direct to the publisher, or to any large advertising organization that coöperates with national advertisers in preparing and placing copy.

Some retailers have been imposed upon by advertising promises that have never been realized, and have erroneously assumed that all advertising is alike, and that one manufacturer's publicity is no more valuable than another's. No part of the retailer's education is more important than that he have an accurate knowledge of advertising mediums, both national and local. This will enable him to discriminate between the manufacturers who use advertising to serve the consumer, and reduce the cost of distribution, and those who try to bluff him by making him think that the advertising is being done on a larger scale than is really the case.

The better grade magazines, newspapers, and class publications are exercising close censorship over the manufacturer who does business along questionable lines. Many publishers will not accept copy unless they know that the advertising is sincere, straightforward, and done with the idea of benefiting both the consumer and the distributor. Just as any banker will give an opinion of any worthy investment, so any advertising house of standing will verify the

claims of the reputable advertiser. Dealers certainly should not give their coöperation where this is lacking.

Plan Your Work—
Work Your Plan

In closing let me reiterate that a dealer should sit down at least once a year and map out for himself a definite, tangible, complete campaign. He should know exactly how much his appropriation is, and he should spend it as if it was somebody's money that had been entrusted him to get the very best results from. He should be regular and systematic, and he should use all of the means that are placed at his disposal. He can have all of the exhilaration of the chemist who works in his laboratories, the satisfaction of the mathematician that solves problems, the zest of the hunter, and the calm satisfaction of the man who makes plans and sees them materialize.

REFERENCES ON CHAPTER XII

Very many books have been written about retail advertising. Correspondence school courses are largely concerned with writing advertisements for retailers. A number of houses furnish a syndicate service in the form of ready-made advertisements selling one dealer in a locality.

In almost every city of 10,000 population or more there are one or more advertising agencies or advertising service bureaus which make a specialty of writing copy for retailers. Practically every paper covering retail trades has a department devoted to retail advertising.

The live daily newspapers, in metropolitan and provincial cities, are the best primers for the man who wants to study the best, latest, and broadest aspects of retail advertising.

Mr. George M. Reynolds, president of the Continental and Commercial National Bank of Chicago, states that when a boy in a small Iowa town he subscribed for the great newspapers of our large cities, in order to keep constantly in touch with the outside world.

CHAPTER XIII

RETAIL ADVERTISING—MAKING GOOD

AT AN exhibit of farm vehicles, once, I heard a barker point out clearly the institutionalism of banking and merchandising, and the labor-saving value of trustworthy methods of doing business, in his reply to a couple of farmers who were chaffing him about his sales talk for the buggies he was demonstrating. They told him he was the most interesting liar that they had ever heard. He turned on them and quickly said: "You are honest farmers, but you have a peculiar way of showing your honesty when you do business with each other. You trust your bankers with your money without question. You let your wife and children trade with your local merchants and it never bothers you at all, because you know they will be given a square deal. But I notice that when one of you wants to buy a horse or a calf or anything else from another farmer, this is never delegated to anybody. You always do the work yourself. You are honest, you certainly are, and you show it in the way you trust each other."

The particular point in this story is the fact that the dealer is expected to be honest and trustworthy

as a matter of course, and there can be no doubt that his influence, prestige, and permanent position in the field in which he is doing business are in direct relation to the size of the group that has this kind of confidence in him.

Maintaining Confidence Increases the Dealer's Assets

I have outlined in chapters XI and XII that the retailer should be prepared, and that he should use advertising mediums to accomplish a specific purpose. But after all this has been done, there remains an additional responsibility which in my judgment is worthy of a separate chapter. And that is the idea of making good on every advertisement that the dealer puts out.

The retailer who gets the most out of advertising is one who regards every advertisement in the same light that he does a note that he gives to his bank or to a house that supplies him with merchandise. He has invited the public to his store and put himself in the same position of a host who is giving a dinner party. If people come to the party and nobody knows about their coming, and there is a hurrying and scurrying about to put extra plates on the table and apologies for the lack of preparation, the guest naturally feels that he was not really desired after all.

It is of the utmost importance that the advertiser back up his advertising with the same sincerity that he expresses in his announcement. Clerks must be trained to appreciate that the word of the store has

been given, and that any failure to make good on their part is a very serious offence.

Inviting the Return of Merchandise Increased Profits

One of the most successful heads of a big department store that I know believes that he cannot possibly cash in on his advertising unless he maintains the confidence of every one who comes into his store to an extreme degree. As an instance, he told me one day, when I called on him, that the man who had just left his office was the manager of his shoe department, and he showed me with great satisfaction a report that his manager had just left with him. He explained that three months before he had called on this department manager and told him that the percentage of returned shoes was too small. The subordinate mentioned that he had expected commendation instead of criticism for this, and insisted that wherever there had been the least reason he had permitted shoes to be returned and the money refunded or other shoes sent out in place of them.

"You certainly don't want to let a girl come in here and get a pair of fine dancing shoes, wear them all night, and come in the next morning and change them for everyday shoes," the department manager protested.

"That is exactly what I do want. Those girls have fathers and mothers who undoubtedly do not approve of what the girls do, but they will feel kindlier toward us when they find that we are indulgent with their children. Try it three months and see."

The report showed an increased volume in sales in the shoe department that the head of the store figured was due to no other reason than greater liberality in the matter of returns.

"Taking Back" Goods the Dealer Did Not Sell

On another occasion, I called with a salesman representing a large paint house on a prominent store. The keen eye of this salesman picked out a small can of paint that was lying on the floor and asked the manager if he handled this particular brand. The manager laughed and said: "No, but a woman came in here this morning and said she had bought this can from us and didn't want to use it, and so, of course, we took it back without argument."

This was certainly an extreme case, where a department manager allowed the customer to say that she had bought an article that he had never had in the store and gave her the money which she claimed to have paid for it. It illustrates, however, the idea that the state of mind of the customer toward the store is of the utmost importance and cannot be trifled with without detriment to the group spirit, which is really, after all, the essential character of the store.

The Power of Service

Service to the customer should be the beginning, the expression, and the "follow-up" of every advertisement.

Attractive window, counter, and floor displays, which remind and inform passers-by, are true service factors. They economize the time of the consumer and dealer.

Courteous, prompt, and intelligent attention of

salesmen who know their stock, and having constantly in mind the satisfaction of the customer, is the only good-will asset which will bring trade from a long distance and hold it in spite of price competition.

Retailers who sell service have no mail-order competition, and they do not advertise the mail-order business even by discussion.

When we can be sure of price maintenance on nationally advertised goods, we shall have reliable merchandise at lower prices than ever before, because of economy in wholesale production, unimpeded movement to the consumer, with minimum cost of salesmanship on the part of distributor and dealer. The retailer who advertises bargains is not giving his customer a square deal if he sells an advertised product of merit at a price less than the legitimate cost to distribute the same. The retailer is not giving the consumer, who is his customer, the service or the protection to which he or she is entitled when he cuts prices on advertised goods with the sole idea of making a profit out of selling other goods on which the margin of profit is abnormally high.

Price Cutting Benefits Nobody

I recognize that the statement that the retailer should maintain in all cases the prices that the manufacturer puts on the goods to be sold to the consumer will be open to question. I want, however, to make myself perfectly clear. There are, especially in the drug field, lines of goods on which the profit is marked abnormally high for the retailer. On the theory that

all business should benefit the consumer, we cannot exploit him by asking him to pay more than the service is actually worth. Many of the cut-rate drug stores are performing a legitimate function, but they are giving the people a wrong impression regarding cut prices. The fact of the matter is that the retail margin scheduled by the manufacturer was too high in the first place, and most manufacturers do not expect these margins to be maintained.

There can be no question, however, that on nationally advertised goods of genuine merit where the price for distribution has been scientifically fixed, the retailer will do best to coöperate along these lines. He cannot be true to his customers if he creates the impression that he is selling all goods on the same narrow margin that he does advertised goods of real merit when he cuts the retail price on them. On the other hand, he cannot command the coöperation and support from the manufacturer in developing a larger volume of business when he interferes with his scientifically developed plans to benefit the consumer.

This brings up a question that might as well be discussed here as anywhere, and that is whether the price that is charged for many goods is worthy of the service the buyer receives.

The Difference Between Intrinsic, Real, and Commercial Value

For instance, there are many conscientious people who believe that any business in liquors, tobacco, and luxuries generally is an economic waste and a burden to the public. There are others who believe that the sale

of patent medicines is detrimental to the interest of the people as a whole. There are others who do not believe that investments should be advertised at all in themselves, but that advertising in connection with investments should refer wholly to the integrity and the ability of the banking house or investment institution that sells the securities.

We must recognize that intrinsic value, real value, and commercial value are entirely different things.

I would define intrinsic value as that quality in articles which scientific expert buyers would determine by tests. Alcohol used in the arts might be intrinsically more valuable coming from one distillery than another. Yet in the minds of many people, alcohol has practically no real value.

Real value is something that without question contributes to the benefit of the human race as a whole. There is no question that pure water possesses real value. There might be some discussion as to the intrinsic and commercial value of pure water. These differences of opinion would depend wholly on the relation of other things connected with it.

Commercial value is that quality in an article that creates satisfaction. Satisfaction is the test of every purchase. When the consumer is satisfied with his purchase we may safely say that the article that he bought possesses commercial value, and necessarily that is the basis on which we must discuss the question of value in its relation to advertising.

The point has been made that the department store and its very attractive advertising has raised the standard of living to such a point that many people want luxuries and justify the possession of them on the theory that they are actual necessities. It has been pointed out that the most valuable work for the community as a whole has been done by people who endured privation rather than by those surrounded with luxuries which take time to enjoy as well as require heavy expense to maintain. I have never been able to see how advertising could in any way be responsible for creating a condition that would be injurious to the people in any degree. Perhaps I should qualify that by saying that truthful advertising could not injure the people in any possible way.

Will Service Become Too Costly?

Fortunately, the movement for truthful advertising has been brought about by advertising men themselves who realized that advertising's greatest value would be demonstrated and developed by having it always dependable.

The insiders in advertising have asked that the law take cognizance of the benefit of truthful advertising and discipline those who do not follow the lines of their best interests.

From intimate observation of a number of captains of industry I have made up my mind that they get little more in exchange for their arduous efforts than shelter, clothing, and a very modest amount of food. These men work under self-imposed privations be-

cause they can accomplish the big work they are doing better by following such methods.

The Desire for Luxury Stimulates Industry

Booker T. Washington is authority for the statement that until the negro is aroused to the desire to possess things that are generally conceded to be luxuries, he cannot be stimulated to scientific and fruitful methods of industry. I am sure that the cultivation of domesticity—the beautifying of the home, making it a more comfortable place to live in, the possession of works of art, and the consequent care in preserving and caring for them—has its reflex upon the community as a whole.

Personally I am not afraid of the extension of the service idea on the part of our big department stores, where it is true that the cost of concerts, lectures, rest rooms, and long-range deliveries must be covered in the price that people pay for merchandise. There are many compensations resulting from this method, but the best protection of its abuse lies in the fact that large national advertisers are competing with each other to give to the consumer or final buyer the greatest possible service for the amount of money he spends.

Service Competition Invites Coöperation

This force is at work apparently at the present time in competition with the big department stores, though there are signs that some of the larger and better managed department stores are seeing that there is a basis for coöperation with the large national advertiser. If the department store refuses to distribute

the large national advertisers' products because there isn't sufficient margin to pay for all of this service, these goods will be distributed by smaller stores located closer to the consumer. This is competition along service lines that cannot help but benefit everybody that is engaged in it.

Advertising Will Bring Needed Reforms

Advertising can—and I predict will during the next ten years—accomplish many reforms. It is going to show that the buying from peddlers is an unnecessary tax upon the people as a whole; that the time of these canvassers could be better spent in more productive labor for the community.

Advertising is going to prove that food products handled in a sanitary way will not only eliminate the waste due to sickness, the result of unsanitary conditions, but that the possibility of doing things in a broad, large way will increase the market, and wherever markets are increased the proceeds of a day's labor always buys more.

Advertising is the most dependable force which we have to-day to overcome the ups and downs of labor conditions.

It is very seldom that the large national institution that markets its goods through advertising channels lays off men.

As a rule, the well-managed business is continually adding to its force of operatives and is doing business along steady, stable, permanent lines.

The large national advertiser necessarily has to be

a student of general conditions, and he prices his goods to the consumer on the basis that will take care of the fluctuations of raw material. There is no argument that stable conditions are better for industrious people than any other kind.

Stable Conditions Insure Prosperity

We need only go back a few centuries and realize in what a low state agriculture was when the castles along the Rhine and the shores of the Mediterranean were inhabited by warriors who protected the tillers of the soil from pirates, but at a price which gave a very slight return indeed to the farmer himself. This should be contrasted with the continued prosperity of the six million American farmers of to-day. This is an unanswerable argument in favor of stable conditions.

There is no force at work in America doing more to establish and maintain stable conditions than advertising.

REFERENCES ON CHAPTER XIII

Particularly recommended is "How to Run a Store at a Profit" (the System Publishing Company, Chicago), from which the following suggestions for the retailer have been culled:

1. Fixed price articles carried as an accommodation ought to at least take care of themselves.

2. Newspaper advertising appropriation should be from 3 to 5 per cent.

3. Carry the right amount of stock and no more.

4. Watch your overhead expense. Overhead is frequently figured incorrectly or charged incorrectly.

5. Know at all times what percentage of your profit is actually net.

6. Have your goods so arranged and displayed that the minimum amount of time is necessary for laying them before the customer.

7. Keep a record of the percentage of the selling price lost by mark-downs.

8. Look out for negative expenses. They are: poor displays, dingy stores, insufficient light, heat, or ventilation, ice on sidewalks, discourteous or inattentive clerks, etc.

9. In buying forget that you own the store and regard yourself as the purchasing agent for your community.

I also call attention to the "Retail Merchant's Ten Commandments," which were published in the *Monthly Bulletin* of the National Association of Credit Men, 41 Park Row, New York City:

1. Confine purchases to as few houses as possible.
2. Do not overbuy.
3. Take all discounts and pay all bills when due.
4. Have some books, especially an accurate expense account, a daily sales record, a book showing purchases, with cost and when due.
5. Carry enough insurance.
6. Make accurate reports to the commercial agencies and answer all letters.
7. Keep a clean, well-arranged store.
8. Do as much cash business as possible.
9. Do not make unjust claims.
10. Live within your means.

CHAPTER XIV

MAIL-ORDER ADVERTISING

ADVERTISING is most competent when it serves the consumer in the distribution of worthy merchandise through the natural channels of trade.

Some people think that the mail-order business is an illogical and unnatural business, because it eliminates the jobber, the traveling salesman, and the retailer. It is not. It is the direct result of intelligent and adequate advertising. No one can fully grasp the power of national advertising and merchandising through the natural channels of trade until he clearly comprehends the possibilities and the limitations of the mail-order business.

Total Mail-order Business of United States $2,094,000,000 per Year

Two great mail-order establishments in Chicago are credited with a combined annual business of $113,000,000 for 1913.*

The total mail-order business of the United States has been estimated to be $2,094,000,000, or about $22.76 per individual.† During 1912 the Ameri-

*Quoted from December Boston *Traveler-Herald.*

†These figures were given me by Mr. C. C. Parlin, who has been making an extensive research, recently, for the Curtis Publishing Company.

can family spent $785,000,000 for men's clothing, $600,000,000 for women's clothing, and $1,125,000,000 for children's clothing. The total, $2,510,000,000, is a little more than $27 per capita for the 91,972,266 people of the United States according to the census of 1910.

There are 20,689,000 families in the United States. Their income is about $27,000,000,000. With twenty-seven billions coming in and only two billions going out in mail-order business, there is a chance for our 790,886 retailers and the 42,293 wholesalers who look after their needs to do an excellent business.

Plenty of Room for Both Mail-order and Dealer Business

There are 2,164 towns of 2,500 people or more in the United States, having a total population of 41,140,847. More than 42,000,000 people live on our 6,361,502 farms. This leaves about 8,000,000 in villages of less than 2,500. Our 42,517 rural mail routes serve 16,199,000 people. These figures suffice to prove that there is a natural and strictly legitimate place for mail-order business, and it is bound to increase in volume each year.

Mail-order Business Natural and Legitimate

A large wholesale jobbing house has recently been estimating the cost of doing business with three classes of merchants, i. e., those located in towns of (1) less than 2,500 population, (2) between 2,500 and 25,000, and (3) 25,000 and up. They found out that it does not pay to send a traveling salesman with a full line of samples to a town whose population is

less than 2,500; and that unless the merchant himself goes to the market often, he cannot meet mail-order competition, for his merchandise will not satisfy the wants which the newspapers and magazines have aroused by the story of what is newest and best in the large cities.

The Live, Wide-awake Merchant Has No Fear of Mail-order Competition

For many years I have been asking my dealer friends this question, "Does a live, wide-awake local merchant who comes to market at least twice a year fear mail-order competition?" I have still to find an instance in which a good merchant was not able to meet and overcome it. Mail-order business depends on the inadequacy or incompetency of local merchants or serves a class of people so widely scattered and having wants and desires so occasional that it would not pay the local merchant to consider them.

The Field That Mail-order Advertisers Serve Better Than Any One Else

This, it seems to me, is the rightful field of mail-order business, and retailers and mail-order houses are recognizing it. It includes courses of instruction by correspondence, awarding premiums for the sale of soaps, perfumes, teas, and coffees to one's neighbors, buying diamonds and household furniture on the installment plan, and all kinds of farm utensils, building materials, bicycles, buggies, pianos, piano players, and the like. Dealers in poultry and poultry supplies, and subscription agents have been especially successful with mail-order methods. The

purchasers are so widely scattered and the lines so seasonable that it does not pay the retailer to stock them.

Many Nationally Advertised Lines Started in a Mail-order Way

Quite a number of nationally advertised lines of merchandise were started in a mail-order way. When a group of influential consumers had been developed, the agency for the line was given to a local retailer, who coöperated with the national advertising. This plan has been most economical and successful in introducing such articles as card-index cabinets, sectional bookcases, guaranteed hosiery, tailors-to-the-trade supplies, washing machines, safety razors, typewriters, and cameras.

Each mail-order house builds its own consumer group. The sum total of these small groups constitutes one great group which buys by mail. There are a number of publications of national circulation whose subscription lists are the result of sending circulars through the mails. There are some which are called "mail-order papers."

Choosing the Medium for Mail-order Advertising

Those who subscribe by mail are not likely to buy by mail. In Augusta, Me., a city of 13,000, two publishing houses send out, each day of the year, an average of more than a carload of mail-order matter. To look through the advertising columns of these publications, to answer the advertisements, and to study the follow-up material would be a liberal education in mail-order methods.

No mail-order business that I know of selling direct from its advertisements has been successful.

Almost without exception mail-order advertising aims to locate possible buyers. Whether or not a mail-order business will pay depends upon the contents of the catalogues, printed literature, and sales letters sent out. Many of the money-making mail-order businesses of the past twenty years have been based on plausible but insincere appeals. But the government took a hand and put most of these fakes out of business.

Mail-order houses which make good on their promises merit the confidence their customers have in them. Their catalogues are informative, models of logical and emotional appeal, and could profitably be studied by every merchant and clerk who handles similar lines. Houses which put out large catalogues reckon each page as worth several thousand of dollars in sales power; and each department is charged with the cost of the space it occupies in the catalogues. Therefore a high premium is placed upon ability to write accurate, informative, sales-compelling descriptions of the items illustrated therein.

Sales Producing Matter of High Quality Used by Mail-order Houses

Catalogues are not sent out indiscriminately. The utmost care is taken to prepare the mind of the recipient for the catalogue and to invest it with value in his or her eyes. Customers who have not ordered for some time are cut off the mailing-list.

Each letter or inquiry is completely and cheerfully

answered; each complaint is given courteous and careful attention. The confidence of the buyer is stimulated and courted in every possible way, even to sending goods out on approval. This is not really the risk it appears, because the postal laws of the United States are very strictly enforced. Our Government deals promptly with the man who buys merchandise by mail and does not pay for it. Express companies allow buyers to inspect goods sent out by a mail-order house on approval, to be returned to them if unsatisfactory.

Creating Confidence —the Constant Aim of the Mail-order House

It is interesting to note (as proof that the mail-order business does not encroach upon the territory supplied by the ordinary channels of trade) that large retail stores in big cities have found it impossible to build successful mail-order departments with the talent which is useful and valuable in serving the consumer over the counter.

There is something fascinating about being able to write a piece of copy that will produce direct mail-order replies within a certain cost. The preparation of mail-order literature, the answering of letters, and the handling of the goods themselves must be delegated to persons who realize that they must more than offset the prestige-producing and confidence-building effect of a well-located store, attractive counter and window displays, and capable salesmen. The copy writer must understand the value

Mail-order Copy Must More than Offset the Prestige, Displays, and Personal Salesmanship of the Store

of these factors, and replace them in the printed words in the catalogues and in the letters which he writes.

The building of an advertisement which shall attract new customers for a mail-order house is as severe a test as a copy writer can be put to. Unless he gets enough direct responses from the right class of people to make the merchandising effort as a whole profitable, his work is wasted. He must know how to tell an interesting and plausible story; he must also have the faculty of putting into that story an appeal to the buying impulse which will bring a response large enough to prove constantly that his work is being well done. He must keep in mind all the follow-up material which is to be used upon these inquiries, so that he will not attract the merely curious; for confidence, once won, must not be trifled with.

Every Word Must Be Carefully Weighed in Writing a Mail-order Advertisement

The trained writer of mail-order advertisements knows that a single word may effect seriously the number of inquiries received. The headline, "Increase Your Salary," brought twice as many inquiries, in the same publication, as "Increase Your Income," the rest of the advertisement being exactly the same.

A considerable portion of the want columns of daily newspapers and also of the advertising space of mail-order papers is devoted to "Agents Wanted" advertisements. The consumer unquestionably pays more for the article that is peddled from house to

house than for equivalent values to be had of any reputable retailer.

It is safe to assume, however, that as long as human nature is as it is, the satisfaction of having one's trade sought after and the pleasure of listening to a forceful sales talk will make it profitable to peddle sewing machines, subscription books, enlarged portraits, and many household articles. Almost all such agents are secured by mail.

The Change of One Word Made a Wonderful Advertisement of a Mediocre One

Manufacturers whose product is to be sold by canvassers put out ingenious advertising and follow-up matter. The word "Rider," in front of the stereotyped but none the less dependable words "Agents Wanted," brought the Mead Cycle Company 630 answers from a single insertion of an inch advertisement in the *Youth's Companion*. Something about the headline, "Rider Agents Wanted," gave the old story a new significance, and many people wrote in who decided, when the agency plan was explained to them, to buy the bicycle but not to canvass for sales.

Good Mail-order Copy Should Be Repeated

Six pieces of copy, with different headlines, but all telling the same story, published on different pages of the same publication, brought answers costing from 8 cents to $1.54 per inquiry. A good piece of mail-order copy can carry an expenditure of from $50,000 to $200,000 before it wears out. A business which sells a course of instruction pays as high as $1.00 per inquiry, and makes good money on each of seven follow-

up letters which are sent out within the next eighteen months.

I have indicated that the best foundation for a mail-order business is the list of names resulting from dragnet advertisements in mediums of general circulation.

Getting the Names of Possible Buyers

Businesses have also been built up by circularizing lists of names. Several houses make a specialty of listing dealers according to sections, ratings, and the kind of merchandise handled, and guarantee the names to be live and that the addresses are correct. There is also a business in selling names that are taken from answers to mail-order advertisements. At clipping bureaus one can buy lists of the names of persons who are accustomed to travel, those who are reported ill of certain diseases, those who contemplate building, and other information which is gathered from the newspapers.

Seldom are mail-order advertisements used for any other purpose than to get new names of possible customers. Some houses have used large space in order to get a certain prestige. But in mail-order work the custom is to use no more space than is necessary to locate a possible buyer. Prestige-building and confidence-developing work must be done by the catalogue and follow-up literature.

Mail-order Advertising to Focus Attention on the Catalogue

For many years a certain large seed house that sends out more than 500,000 catalogues during December and January has used large space

in big circulations in March, apparently to get new inquiries for the catalogues. But in reality it is to centre attention upon the catalogues already placed in these 500,000 homes, and to stimulate immediate purchases therefrom.

Much of the "Agents Wanted" misleading mail-order advertising has been barred out by the better class of national publications. It will be refused by large daily newspapers as soon as their publishers realize that the confidence of the reader is an asset which should not be trifled with by advertisers who do not make good in every way.

Many men who have been successful in planning and writing mail-order copy have found a larger and more profitable market for their ability in connection with the established channels of trade.

For many lines of business, then, mail-order methods of acquiring and selling the customer are most economical, and for the introduction of a product often afford a quicker, more satisfactory, and more profitable national distribution than could be secured in any other way.

REFERENCES ON CHAPTER XIV

A live and readable monthly, *The Mail Order Journal* (Chicago), contains all the news about mail-order advertising and much valuable information about general advertising.

In 1900 the Sawyer Publishing Company, Waterville, Me., issued an interesting book, "Secrets of the

Mail Order Trade." Though much of its data is now obsolete, it is well worth reading as an historical document.

A complete series of the catalogues of any big mail-order house shows up very vividly the development of mail-order methods and ideas.

To answer the advertisements and read the follow-up literature sent out by a successful mail-order house is one way of making sure that one's information is up to date.

CHAPTER XV

NATIONAL ADVERTISING AND EXCLUSIVE DEALERS

ONE of the fallacies which an advertising man must combat constantly is the statement that if a little advertising is good, more of it should be a great deal better. Advertising is like food—it should be taken, not as an end in itself, but as a means to an end. Three meals a day three hundred and sixty-five days in the year is more economical and more valuable than alternate fasting and feasting. Too little starves and weakens; too much is a burden and does not allow the organization to function properly.

In the preceding chapter I indicated that advertising will *start* a business. It will also maintain a business. The weakness or strength of mail-order advertising is at once evident in the business itself, for advertising is its very foundation. We see quite a different use of advertising when we consider the manufacturer selling to the exclusive dealer. Here advertising is the factor which amalgamates the work of two distinct and strongly entrenched forms of business. On the one hand is the retail merchant who values his personal reputation and standing in the

community in which he lives; on the other the manufacturer who is proud of the quality of the merchandise he makes and appreciates keenly his responsibility to the consumer.

An Arrangement Between Manufacturer and Retailer for the Benefit of Both

The manufacturer does not care to have the identity of his goods lost in the average jobber's stock; the retailer does not want to put his creative ability back of merchandise which can be supplied to his trade territory by any of his competitors.

The manufacturer approaches the merchant and explains that he wants the same high quality of service in placing his goods in the consumer's hands that he himself puts into their design and making. He knows that the retailer can take care of certain elements of a complete service to the consumer better and more economically than he can. He must convince the retailer that he can maintain a high quality and make it possible for him (the retailer) to serve his community with *the best* at the least cost to the consumer.

The Manufacturers Must Contribute All Possible Selling Help—the Retailers Actively Push the Sale

Coöperation of such sort cannot be effected unless the manufacturer brings to the merchant all the selling helps which are produced in a national way most economically, and unless the retailer puts forth the best effort of which he and his organization are capable and takes advantage of the national selling helps that are given him.

The manufacturer can afford space in national

mediums which, as they circulate in the retailer's territory, are the most valuable form of local advertising. The manufacturer's national advertising doubles the value of the dealer's local publicity when the dealer mentions in his local newspapers the nationally advertised lines he carries exclusively.

It is evident that a manufacturer can employ expert illustrators and the best copy writers, and supply the dealer with a complete retail advertising service, plates or matrices ready for use in local newspapers, at a cost which would be prohibitive to the dealer. Booklets, window displays, and sales ideas are furnished him at the minimum expense. The local dealer can draw upon the manufacturer for the best advertising and merchandising talent.

Manufacturers That Fail to Give Proper Selling Assistance to Retailers

Unfortunately the exclusive dealer plan has been abused. Therefore many retailers hesitate to back an exclusive line with their own prestige and hard work. They are right in this stand, for some manufacturers have used national advertising as a bluff, pure and simple, to load dealers with their goods, and then fail to give them the right kind of advertising help. This condition is particularly to be regretted, because it takes so little money to cover the United States in national mediums and so much can be done if the manufacturer acts in good faith and advertises to arouse the interest of the consumer.

There are a number of national appropriations aggregating less than $100,000 a year which include

the use of national mediums and collateral advertising helps for the dealer.

Local Advertising by Dealers to Connect Up with National Advertising

This is only one dollar per thousand population, but it makes a wonderful showing in carefully selected publications of general circulation. Dealers whose trade territory comprises 25,000 people find it profitable to spend from $25 to $50 annually on local newspapers, to connect up with this national advertising as it is the most influential kind of *local advertising* in their trade territory.

If the national advertiser furnishes definite sale suggestions, the dealer will often spend more. As most dealers are committed to a certain amount of local advertising in any case, and since the exclusive sale of a high-class product is a trade-builder and is as profitable as anything they handle, it can be said truthfully that local advertising which coöperates with national advertising more than doubles its own value.

Drawing Inquiries Through National Advertising to Refer to Local Dealers

It is possible (it is being done every day) for national manufacturers to word advertisements in mediums of general circulation so that they will bring direct mail replies. These letters are the dealer's best weapon of defence against mail-order competition. They also locate people who may be trading with his competitors, and give him an excuse for paying them particular attention, so that he can get them into his store and demonstrate the superiority of his service as a whole.

Luckily there are scattered throughout the United States dealers who are as good judges of national advertising campaigns as they are of merchandise. And the manufacturer who makes superior goods and supplements this work with a national advertising campaign which reflects the sincerity and honesty that goes into his merchandise will get the coöperation of intelligent dealers the minute his salesmen show them his national and local advertising plans.

Selling to One Dealer Appeals Particularly to Manufacturers of High-grade Merchandise

Selling goods to one dealer in a community appeals particularly to the manufacturer of high-grade merchandise. There are 559,000 families in the United States having incomes of $6,000 a year or more. Their trade is worth while. The progressive dealer makes a bid for it by having the exclusive sale of high-grade, nationally advertised goods which give him prestige and hold the trade of the wealthier families whose community pride makes them buy goods at home if the local dealer can give them the best quality.

The exclusive dealer plan has been tried out by manufacturers of automobiles, pianos, fine silverware, paints, furniture, kitchen cabinets, stoves, candies, and shoes. Even in a small town one can pick out, by noting window displays and the contents of the shelves, the dealer who caters to the high-class magazine reading group of the community.

The better magazines now refuse to carry the advertising of a manufacturer who seeks the coöpera-

tion of local dealers, unless his national campaign is adequate and accurate, safe and conservative. This censorship is winning the confidence of better class dealers throughout the country, and gives manufacturers who have not yet taken up national advertising assurance of success when they do.

How the Magazines Are Protecting the Dealer by Censoring the Advertising of the Manufacturer

The only basis for successful exclusive dealer distribution is coöperation between a high-class manufacturer and a high-class retailer, each doing to the best of his ability that which he is best fitted to perform.

Advertising, which is the cementing factor of this relationship, often gets results much greater than the financial outlay would seem to warrant. It appears to develop power in the same way a lever does. It brings out the latent force of both manufacturer and retailer as nothing else can.

Certainly the retailer who has a choice between a fine line of goods from a manufacturer who does no general advertising and one equally good backed by a broad and skilfully executed plan of general advertising will not hesitate. But the man who makes a superior product and supplements his service to the consumer by national advertising and sales-building coöperation with dealers cannot afford to identify himself with a second-rate dealer, or to give the sale of his line to one who will not coöperate with him earnestly, vigorously, and honestly.

The Advertising Manufacturer Gets the Preference with Live Dealers

It is noteworthy that people who read general magazines and do not find the goods advertised at any local dealer's are inclined to consider it a reflection upon the dealer rather than upon the manufacturer.

Failure to Handle Advertised Goods a Reflection on the Dealer

Producers who advertise nationally should remain unrepresented in a community rather than allow an incompetent or unsympathetic local representative to weaken their prestige and lower the standard of service which they have established.

A coöperative arrangement is impossible if either manufacturer or retailer is doing business on a price basis. Unless service to the consumer, which is nothing less than permanent satisfaction, is the goal of both manufacturer and dealer, this form of merchandising must fail.

It is not altogether necessary that the manufacturer use national mediums. For certain territories he may use publications which cover them in a broad general way. For several years a certain manufacturer selling almost exclusively to dealers located within the State of Iowa has used three agricultural papers which cover Iowa. Daily papers published at wholesale markets are as competent as national magazines to reach influential consumers and get the coöperation of local dealers within the territory which they cover.

Advertising in Restricted Territories

There are manufacturers who do no general advertising, but furnish the dealer with electrotypes, booklets, mailing cards, form letters, posters, hangers, win-

dow displays, motion-picture slides, premiums, and novelties. A tailor-to-the-trade establishment which had built up a large business in this way spent about $100,000 for devices of this kind and put on a campaign in five national magazines, including a double-spread in the *Saturday Evening Post*, without increasing their total annual advertising expenditure. Mailing cards and form letters were largely replaced by national magazine publicity because it sells both consumer and dealer. The net result was more consumer effect for the same money than they had ever had, and therefore more dealer coöperation.

Advertising Service Furnished Dealers Includes a Variety of Different Kinds

REFERENCES ON CHAPTER XV

The campaigns of national advertisers who distribute through exclusive dealers are the best material for the student. Manufacturers who use this method of distribution and dealers who coöperate with them will undoubtedly furnish information in detail to all who are entitled to it.

Each campaign is individual and distinct, and has solved its various problems in its own way.

To copy the campaign of another would defeat your purpose.

The creators of new ideas and new ways of dressing up the old story make very good money.

CHAPTER XVI

TRADEMARKS

WE WANT to consider, first, what the trademark is worth to the consumer.

I can think of no real reason why the consumer should prefer goods which do not bear a trademark. He sometimes has a notion that they cost less than goods of equal merit which are sold under a trademark. But that wrong notion has been bred by a certain wasteful kind of advertising effort which aimed to develop a bargain-seeking class of buyers.

Merchandise without a trademark lacks backing. People who buy cheap things, or because they are so-called bargains, are surely wasting their substance. The purchaser of a bargain assumes all responsibility as to the quality of the merchandise. So many of us are willing to do this because we do not realize how little our judgment of value is worth.

What Is Our Amateur Judgment Worth

Most of us are qualified to judge of the value of only the few lines of merchandise with which we have had much experience. The highest salaried men in large mercantile establishments are the buyers, but not until they have had years of selling experience are they entrusted with the responsibility of selecting from the

mass of mixed qualities that which is worthy. Much of the talk about the high cost of living is fathered by the flimsy, useless bargain which pleases for the moment but does not contribute at all to the comfort and satisfaction of the home. But the present-day consumer is beginning to demand utility in merchandise.

Coöperation Between Manufacturer and Dealer a Benefit to Consumer

Some retailers who will not handle goods bearing the manufacturer's trademark are sincere in this stand. They feel the responsibility of giving to the merchandise they sell the authority of their own endorsement. This seems to me one of the most encouraging features of modern business. It means that when the best retailers and the best manufacturers are both animated by a high sense of responsibility to the consumer, a degree of intimate coöperation will be possible which the merchandising world has not yet known. And the consumer will benefit thereby.

It has not yet occurred to most of us that a trademark adds to the value of merchandise in our eyes. Persons who have declared that such was not the case have in the next breath admitted that the piano which they own would not be so valuable, even if they knew it to be the very same instrument, were the gold leaf which reproduces the trademark removed therefrom.

The trademark fixes responsibility. The manufacturer knows he must make good on the standard

which he has established for his product, and the consumer actually enjoys more and derives a greater satisfaction from an article the fine points of which he has been educated to appreciate, an article from which he has been taught to extract the largest amount of usefulness.

Trademarked goods, intelligently advertised, yield the manufacturer a larger return for his labor, and cost the consumer less money.

Greater Profit to Producer, Lower Cost to Consumer

The maker of a competitive line of merchandise must base his selling price on the cost of manufacture and distribution. This price is unstable. Its fluctuations depend upon the aggressiveness or lack of intelligence of his competitors. Under such circumstances, he cannot institute or maintain the economies which are possible when he can count on a stable price, no matter what his competitors may or may not do.

Given a profit of 25 per cent. on the selling price, grocers are glad to push goods sold under a well-advertised trademark. On unadvertised lines they demand from $33\frac{1}{3}$ to 100 per cent. The difference represents the cost of advertising to the manufacturer and leaves him an additional profit besides. Yet the article costs the consumer no more. Why? Because of the elimination of waste in gathering the raw materials, in the processes of manufacture, and in the distribution of the finished product.

The advantages to the manufacturer of putting a trademark on his goods are so obvious that I can

think of no reason for his failing to do so except that he wishes to escape responsibility for them. By putting them out under a trade name he recognizes the principle that his own individuality is the basis upon which he must build the largest possible influence with his fellowmen.

Advertising a trademark and marketing goods under it give them stability. Stability means economy.

The Trademark Means Stability

It is not a physical or material quality, but a state of mind which is the result of satisfaction.

I have said that the trademark on merchandise invests it with added value in the purchaser's mind; because we associate trademarks with the creation and maintenance of quality standards.

But the worth of the trademark to the manufacturer lies in the fact that it serves as an anchor for all creative sales work which he has put out in behalf of that product. A trademark is the tangible thing that enables the manufacturer to tie to each piece of merchandise that he makes or handles the prestige and confidence which his ability and integrity have won for him in the buyer's mind.

Mr. Edward S. Rogers, a prominent trademark lawyer of Chicago, states that the right to a trademark

Do Not Hide Your Trademark Under a Bushel

does not depend upon invention, discovery, or registration; but upon priority of adoption and use upon goods, and upon *continuous occupation of the market* with goods bearing this mark.

This statement is interesting in that it implies an obligation on the part of the owner of a trademark to be aggressive in salesmanship, to dominate the market. He dare not assume that his trademark once established he can rest on his oars. If he pushes his product constantly, he may be able, later on, to reduce the price to the consumer. The resultant increase in volume would at least maintain the same net returns, if it did not actually increase his profits. The Ford Motor Company is a notable instance.

Backing Up the Trademark with Advertising

The manufacturer who does not advertise cannot take business from the one who does. He may get some business, temporarily, by price-cutting to distributors who will, for a larger margin, attempt to deliver to him business that has been created by the producer who advertises. But manufacturers and dealers who do this can never succeed, save in the sense that piracy and highway robbery succeed. When business reaches a state where one man can acquire the property of another without adequate compensation, and keep it, commerce will have sunk to a low level. Fortunately proof is abundant that the merchant or manufacturer who possesses a franchise in the form of the good-will of the general public is stronger than any of the powers of pillage or thievery.

Dealers and consumers have been educated to believe that a lower price is a confession of inferiority, and that the cost of the trademark (apparently paid by the consumer) is so little that its elimination by

the non-advertising manufacturer gives him no practical advantage in the market. The consumer is not benefited by the extra sales cost or the inferior quality of unadvertised lines.

The Stronger the Competition, the Greater the Benefit to the Trade-marked Product

If, however, a man takes up a line of business which has been established by a manufacturer using a trademark, and competes with him intelligently, by advertising and straightforward sales work, the competition is a distinct benefit to the original manufacturer, the dealer, and the consumer.

The manufacturer who lets his competitors make his prices loses his sense of responsibility to his customers, and puts a premium on mediocrity, slovenliness, and carelessness.

The Legal Aspect

Legally the trademark must indicate with certainty the commercial origin of the article to which it is affixed. The device or symbol has no value apart from the business itself. The courts have ruled that a trademark cannot be separated, for a price, from the business of which it is the visible sign.

It is not necessary to register a trademark, but it is always advisable.

In many foreign countries registration of the trade name gives the right of ownership to the one making the first registry. In the United States it is merely presumptive evidence. Title to the business and the right to use the trademark depend entirely upon priority of use.

The law of unfair competition has been the most valuable protection that users of trade names have had. It says that no one has the right to represent his goods to be the goods of another.

The best trademark is an arbitrary or coined word which has no descriptive quality in connection with the goods to be sold thereunder. It should be of such character that it can mean one thing and nothing else, both legally and practically. It is quite easy to invent a word which is easily pronounced but does not appear in the dictionary with a meaning which belongs altogether to the goods on which it is placed. It is wiser not to advertise anything like "Michigan" celery, or "Minnesota" flour, as these are generic, descriptive terms and could be adopted by any one who wants to enter the same field.

Before deciding upon a trademark it is best to get expert legal assistance. There are many names in which no exclusive right can be secured because they are descriptive, or are otherwise legally objectionable, or cannot be protected because they have been preempted.

Several large advertising campaigns have been held up, after they have been launched, because it was discovered that some obscure manufacturer doing a small local business had prior right to the use of the name which had been selected for a trademark.

One of the most valuable elements of the service of a national advertising organization is its ability to devise effective trademarks. Years of experience

with trademarks have taught them where the shoals are which threaten the manufacturer who contemplates adopting a trade name and marketing his wares under it.

REFERENCES ON CHAPTER XVI

For additional reading on trademarks, I refer the student to the following treatises:

"Sebastian on Trade Marks," "Paul on Trade Marks," "Hopkins on Trade Marks," and "Nins' Unfair Business Competition."

"Good Will, Trade Marks, and Unfair Trading," by Edward S. Rogers (A. W. Shaw Company, 1914, Chicago), is a most interesting and exhaustive presentation of the whole subject.

"Trademarks and Their Advertising," 1913, by Charles G. Phillips, president of the *Dry Goods Economist*, 231 West Thirty-ninth Street, New York City, is a two-thousand word monograph crystallizing the experience and convictions of one of our foremost trade-paper publishers. Mr. Phillips will send a copy to any reader of this book who requests it.

CHAPTER XVII

PRESTIGE-BUILDING ADVERTISING

EXPERT salesmen agree that their work must be authoritative, i. e., it must lead the buyer to accept *their* judgment as to what he had better buy, instead of following his own bent. A capable salesman knows more about the goods he sells than any buyer can possibly know. Of course he must also be able to produce in the buyer that mental attitude which will afford him the greatest possible utility and satisfaction in his purchase.

The Salesman's Part in Establishing Prestige

I have said before that the salesman who wishes to establish his position as an authority on his particular line must not let his aim be too apparent, lest the buyer resent it. His prestige must be an outgrowth of the buyer's satisfaction with the goods which he is accustomed to purchase on his recommendations. The most satisfactory customers are those who *think they buy*, not those who know they have been sold.

Prestige is that quality which causes others to accept one's statements without question. It is the crystallization of earnest, faithful work on the part of

the producer of the goods in realizing the best quality for a given purpose and then impressing upon the mind of the purchaser all the possibilities of usefulness which the merchandise will possess for him when it passes into his hands.

Prestige —the Impression of Quality Without Question

Advertising builds prestige for the manufacturer and good-will for all his products. Prestige is not inherent in an article, but is what people say about it, and to whom they say it.

The prestige of the political leader is gained by confidently affirming and by continually emphasizing to the group which looks to him as its leader that he possesses certain qualities. He may have them in common with many other persons, but the group does not realize that, because he is advertised, and the others are not.

Constant Reiteration Gains Prestige

Politicians know very well that what is said about them and the manner of saying it measurably affect the amount of influence they have with their camp followers. Both praise and condemnation may add to prestige; but no man can be laughed at and hold a loyal following.

We are respected as much for the enemies we make as for our friends. No one who needs the support of the public dare neglect the manner in which the story of his achievements, his movements, his opinions, and his ideas on certain subjects is to be told to those whose approbation he would win.

Prestige Depends as Much on the Manner as on the Matter of Your Story

In many instances public service corporations

that are giving real service are unpopular because their officials have overlooked the fact that prestige can be gained by telling a story scientifically, i. e., an interesting and informative story which will, at the same time, create that apparently intangible but none the less real factor which is called "favorable public opinion."

The Price of Silence

So often we have misunderstood the motives of public men who were discharging their duties faithfully. We have regarded their refusal to talk about their work as proof that they were dishonest. Such a situation has usually been due to their misconception of what is true publicity.

Many who were severely criticised while they lived have a high place in history, because the publicity given them by the historian has accomplished *after* death what a well-trained advertising man could have done when it would have been worth while.

A Pointed Instance

Those who knew intimately and came into personal contact with Mr. Taft while he was President of the United States were sure of his sincerity and his keen appreciation of his responsibilities.

Mr. Taft is not our President now because he did not understand that it is not so much what one does as it is *what is said about what one does* that adds to or takes from prestige.

Some day some writer of history will find, perhaps in Mr. Taft's personal correspondence, or in the private papers of men who were close to him, proof

that he possessed qualities that would have gained abundant prestige for him during his term of office had we all been told about them in a simple, straightforward, understandable way. Such a prestige might have been produced, I believe, that Mr. Roosevelt would not have risked opposing him.

By neglecting to control the manner in which the story of his work was told, Mr. Taft deprived himself of the prestige to which his work judged alone gave him clear title.

Old Masters Made New —by the Master Hand of Publicity

Much of the present-day prestige of the distinguished men of the past they owe to the men who recounted the tale of their deeds. Many of the master artists of all time have lived and died poverty-stricken, because no contemporaneous historian interpreted their work so that their fellowmen could understand and appreciate it. Nor would most of us value these masterpieces to-day did not art dealers and collectors, by one means or another, constantly keep up our interest in them and direct our attention to points of excellence which must otherwise have escaped us altogether.

The Prestige-building Story and the Telling of It.

The man who is to profit by whatever prestige may legitimately attach to his achievements needs some one to tell his story for him. Unless indeed he chance to be one of those few fortunate men who are able both to do and to get the rest of us to appreciate what they do.

It might be remarked in passing that the man or

woman who knows how to teach the many to value his or her talent often gets a larger share of honor and glory than the public thinks is due. It is just at this point that most of us fail to reason accurately.

Publicity Without Prestige

Doctor Cook had ample publicity; but it won no prestige for him, because he gave us something which fell far short of what his publicity had led us to expect of him. Each year new names and faces appear above the horizon which separates the "unheard of" from those who have "arrived"—and disappear; because they could not "make good" on their publicity, or sustain the prestige which it would have created for them. There can be no permanent prestige unless the story fits the facts.

Masters of Prestige-building

Many will contend that there are more far-seeing statesmen than Theodore Roosevelt, that there are actresses whose work is truer than Sarah Bernhardt's has been, that Mary Garden cannot sing; but the fact is that large groups of people *believe* in each of them, and evidence that belief by continuing to give them their support. That is proof absolute that they "make good" on their publicity.

It is only when the publicity has overstated or has been more liberally interpreted than it should have been that a sense of disappointment has resulted in connection with any one of those geniuses who possess so bountifully the knack of telling the story of what they do in just the way which insures them maximum public appreciation.

The reflex of using a trademark is to create a sense of responsibility which forces the manufacturer to maintain a high quality standard. The same thing is true of publicity. The manufacturer who advertises that his goods will represent a certain well-defined standard has practically discounted his note of hand with the public. He *has* to make good.

The Penalty—"Make Good"

Sometimes a manufacturer takes up general advertising because he thinks he will make more money that way, and for that reason only. As soon as he realizes that the advertising has committed him to maintaining a certain standard with the public, he bestirs himself to improve his inside organization. Better merchandise is the result. The consumer gets the benefit.

Advertising Makes the Goods Live Up to the Prestige Gained

Other manufacturers have decided, after investigating the power of general publicity, to improve the quality of their merchandise before undertaking a general campaign.

I know a man who considered the pros and cons a long while before he made up his mind to advertise. He knew that if he started it, he would have to keep up the quality, no matter what the raw materials cost. And he was afraid he might not be able to increase the price to cover such a rise. That man is a national advertiser now. He found out that the confidence of the public (which advertising gets for him) is the best means of adjusting prices to the market conditions of raw materials.

Some years ago another manufacturer had to face a decided rise in the price of his raw material. His salesmen gave him to understand they could not sell goods at the price necessary to cover this advance if the quality was not to be changed. He was tempted to use an inferior raw material, or to cancel his advertising for the year.

Where a Rise in Price Built Prestige

Instead, he went to the consumer and the dealer and explained that in order to keep up his quality he was obliged to increase the price. By inference he created the impression that competitors who did not do likewise must be using a poorer quality of raw material. This publicity strengthened the bonds of confidence between his brand and dealers and consumers; he increased his advertising appropriation, and the net result was the best year he ever had.

In planning a campaign, the advertiser should remember that it can build for him, if he cooperates with it, a prestige which will give him the balance of power when buyers hesitate, because everything else is equal.

Advertising Brings the Deciding Vote

Certainly an advertiser who shows by his manner of conducting his business that he values the quality of its prestige, more readily gets the cooperation of publishers who believe that admission to their columns bestows upon the advertiser the prestige which the publication has with its readers.

An advertiser who wins *first* the confidence and

support of the leaders of the group to which he wishes to sell is wise. He is realizing on *their* prestige, which, it will readily be admitted, is a force quite separate from the inherent value of the merchandise he offers or the salesmanship he uses in presenting it.

Building Prestige on Prestige

Advertising mediums confer prestige upon the advertiser who uses them in exact proportion to the reader's confidence in the advertisement pages as a whole.

The advertising of one firm has more prestige than that of another for exactly the same reason.

Prestige rests upon confidence, and confidence is publicity, the foundation of which is satisfaction. The creation of prestige should be the aim of every advertiser. It means conservation of power and elimination of waste.

There is a certain kind of salesmanship which finds a market among those who positively enjoy possessing things which their less fortunate neighbors have not the means to buy. Dealers in antiques, small exclusive shops that are supposed to be patronized only by the socially elect, freak restaurants and summer and winter resorts often get business by an appeal to snobbishness.

Prestige Is Substantial —Not Built upon Snobbishness

This might be mistaken for prestige-building. It is not. Fashions, fads, and fancies come and go constantly. The man who elects to make a living by catering to them leads a precarious existence.

Of course there are many people who need not consider the cost of gratifying a desire. They are willing to pay for the pleasure of dealing with persons of refinement and culture. They are willing to pay for *knowing* they are not going to be thrown in contact with objectionable persons. They are willing to pay for their confidence in the merchandise they buy, although they may not be conscious that they are paying so much for merchandise and so much for confidence.

The Price of Confidence

The practice of institutions which have been established by the use of prestige-building salesmanship and advertising is to reduce their prices to a point where no customer need pay more than he would elsewhere for the same service. Then the prestige of the business, which undoubtedly is an element of the purchaser's satisfaction, is service plus.

No business is safe which charges more, simply because its customers will pay more. Prestige is business life insurance.

A House of Cards

The patrons of certain dealers in musical instruments, jewelry, and art objects, and of certain tailoring and dressmaking establishments insist they get full value for every dollar they spend, quite apart from the question of the prestige of the house from which they are buying. Competitors have their groups of customers who are equally sure that they get full value *in the merchandise* of stores which sell lower-priced lines.

When does a customer pay for prestige and when

does he get it as an additional satisfaction? It is the old story, "How can you tell the difference between a mushroom and a toadstool?"

A business is decidedly in danger when customers who have unlimited means leave it for competitors whose prices are lower.

A waiting-list would seem to be the only positive insurance which a business that depends altogether upon prestige may have.

As Omar Says: "A Hair Perhaps Divides the False and True"

The dividing line between the house which charges for prestige and the house which gives full value in service cannot be determined by consulting the customers of either or both houses, for there will be radical differences of opinion.

When a lawyer has more possible clients than he can take care of, when a physician's reception-room is crowded with people waiting their turn, when motor cars have to be ordered several months in advance, it may be assumed that the high price is justified by the service.

But that business is doomed whose customers, having ample means to pay the highest prices, go elsewhere believing they are getting the same value for less money. And the management usually wakes up too late to reëstablish the business on a sound service basis.

REFERENCES ON CHAPTER XVII

Lord Rosebery's "Napoleon, the Last Phase," 1900 (Harper & Brothers, New York), detailing Napoleon's life after he reached St. Helena.

"The Greatness and Decline of Rome," 1907–1909 (W. Heinemann, London), by Guglielmo Ferrero.

William Hickling Prescott's "The Conquest of Mexico," 1909 (E. P. Dutton & Company, New York).

These books are as fascinating as modern fiction: they tell of men who believed in and attempted to create prestige for themselves. They trace clearly the effect of ideas dominating the group consciousness in the history of nations. They show how real leaders of men have always striven to sway the minds and especially the emotions of the people whose confidence gave them their power. They show clearly the difficulty of the historian in separating fiction and fact, because leaders of people have always been more concerned as to how the story of what they were doing was told the people than in the story itself.

CHAPTER XVIII

COÖPERATION BETWEEN SALESMEN AND ADVERTISING—SALESMAN, THE CLOSER—ADVERTISING, THE MISSIONARY

ADVERTISING becomes a significant element of salesmanship when the salesman perceives its power to implant the buying impulse in the minds of prospective customers. Then he can devote to closing sales the time and energy he had been putting into stimulating them. A worth-while salesman's time is valuable, and should not be frittered away on work that could be done by advertising. A salesman should be a closer, not a missionary.

Advertising serves the salesman by putting the dealer in the most favorable mental attitude before he calls. The dealer soon discovers that advertising serves him, too, by continually creating in his customers the impulse to buy.

Creating the Buying Impulse

It follows that advertising cannot be completely competent unless it has the salesman's confident cooperation.

The most successful salesman uses advertising in selling goods, just as the factory superintendent uses modern machinery in manufacturing goods.

It may seem strange, therefore, that it should ever

be difficult to get a salesman to coöperate with the advertising of the institution which he represents.

Team Work

Salesmen really sell ideas. The sale takes place in the buyer's mind when he lets the salesman's idea supplant his own.

Salesmen are human beings and must themselves *be sold on new ideas* to replace the old ones. So for the past ten years my work has been largely selling to salesmen who were already doing a good business the idea of coöperation with advertising.

First, it is necessary to convince the salesman that by coöperating with the advertising he can so largely increase his sales that his net personal income will be larger, although computed on a smaller percentage of direct return to him on the amount of his sales.

Increased Income for the Salesman

Advertising is right only when it serves the consumer. Personal salesmanship can be permanent only when it survives the same test. No manufacturing institution or retail store can advertise and pay its salesmen the same rate per dollar of actual sales without increasing the burden to the consumer. If the salesman is putting in full time and concentrating on his work, it is comparatively easy to convince him that more competent tools mean larger aggregate sales. He cannot make advertising *count* for him until he understands what it really is, and what are the purposes of the campaign of which his work is a part.

Service to the Consumer —the Stability Test of Both Advertising and Salesmanship

The Salesman with a Medieval Mind

The salesman who scorns the assistance of advertising, if he is to be consistent, should refuse to use the mails, the telegraph, and the telephone. Because the cost of these three agencies, which multiply so many times the possible number of buyers within his territory, must be charged to the selling appropriation.

Reducing the Selling Cost

There are 92,919 commercial travelers in the United States, and 611,139 retail salesmen. Most of these 704,058 men and women are distributing merchandise to the consumer more economically than he could be served by any other means. There are also 317,811 agents and peddlers. It may safely be said that no agent or peddler delivers goods to the consumer at less than double the price he has paid for them. No advertised line that I know of, sold through a local dealer, bears anything like such a selling cost.

Utilizing the Modern Machinery of Selling

The commercial traveler and the retail salesman must decide whether they will be peddlers and do practically all the work of selling, or whether they will be salesmen in the true sense of the word, coöperating with all those forces which mean volume of business and are most economical and serviceable to the consumer.

Advertising and Selling Cost No More than Salesmanship Alone

I have often said that the first manufacturer of a competitive line who advertises can market his product by means of advertising and the best type of salesmanship, pay his salesmen better salaries than his competitors can afford

to pay their men, and keep his total appropriation for *advertising and salesmanship* within the figure which previously had been sufficient for personal salesmanship only.

This statement has been proved to be true for many lines, notably ready-made clothing. The clothing manufacturer did not advertise to the consumer at all twenty years ago. The best houses pay their salesmen 3 to 4 per cent. on their total sales. The advertising appropriation is generally less than this. It would not pay a salesman who handles a well-advertised line at 3 per cent. to exchange it for an unadvertised line at 10 per cent. With advertising, his volume of sales goes up immediately, and the conditions of work are more pleasant.

The Salesman Works on a Bigger Scale

Salesmen for a certain manufacturer which advertises nationally to the consumer but distributes through the local dealer stop at the best hotels wherever they go, carry a packer whose salary and expenses must come out of their sales, and arrange in advance for customers within a radius of eighty miles to call on them on specific days, allotting two hours a day to each customer. They get these customers together in the evening for a conference and general coöperative discussion of trade-building plans in which all are interested. Under the old régime, the salesmen had to pack and unpack their sample trunks, and could not cover nearly so large a territory. Result: their total sales were much less.

A commercial traveler who understands thoroughly that his salary and expenses must come out of the goods he sells will take advantage of every force which will help him get the same result at less cost to the dealer and consequently to the consumer. He *knows* (at least he can know if he investigates) that intelligent advertising does work that he must otherwise perform—and does it at less cost. A retail salesman ought to be glad to push advertised lines, for by so doing he is rendering the consumer the largest amount of service, and making himself more nearly indispensable.

Advertising as Insurance Against the Future

There are to-day a number of large mercantile establishments which must adopt another method of dealing with their salesmen, or—have no chance at all twenty years from now. Unless they soon perceive that scientific advertising saves money, young merchants who do are going to crowd them out.

Let the Wholesale Salesman Coöperate with the Advertising of Branded Staples to Set Higher Standards for the Retailer

There are wholesale grocers who permit their salesmen to quote cut prices on staples, and then measure their value to the house by the amount of merchandise they have sold on which exorbitant profits have been made. This practice fosters a merchandising condition which is just about as bad as it could be. The retail grocer ought to respect the wholesaler's salesman; he ought to realize that this man can be an immense help to him in building a business. The grocer should be sold on coöperation, and taught how to explain to his trade

that his service is *worth* the difference between the cost and the retail price of his wares. The handling of advertised staples by retailers fosters such a relation; but the salesman or jobber who confuses the retailer and destroys his conception of values is a force that pulls in the opposite direction and is demoralizing.

It Is the Salesman's Job to Educate His Trade to Coöperate

The commercial traveler who represents an advertised line and the retail salesman who talks to the consumer across the counter have a chance to study the buyer at close range and to adapt their merchandise to his desires and needs. Of the two the commercial traveler should have the broader outlook. He should be able to talk not only to the merchant but to his clerks, *from their own standpoint*, which is that of the man who purchases goods to sell again. He must also convince them from the standpoint of the consumer.

In Chapter IV I have outlined the advantages to the individual of being a member of various groups. There is also this: that the leaders of the various groups to which you belong, by reason of the obligations of their office, relieve you of various duties, and much planning and organizing.

Just here I want to point out that the man who coöperates is constantly educating within himself the highest type of individuality. We all know the man who, as a youngster, went into a large business house and did willingly and cheerfully everything he was

asked to do; until it became a matter of habit to give him the first opportunity to handle whatever new responsibilities arose as the business grew. This type of man rises to the head of an institution as inevitably as cream comes to the top of milk. His ability to assume and make good on the varied tasks entrusted to him gives him a broad grasp of the business as a whole and develops individual competency and the sense of power which is the product of responsibility.

Responsibility—Coöperation

The word responsible really means "ability to respond," which is about as true a definition of "coöperation" as could be framed. The person who cultivates the ability to respond is constantly exercising those qualities which characterize the best type of manhood. I would qualify this statement only thus far—that such a man must test what he does by this one query: "Does the business I am engaged in and the work I am doing in connection with it give the consumer the best service which he or she can possibly obtain?"

Advertising flourishes where coöperation is understood and practised. A baseball team will have better catchers, more wonderful pitchers, more remarkable basemen and fielders if each member of the team positively desires each one of his fellow players to perform brilliantly, to excel.

The reflex upon the man who practises coöperation makes him a better man; it enlarges his individual

powers. It instils in the minds of his associates the idea of reciprocity, thus assuring him of their support when he needs it. Coöperation reduces the cost of production. By elevating the standard set for all—because that standard constantly embodies the best thought of each individual member of the organization—coöperation improves the quality of the joint product of all the members of that organization.

You Are Bound to Get More Than You Give, No Matter How Much You Give

REFERENCES ON CHAPTER XVIII

The idea which underlies scientific management is intelligent and confident coöperation. Salesmen will enjoy Frederick Winslow Taylor's "Principles of Scientific Management," 1911 (Harper & Brothers, New York City), and Harrington Emerson's "The Twelve Principles of Efficiency," 1912 (the *Engineering Magazine*, New York City).

CHAPTER XIX

PRICE MAINTENANCE

WE CAN best approach a consideration of price maintenance by reviewing the following points:

(1) The one-price system builds business for the retailer. It serves the buyer best, by saving time which he must otherwise spend in bargaining. It conserves the selling energy of the salesmen who must concentrate on demonstrating the specific value to the consumer of the goods offered for sale.

(2) Mail-order business is possible only because prices can be *fixed* and vast editions of catalogues printed and extensively circulated. Consider the confusion, loss of time, and congestion which would be inevitable were any time devoted to writing letters to ask for prices or to haggle over charges!

(3) The exclusive dealer, or the agent of the manufacturer, likes the one-price plan because it insures him a profit. In fact, this price argument is the basis of the abuse of the exclusive dealer idea. Many manufacturers put in time selling the dealer which could be spent more profitably upon the consumer. Many retailers load up with exclusive lines; whereas

a keener appreciation of the value of *service in the distribution of staples* would have been more valuable to the consumer, and, therefore, more profitable to the dealer.

The Field of Tremendous Accomplishment

Producing a staple and advertising and distributing it through every possible channel is the biggest thing a manufacturer can do. It calls for more kinds of ability than any other kind of commercial effort. It is no task for the quitter, the faint-hearted, or the "piker." The results it gets are princely in scope and splendor.

Getting the "Jump"

Given an article of merit and a fair price (which means a margin of profit for all who assist in getting the maximum distribution for it), an adequate national advertising campaign will so entrench one manufacturer's position that a competitor who makes equally worthy merchandise must spend many times as much for advertising in order even to divide the field with him.

Price cutting by retailers must be fought on the theory that the manufacturer who creates and controls the market for his own goods can best serve the consumer.

Retailers who make leaders of advertised goods by cutting the price will eventually substitute to the detriment of both manufacturer and consumer.

Unfortunately, the Supreme Court of the United States has been ruling against the manufacturer who wants to put a fixed reselling price on his merchandise. Some lawyers believe that the fact that a man

can control the use of his name and can prevent others from selling goods which purport to be his will eventually find legal expression in a decision which will give owners of trademarks the right to determine the price the consumer shall pay for goods bearing that trade name. Present rulings proceed upon the assumption that the man who buys and pays for an article owns it absolutely and can give it away or sell it for any price he sees fit to place upon it.

The Supreme Court and the Fixed Price

There are two ways of handling price-cutting on staple, trademarked products which all manufacturers agree are reasonable:

Two Ways of Maintaining Price—Both Effective

(1) *Moral suasion.* I could cite many instances where a salesman has induced a dealer to give up price-cutting on his product. Each dealer promises to quit if the others will. Dealers are in business for the money there is in it. If price-cutting does not bring trade which buys other goods at a profit, the dealer soon throws out the article he has been cutting and substitutes a competitive article. The manufacturer who created and developed the market loses; and the consumer loses.

(2) *By refusing to sell to price-cutters.* It is illegal to *agree not to sell*, but a manufacturer may refuse to sell to a distributor without giving any reason.

Selecting the Salesman Able to Stop Price-cutting

The advantages of price maintenance are so universally conceded and the evils of price-cutting so generally condemned that salesmen should

be selected with direct regard to their ability to put a stop to the latter in the territory which is assigned them.

When dealers are fully conscious of the power of a trade-building advertising campaign to locate new buyers for advertised staples they will not be so prone to cut on them.

A salesman who comes to the dealer with suggestions, plans, and methods for increasing his business by coöperating with the manufacturer's advertising plans (which means new business for both manufacturer and dealer) can easily convince him of the folly of diverting an established demand, for a little time, by price-cutting.

For each buyer who *knows* the value of a piece of merchandise and would be tempted by a cut price there are *twenty prospectives* who have been almost convinced by the advertising and need only the dealer's invitation to buy and assurance of quality to close the sale at a profit.

Cut Price to One May Destroy Confidence of Many

Cutting the price to these prospectives may "queer" the sale altogether by suggesting inferior quality. What little is gained by enlarging the market among those who are already convinced of the value of the article is more than offset by the loss of confidence among those not yet sold and the certain curtailment of distribution by dealers who will put under the counter goods that are sold at cut prices elsewhere, and only supply them upon positive demand.

Retail merchants' associations know what the effects of price-cutting are. Sometimes retail grocers have met department store price-cutting at the instigation of the secretary of their local organization, who keeps them informed of exactly what is being done. The department store has to make a profit, and will stop cutting when there is nothing to be gained by it.

It is commonly believed that the grocery section of a department store is only a bait to get trade into the store. It is noteworthy, in this connection, that to reach the grocery section one must usually pass through other departments where profitable goods are attractively displayed. Many successful retail grocers meet the situation squarely by selling customers on the value of their service, and by convincing them that a reasonable profit on dependable merchandise is just.

Plus Service vs. Cut Price

Some years ago there was considerable talk about the manufacturer advertising to the consumer, thereby creating a consumer demand which would *force the retailer to handle his goods.* In many instances this policy has apparently worked. Wherever such is the case, there exists an opportunity for a competing product of equal merit to supplant the present leader, *if* the manufacturer will work out a scientific plan of advertising to the consumer, sell to the logical distributors, and give each link of the distributive chain a reasonable profit.

To one dealer who can be coerced by advertising which creates a consumer demand there are twenty who can be convinced that in the "almost persuaded" consumer there is a chance for manufacturer and dealer to coöperate and build business for each other.

Persuasion vs. Coercion

The salesman who calls on the dealer can say truthfully that he is not interested in the sales the dealer is forced to make through advertising. His house is bound ultimately to get the business of the consumer who will seek the store that keeps advertised goods and refuse to trade at the store which does not. This salesman can say that he is not sent out to get the business that is the result of advertising demand, but to get new business by showing the dealer how to make sales which have been started and partially developed by advertising.

The dealer who understands the power of advertising will not be a price-cutter. He will be a conservationist, not a pirate; and will push his business on service lines; for service brings him the good-will and fixed buying habits of satisfied customers.

No advertising and selling campaign of national scope can be considered complete or likely permanently to entrench the product advertised as the leading staple of its class unless the price of the article to the consumer has been fixed justly.

Merchandise of universal distribution should be priced low, for two reasons:

(1) Because the patronage of the masses cannot be expected unless they get maximum value for their money.

(2) While cost does not measure the value of goods to people who have money enough to gratify their desires, a low price does enlarge the market of any product by bringing it within the reach of the largest number of people. It also fortifies the manufacturer against future competition. Persistent advertising supplemented by shrewd, competent salesmanship will *hold* a market once preëmpted.

Confidence vs. Price-cutting

Why? Because good advertising is the cheapest salesmanship; because the skilful advertiser can pay the highest salaries for the best salesmen, and still keep his total selling cost under that of his competitors.

Advertising —the Strongest Ally of Price Maintenance

Goods marketed through all channels of distribution use advertising in the largest way, to benefit the consumer, the advertiser, and all intermediaries in the plan of distribution. Goods become staples and the cost of moving them is diminished to the least figure. They actually pay best every one who touches them. They are sold at a low price, to get the widest market; but bear a sufficient margin to pay all those whose services are needed to give them the adequate distribution. This is the ideal condition.

The lower the price to the ultimate consumer, the less trouble the manufacturer will have with price-cutting, the wider will be his market, and the more

likely he will be to establish himself permanently in it. He must remember, though, that the laborer is worthy of his hire, that stable conditions must be fostered, and that price maintenance is the mother and father of stability.

It cannot be out of place to close this chapter with the statement that a manufacturer who trademarks an article of merit and plans a comprehensive merchandising and selling campaign, the objective point of which is the confidence and convenience of the consumer, creates a staple in every sense of the word.

A well-advertised product towers above its competitors in the public mind, though it may be no more deserving. It has achieved distinction and acquired the consumer's preference. Its maker can *count on* a certain known demand. This insures better quality for the consumer. All this because he and she, the consumers, put their trust in the manufacturer's trademark. Price maintenance is the manufacturer's duty to protect the business he has created.

REFERENCES ON CHAPTER XIX

"Price Maintenance," 1912 (the Commerce Publishing Company, Philadelphia), by Thomas A. Fernley, is the most complete exposition of the idea that has reached me. It contains many specific ideas for trade betterment. But the author betrays a peculiar lack of appreciation of the power of advertising to do away with many of the evils for which he suggests other remedies.

In "Concentration and Control," 1912 (the Macmillan Company, New York City), Charles R. Van Hise, president of the University of Wisconsin, discusses at considerable length the debasing effects of price competition as compared with the splendid results which the other two kinds of competition—namely, quality and service competition—get for us.

On price maintenance, see also: "Price-maintenance Encourages Individual Enterprise," *Collier's Weekly*, July 19, 1913, by Louis D. Brandeis; "Cut-throat Prices," *Harper's Weekly*, November 15, 1913, by Louis D. Brandeis; "Competition and Coöperation," *The Fra*, December, 1913, by Dr. Charles P. Steinmetz.

CHAPTER XX

ADVERTISING OPPORTUNITIES

THE word "opportunity" suggests a human being at once. Imagination is the key of opportunity. To man only is it given the power first to project a mental picture of a possibility, and then to transform it into an actuality.

Progress is thought that has found expression in physical labor. Work without thought will always be menial and have to pay a heavy tribute to supervision. Thought which does not find concrete form in creation makes man a mere dreamer.

The line between success and failure is so thin that a man has to keep two thoughts constantly in mind. One is to know what he can do better than other people. The other is to know how to impress people that are in the market for the kind of ability he possesses that he can and will deliver without friction with other people who are selling their services to the same buyers. He must know what he knows and know how to coöperate in rendering service.

First, let me emphasize the fact that there is nothing mysterious or strange about the business activities which are covered by the word "advertising."

Young men who want to study advertising often come to me for advice. A little questioning makes it plain that they think advertising is a marionette show sort of thing, operated in some strange fashion by wires and hands not seen, and speaking a lingo all its own, a magic formula for making money rapidly—something which can be acquired in much the same way that we learn the multiplication table.

Advertising a Serious Business

The big field of advertising is its application to ordinary everyday business. The business of producing, marketing, and using advertising space does require various kinds of talent and experience. But the big opportunity in advertising lies outside what is commonly known as the advertising business—for the next ten years. *The key to success for the young man* whose sole capital is brains and energy is the application of the principles of advertising to ordinary everyday business.

There are several distinct types of advertising men.

1. The publisher or plant-owner is the man who produces advertising space. It happens that he is rarely the best judge of its value to the advertiser; for he is primarily an organizer and executive. The best publisher is the man who knows best how to get and hold subscribers. The men who own street railway advertising and billposting privileges, painted bulletins and wall space, and electric signs, are concerned largely with leases

The Publisher

and with details incident to building and maintaining a plant.

2. The advertising solicitor who represents the publisher and plant-owner must possess marked sales ability. The advertising solicitor of twenty years ago did not at all resemble the man who does this work to-day. Business men no longer need *to be persuaded* to advertise. Advertising is not on trial now. Each advertising medium has won its own place in economical merchandising. Contract-getters are constantly being replaced by men who know the characteristics of the groups of people reached by the mediums they represent, and who can advise how best to use the space they sell. The ideal representative advises *against* the use of his medium when he knows that the advertiser's story is best suited to another. He seeks for customers those whose business can best be advanced by using his medium. He is after permanent business, and that predicates the possession of satisfied, loyal customer groups.

The Advertising Solicitor

3. The advertising writer's work is to find out the salient points of the merchandise he is expected to sell, and its points of contact with the people whose confidence in the medium makes them accessible to him. The mere writing is simple, once the preliminary study has been completed. The illustrator differs from the writer only that he uses pictures instead of words. Both of them know well that in the interpretation of the advertiser's

The Advertising Writer

message to the group which can most be benefited by it lies the highest expression of the art.

4. The buyer of advertising space must be an analyst and a statistician. A goodly measure of experience and common sense added to this, and ability to read human nature, soon put him in the foreground of the advertising field.

The Buyer of Advertising Space

5. Printers, plate-makers, and typesetters advance beyond the limits of trade lines in direct ratio to their ability to comprehend and interpret the advertiser's message.

Printers, Plate-makers, and Typesetters

Broadly speaking, one of the best openings for the young man who wants to take up advertising is with the publisher. Each one of our 22,141 daily, weekly, monthly, and miscellaneous publications has a permanent place for the man who can increase its revenue and eliminate waste in the distribution of the fruits of intelligently directed labor. To do this he has only to insist that the advertising columns of the paper must be as informative and interesting as the news columns.

Big Advertising Opportunity with the Publisher

Many publishers have added to their personal incomes and made their publications more useful to the readers, and therefore more valuable to the advertisers, by writing copy for them.

It would pay each one of the 790,886 retail dealers of America to study advertising, the laws which govern it, and its methods; and then apply them.

The manufacturer who advertises serves the consumer by keeping in touch with him in gathering data for advertising, and by teaching him how to make the best use of what he buys. Every merchant, every salesman behind the counter, every commercial traveler, every sales manager, should know what is right and what is wrong in advertising. Those who neglect so to equip themselves must not complain when they are supplanted by those who have done so.

Advertising Courses in Universities

It is noteworthy that universities are now offering courses in journalism and advertising, and that there are several correspondence courses in advertising that are well worth the time and money they demand. The only warning I should voice with reference to the study of advertising applies with equal force to all theoretical knowledge. A fact is a theory that has been demonstrated.

All learning is valuable in so far as it trains to think and teaches the principles which control the everyday events of life.

The spirit, not the letter, is the thing. To imitate is servile.

Many an advertising failure is the result of following precedent blindly, of applying the letter of the law instead of its intent, the slavish imitation of the mannerisms and style of the successful. It is the frank, spontaneous expression, allowing the style to take care of itself, which has the appeal.

The quiet, unobtrusive service methods of the present-day salesmanship, as contrasted with the

boisterousness and occasional sharp practice of its forerunner of a quarter of a century ago, is paralleled by the differences between the advertising man of that period and the writer of copy, the illustrator, and the solicitor of to-day, who rely upon a simple, straightforward story to the consumer. An expression which diverts his attention from the main issue —the service he is to receive—is wasteful.

The opportunity in advertising is the opportunity which exists in all merchandising and selling—to eliminate waste, and to install and maintain simple, direct methods which conserve the buyer's time by giving him, with the least effort on his part, a complete understanding of the usefulness he is to have in his purchase.

REFERENCES ON CHAPTER XX

"How to Get a Position and How to Keep It," 1908 (Funk & Wagnalls Company, New York), by S. Roland Hall, will help the beginner market his ability.

"The Message to Garcia," by Elbert Hubbard, must always remain a classic in revealing the kind of man who grasps and makes the most of the opportunities that are in every one's path. Mr. Hubbard's brochure, "Get Out or Get in Line," is typical of his sound business philosophy which he expounds every month in the *Fra* and *Philistine* in a style which can be profitably studied by every advertising writer.

CHAPTER XXI

THE ADVERTISING MANAGER

THE average young man who considers the advertising business as an opportunity for his own future usually thinks that the position of advertising manager is the most desirable one.

Many men think of the advertising manager as sitting in his office and receiving calls from men who have all kinds of space to sell, also from photographers, printers, engravers, artists, dealers in novelties. True, there are many men who bear the title of advertising manager but whose duties go no further than acting as a buffer for the man higher up. And to a certain limit this is worthy work. Many of those men have keen discrimination and judgment in knowing which of the many things that come to their attention every day to take up to the sales manager or head of the house. The position of advertising manager is one not strictly defined in its scope nor standardized. Many men having the title have absolute authority; others have the authority only to investigate and make recommendations; still others are no more than clerks to whom detail work is delegated for checking up.

Advertising Manager Should Be Synonymous with Sales Manager

The advertising manager in the full sense of the word should be synonymous with sales manager. He should be the man who interprets the sales policy of the business, both to the personal salesmen and to those who are reached through the medium of printers' ink. The experience that I have had in the advertising business through more than twenty-five years leads me to say that the advertising manager's job is just about as big as the man who occupies it. Mr. H. M. Swetland, president of the Class Journal Publishing Company, once said to me that he couldn't make a bigger trade paper than the editor that he could get to run it. The same is true of the position of advertising manger. The job is as big as the man who fills it.

Instance after instance could be cited of large business institutions where the men who now direct and control their policies started as advertising managers. Many other instances could be given where men as advertising managers secured their first broad insight into business and grasped the possibilities of the market in its relationship to the group of people that sustain and make the market possible better than the men for whom they were working. As a result they advanced to the highest executive positions in other concerns where those in charge were big enough to appreciate creative ability and grasp of selling opportunities.

It may be truthfully said that a young man, in

developing his business career, passes through four distinct epochs. First, in the days when he is earning enough money to pay for his clothes and board and have something besides, without being dependent in any way upon his parents, comes the consciousness that he can support himself. This is a delightful sensation to any young man and is always to be fondly remembered. It is one of the best foundations upon which an executive builds his career, to be able to say that at a certain age he performed a certain duty for a certain sum and he earned what he got without any pull, preference, or any other consideration than the actual value rendered the house upon whose payroll his name appeared.

The Four Epochs in a Business Career

In the second epoch the young man has advanced to such a position of responsibility that he can be entrusted with work without supervision. He realizes that he is trusted and must act upon his own initiative and on his own judgment. In this second epoch a man realizes that honesty, dependability, and the power to accept responsibility bring him cash dividends in addition to the amount of physical and mental labor that he can put into his task. This is the position occupied by many salesmen out on the road. Unfortunately, for themselves and for the houses they represent, they feel that they have reached the limit of development. This thought in their minds is a handicap both to themselves and to the houses which employ their services.

Second Epoch—Working Without Supervision

The third epoch in a successful man's career might be termed the executive epoch. He realizes that if given assistants to whom he could delegate duties for handling under his supervision he could accomplish more for himself and for his house. The man who does reach this stage is on the sure road to advancement, because there is always somebody ahead of him who is doing work that he can well afford to delegate to take up other work that will insure his own advancement.

Delegating to Subordinates Is Epoch Number Three

The institution which makes every man feel that there is work to be done whose execution is worth more money than he is now getting, and in order to handle this higher grade of work he should delegate all possible duties to men getting less than he is, is bound to develop a growing, successful, united, progressive institution.

The fourth epoch is where a man is able to command the coöperation of men more expert than himself. As the head of a department he greatly increases his power by winning the confidence of other heads who are coördinate with him. As the chief executive of any big business, the man who can get the most help from his lawyer, his banker, and all the experts associated with the other houses from whom his house buys and to whom it sells, is worth more than if he is particularly prolific in original ideas himself. True executive ability is getting things done by others most competent to do them.

Commanding Co-operation of Big Men Is Fourth Epoch

The advertising manager should delegate as much work as possible on the theory that by working with experts he will get work done on the most expert and economical basis. His judgment of where and how things should be done is worth more to the house than his skill in personally doing things himself. In this way he is bound to put himself in a position where he can grow with the house.

Good Judgment More Important Than Handling Details

Fortunate, indeed, is the young man who can get the position of advertising manager in a house whose head is dominated by the ambition to be a controlling factor in the market. Such a man is ready and willing to take on more responsibilities himself, and will freely delegate the work he is doing to men who will take it off his hands.

It is often necessary for a young man in a subordinate position to take work away from the executive by main force, but if he is a dominating factor in his market he will like these methods rather than resent them on the part of the advertising manager. Such an advertising manager, fortified with a simple system of accounting by which he can show at all times that he is taking care of the responsibilities entrusted to him, is bound to advance more rapidly in a large business than a man of similar ability occupying any other position that I know of, unless it is the general sales manager himself.

An advertising manager should keep in touch with general literature of all kinds. He should constantly

watch the development of new ideas. He should take his work very seriously, and develop the broadest possible culture, and at the same time keep in close touch with all of the men who have practical experience in details of the business with which he is connected.

It is the same principle that inspires the head of the largest business to use the best banker, the best physician, the best architect, the best engineer, the best lawyer, the best expert in every line; and it is the man who entrenches himself in modern business in this way that makes his position practically impregnable.

The advertising manager in every institution should be the peer of everybody else in it. To fully perform his function he should, as I have said before, supervise the sales. He should be present in every conference where the policy of the house is under discussion. Advertising can be utilized in so many different directions that there is no question coming before any institution in which the effect of advertising should not be carefully considered.

The Business Should Be an Open Book to the Advertising Manager

An advertising manager, to fully grasp his responsibility, should be one who has passed through the three preliminary epochs of experience and is in the fourth epoch. He should be able to merit and hold the confidence, and secure the intelligent coöperation of the head of the business. He should be able to command the confidence and coöperation of the factory

The Strong Advertising Manager Must Be Mature in Development

superintendent, of all the salesmen on the road, whether they report directly to him or to another man who has coördinate authority in the sales with himself. He should be able to employ and secure the best results from his personal contact with expert printers, advertising writers, publishers, and organized advertising institutions that are equipped to give service.

The Ability to Get Co-operation

It has been well said that a bad workman quarrels with his tools, and nothing more clearly demonstrates the mediocrity of the advertising manager than the statement that he cannot get good service from people with whom he comes in contact. The ability in the advertising manager himself to inspire men with whom he does business to do their best is one of his greatest assets, and the quality in him that will make his efforts count for the most.

Knowing Where to Get the Best the Secret of Success

Advertising in itself is too complex, too broad in scope, too infinite in detail for any one man to master it all. The men who accomplish the most in the position of advertising manager are those who know where the best work can be done and how to secure it for the institution with which they are connected. No advertising manager can get all of the assistance that he needs by sitting in his office and waiting for good things to be brought to him.

There are often cases of men who are able to perform valuable service, but have not yet learned how to sell it in a market where it would be most ap-

preciated. No man ought to be more conscious of this than the advertising manager himself, and he should be most alert to leave his office on a search to find out where the best service that he can use can be secured and developed.

Advice to Advertising Manager in a Concern New to Advertising

If a young man were to accept the position of advertising manager in a concern that had never done any advertising, I would advise him to proceed about as follows:

As is usually the case, he would probably be expected to write copy. The best thing for him to do—and he shouldn't undertake the job at all unless able to write plain, sensible, ordinary, everyday, one syllable English—would be to get saturated with the ideas by which the best salesmen of the house produce permanent business. By permanent business, I mean sales to those customers that give evidence of being satisfied with their dealings with the house through repeat orders and constantly increasing volume of business on the basis of annual sales.

Getting Saturated with Information Essential

The advertising manager when saturated with the qualities of service in which his house excels will embody his knowledge into the copy and letters he writes, intensify the hold that the house has on its present group of customers, and intelligently devise ways and means by which the customer group can be enlarged. Then he should select a printer in whose honesty and integrity he has complete confidence. He should not accept

favors of any kind from this printer. If he goes to lunch with him he should make it a rule either to pay for his own lunch or alternate in paying for lunches.

Get a Good Printer

The temptation to accept little favors from people who are selling is very great, but the advertising manager, who places himself on a basis where he cannot be influenced in any way, or who insists in the name of his own house in reciprocity on matters of this kind, has gone a long way toward insuring his own standard and the securing of the best service from those with whom he deals.

The good printer is a man who knows how to manage his own business successfully, who doesn't estimate on a hit or miss basis, who has an organized, systematic scale of prices, and who figures things fairly and honestly. Such a man is more likely to have time to confer with the young advertising manager, and, being a good business man himself, is more likely to discuss selling problems along sound, fundamental business lines.

The Good Printer Defined

Many instances that I know of could be cited where young advertising managers owe much of their development to having given their confidence to self-respecting, successful printers who had a regular scale of charges for their work, and who, therefore, did their business on a sound, economic, but profitable basis.

Everything said of the printer is true of engraver, paper house, and all others who come in to sell

the advertising manager supplies. The advertising manager should never forget for an instant that he is a trustee of interests that have been placed in his hands, and that he owes it to himself to maintain his self-respect by handling every dollar in a manner which will produce the largest possible return for the house who delegates this responsibility to him.

Getting Competent Assistance from Sellers of Supplies

Many young men do not seem to realize that a high standard of responsibility has its reflex in the development of their own character. It also attracts to them a class of men who can afford to be discriminating in the customers that they select.

A man who buys on a service basis is bound to be cultivated by men who sell on that basis, and there can be no question that intimate, confident coöperation between men who buy and sell on the fundamental principle of giving the best possible service to the concern for which advertising is being developed is bound to place advertising itself on the highest possible plane.

The Necessity of Co-operation Between Buyer and Seller of Service

Much could be said about the observance of orderly, systematic habits, in relationship to one's own personal life as well as his associates in the business.

An advertising manager makes a mistake to allow any man in a responsible position inside his own organization to remain in an indifferent and especially in an antagonistic attitude toward him.

The function of advertising is to create good-will, and an advertising manager can hardly expect to organize and systematize the protection of good-will for his house as a whole unless he can himself master the art of creating good-will inside his own organization.

The Advertising Manager Must Command Good-will in His Organization

The general manager of a large institution told me once that his advertising manager, if he never wrote any copy, nor did anything else except to promote harmony and good fellowship between the many heads of departments, would more than earn the very large salary that he was being paid.

Another thing I would advise every young advertising manager to shoulder would be every bit of responsibility he could find floating around the institution in which he is employed. What a young man wants to do as quickly as he can is to create the impression that if there is work to be done he can do it, and then he should systematize his own work so that not over 50 per cent. of his time would be occupied in doing the actual details. A good executive can unquestionably so organize his work that he can be free at least half his time, to give audience to all the people who call upon him, and to go out himself in search of new ideas.

Shoulder Responsibility

I believe an advertising manager should accord an audience to every man who calls on him, at least once. If the salesman at that time does not demon-

strate that he has something of value for the house which employs the advertising manager, he is not entitled to second interview.

Give One Audience to Every Caller

An advertising manager wastes his time when he tells callers about his own achievements and what he intends to do, unless he does it deliberately, with the idea of stimulating more valuable suggestions or confidences from the people to whom he is talking.

The best way to get the whole story of any man who is calling on an advertising manager is to let the caller do all the talking; and few men have a story that will take them more than fifteen minutes to tell. A man who has posted himself sufficiently on the business of the house, who takes more time than that to tell his story, ought to be listened to with respectful attention, and encouraged to go out and get more helpful ideas on which specific suggestions of usefulness could be based. Nothing proclaims the business ability of an advertising manager more than his willingness to accept ideas and suggestions, and to freely accord credit to whoever brings such to him.

Be a Good Listener

REFERENCES ON CHAPTER XXI

"The Job, the Man, the Boss," by Blackford and Newcomb (published by Doubleday, Page & Co., New York), is a valuable book for an advertising man to read. It will help him determine the character of the men who call upon him, and it

will put him in position to advise and counsel with the executives.

"Thoughts on Business," by Waldo Pondray Warren (published by Forbes & Company, Chicago), are suggestive and stimulating to guide one's own thinking. It is well to remember that thoughts must be put into action constantly in order to prevent the thinker becoming a dreamer.

"How to Write a Business Letter," by Chas. R. Wiers (published by the author, 631 W. Delavan Avenue, Buffalo, New York), is the most thoughtful and practical treatise on this subject that I have seen. Anybody who writes will be benefited by reading Mr. Wiers' book.

CHAPTER XXII

THE ADVERTISING SOLICITOR

THE actual work of selling gives me the greatest pleasure of anything that I can do in a business way.

I have said many times that I do not think I am a salesman by nature.

It was wholly a bread and butter proposition that started me out to sell space on an Iowa newspaper which my father edited for over fifty years, and on which I secured whatever education I received after one year in a small academy succeeding my graduation at high school.

The first attempt that I made to sell space in our newspaper was both gruesome and ludicrous. I tried to persuade a man in the tombstone business to have a clearing sale, because from reading the Chicago daily papers I assumed it was along those lines only that retail merchants could advertise. Three months later when I called on the tombstone man he told me, with considerable anger, that I had done him a great injury.

A First Attempt at Soliciting

I asked him if nobody had read his advertisement, and he answered:

"I think everybody must have read it."

He then went on and said that he had lost ten good jobs which had been promised him by farmers if their harvest was good, because his competitor had told them he was going out of business, and the farmers would not have believed it unless they had read the clearing-sale advertisement.

I have said many times that all I know about advertising is what I gained in actual sales experience, from which I deducted fundamental working principles. I am perfectly willing to concede that advertising can harm the advertiser as much as it can help him. Advertising, in itself, is a good deal like food. Taken in proper proportion three times a day a man lives in better condition and does better work than if he alternately gorges or starves himself. He should not attempt to get along on too little or digest too much.

Advertising Can Harm as Well as Help

Advertising, to be successful, will always require fine adjustment and careful judgment based on actual knowledge of conditions.

In Chapter XXI I have indicated that an advertising manager who desires to give his customers the largest possible service for their money can well afford to cultivate the coöperation and confidence of printers, engravers, or dealers in advertising supplies who are creative salesmen in a true sense of the word.

This fact gives to the advertising solicitor his greatest opportunity. He ought to know accurately

the merits of the medium he represents. He ought to know what the medium he is selling will do under certain definite conditions. This is a part of his regular equipment.

A Solicitor Must Give Service

His success depends upon his ability to see that the person or institution which buys from him gets the largest possible service in results.

No retail merchant ever came in to buy space in the daily paper for which I first solicited advertising. The traveling patent medicine man, the advance agent of the circus, the man who came to the city to rent a storeroom and conduct a fire sale, always called on us and bought space with an apparent intention of appearing liberal and free-handed in their expenditures.

Some of the most valuable lessons that I ever learned was in assisting the retail merchant in writing copy for him. When I came to Chicago, in 1891, very few business men were willing to admit that anybody except themselves could write their advertisements.

Nothing has marked the progress of advertising more than the change of sentiment of heads of large business houses and even of advertising managers themselves on the question of who should write the advertisements.

Writing the Advertisement Once the Dealers' Prerogative

Ability to put into clear-cut, understandable English the sales-impelling thoughts of a masterful, creative salesman is possessed by few men. The physical appearance of these men is no indication

of their ability. They are not always impressive or personally magnetic, but they have the quality of putting words and phrases on paper, or of putting ideas into the form of pictures which influence thousands at a time to do what the personal salesman can get only one at a time to do after a talk lasting from twenty minutes to two hours in each individual case.

The Power of the Advertising Writer

The advertising solicitor's opportunity lies in understanding the service possibilities of the advertising accounts he is soliciting. He must be resourceful in ideas, and he must be able to impress people whose business he seeks with the thought that his medium and his ideas in connection with the use of the medium can give the largest possible service to the advertiser.

The Solicitor Must Understand His Prospect's Proposition

The service idea in advertising salesmanship is very marked to-day. It will be more so in the future.

The old idea of salesmanship that it is clever for a man to catch the buyer unawares and to "put something over" on him is being rapidly relegated to the discard. Nothing emphasizes this thought more clearly than to remember the men who were prominent in advertising salesmanship twenty years ago, and compare them in personality and methods with the men who are preëminent to-day.

The New Order of Soliciting

Often have I said that I was trained in the school

of salesmanship which taught that the best salesman had the most turndowns because he made the most calls.

There is no question that the lost sale is the greatest opportunity in advertising work to-day.

Overcoming Lost Sales

The salesman who sells advertising space or advertising material must himself master the art of overcoming as many of his own lost sales as possible.

The fact that men refuse to make sales when they could is one of the most effective means of winning the confidence of the buyer and insuring a hearing as against competitors whenever the buyer is again in the market.

This is itself a form of advertising which the advertising solicitor can most profitably cultivate. One of the surest ways to convince another person of your sincerity is to refuse to make money when the chance presents itself to you.

Turning Down Business a Royal Road to Future Business

When the buyer is convinced that you only want his money when you can give him the largest possible service for it, you emancipate yourself as an advertising solicitor from making many fruitless calls. You put yourself in the position where buyers will look upon your call upon them as an honor, and when they learn you are in the reception-room, or are telephoning for an appointment, they will feel that you have something to tell them that they cannot afford to miss.

Along these lines an advertising solicitor can build up personal prestige and loyal customers which overcome, to the largest possible extent, the handicap that a human being has a body that can only be one place at one time, and is able scarcely to stand up under more than ten hours' strenuous labor each day.

Building Personal Prestige

If I were asked to advise a young man who wanted to become an advertising solicitor, I would urge him to get a connection with a well-established, well-managed newspaper, magazine, printing, or engraving house. Select as an employer one that has a reputation of making good upon every responsibility, and pay no attention to what the salary is the first year.

The next step would be to make up a list of prospective advertisers, selecting people who are logically situated, because of their position in the market, to deliver a larger service to the group of people that your advertising mediums serve better than any other.

How to Solicit Business

Learn everything about your own medium; and the best way to do this would be to simply go out and make calls. When a man asks for information, jot down his question in a memorandum book. When you go back to the office have this answered by the man who knows most about it, and the next time the same question is asked you can answer it clearly, succinctly, and definitely.

You will be surprised to find how in a little time you will be able to have ready at your tongue's end

clean-cut, definite, convincing answers for practically every question that a buyer will ask.

Always present the merits of what you have to sell from the viewpoint of how it will assist the prospective advertiser in what he is trying to accomplish in his own market.

Avoid discussions of technical detail.

Things to Avoid

Never discuss competitors. This is the safe path for young solicitors to follow, and is usually followed by old-timers who are in position to discuss competitors intelligently and accurately. Their time is too valuable to do otherwise.

The best-informed salesmen that I know, if they discuss competitors at all, generally get the buyer to state in his judgment what is the most favorable thing regarding the competitor; then, conceding this, they proceed to show how their own house is even better equipped along this same line.

Soliciting Is a Serious Job

The advertising solicitor should take his job seriously. He should be serious in his approach and in his discussion of business matters with the buyer. He should never joke about his own business or talk flippantly about it. He cannot command the respect of other people unless he treats his own business respectfully. Confidence and respect are so interwoven and synonymous that it is difficult to separate them. Confidence is the only basis on which the permanent business building sales are made.

By this I do not mean that a man shouldn't joke

or laugh and have a good time, but I do mean that his stories should be clean, and his jokes should be about things outside of his own business, and not in any way reflect on the honor or the integrity or the ability of the people associated with him or of the house that he represents.

The Solicitor Must Know —Bluffing Doesn't Go

An advertising solicitor should know more about the use of the medium that he represents than the man he is soliciting. He should make the man to whom he is talking believe this, and the best way to do it is to be so strongly equipped with knowledge, facts, and figures of how his medium has been used that he can discuss the subject accurately and intelligently.

The advertising solicitor should be very definite in his statements. He should not deal in generalities. He shouldn't tell a partial story. If he gives a definite transaction in detail, he should tell both the good and the bad, and endeavor to show how any bad features could have been avoided by forethought.

Plan Your Work and Work Your Plan

One of the best rules for an advertising solicitor to follow is the old one "Plan your work and work your plan." The advertising solicitor should avoid antagonizing the buyer, and for that reason he shouldn't discuss outside subjects with him on which he would have a justifiable difference of opinion.

Under no circumstances should an advertising solicitor or a salesman allow criticisms to be made of the house he represents. This is the most serious re-

flection that can be made on his own judgment. If a man is a good salesman he does not have to connect himself with a poor house.

The best houses in the world are ready, open, and eager to hire more salesmen of the right sort.

The salesman who allows a buyer to say that he is all right but that his house is wrong is committing business suicide. If the house is wrong he should quit it—if it is right he should defend it and absolutely discountenance unfavorable criticism.

Selling Space for Big Publishers a Big Job

There is no work in which a man has a more pleasant opportunity to exercise the best there is in him than in the sale of advertising space for a large institution. He is working with 13-inch guns, but he is doing things in a constructive way to help mankind rather than to destroy people.

The opportunity for big men as advertising solicitors is much greater to-day than the supply, but the amount of training that is necessary to develop men for those positions is greater or fully as great as is necessary to fill large places in law, medicine, architecture, or engineering.

It is the old story that it takes more time to lay the foundation for a twenty-story building than it does for a two-story cottage.

The Hunt for Good Men

Young men want to be willing to work and learn while they are developing. The training of the judgment is an essential factor in making one ready to fill the large positions that are open.

Fortunately, judgment is something that can be trained—judgment is experience, intensified by clear, analytical thought. Judgment gives men courage to try things over and over again that they figure out in their own minds are fundamentally sound, with the conviction that all obstacles will be ultimately overcome.

The two largest publishing interests in the United States are conducted by men who are conspicuous for periodically going out on what they call "A man hunt." The large positions in their organizations have been recruited from all over the United States.

Men in small places (who have fulfilled responsibilities in a well-rounded way) are sought for to fill the larger positions. A well-rounded character, the ability to see below the surface, the courage to continue no matter how many rebuffs one receives, the confidence that sound business principles will ultimately prevail, a rigid adherence to what one is convinced is sound basically, tempered by courtesy, kindness, and forbearance, is bound to win in the long run.

The advertising solicitor has more things to meet that will prevent him from being successful than in any other line of business with which I am familiar. Mastering all these difficulties, he gains the satisfaction of achievement and accomplishment which maintains his own self-respect. This, after all, is the ultimate goal in life that is well worth striving for.

REFERENCES ON CHAPTER XXII

Every chapter in this book and all of the references thereto are supplementary reading that I can heartily commend to every man who aspires to be an advertising solicitor.

The daily papers, the monthly magazines, and especially the trade papers, in any line to which an advertising solicitor is giving special attention, should be carefully read for new ideas or revivals of old ones and the extent to which they are taken up by one or many groups.

The editorials of Arthur Brisbane in the Hearst papers should be carefully read, for three reasons: (1) he understands the group spirit and knows how to hold the continuous attention of a very large portion of the reading public; (2) his remarkable ability of keeping in close touch with the development of scientific and philosophic thought, and (3) his masterly style of interpreting technical subjects in plain, simple language that any one can understand.

It is my firm conviction that an advertising solicitor ought to be continually reading the works of men who have given long thought to specialized subjects and put their ideas on paper; such works are Ruskin's "Unto This Last"; George Horace Lorimer's "Old Gorgon Graham: More Letters from a Self-made Merchant to His Son" (Doubleday, Page & Co., Garden City, N. Y., 1904); Otto Weiniger's "Sex and Character" (G. P. Putnam & Sons, N. Y., 1906);

Crewson's "Tales of the Road" (Grossett & Dunlap, New York), and H. G. Wells' "War of the Worlds" (Harper Bros. & Company, New York, 1909).

All these books stimulate thought and suggest new ways of approaching the solution of fundamental problems.

CHAPTER XXIII

THE ADVERTISING AGENCY

BENJAMIN FRANKLIN'S mother-in-law objected to him before he married her daughter because the business in which he was engaged was overdone—he was publishing a newspaper, and there were already six in America! Now there are 22,141—2,600 dailies, 15,097 weeklies, 2,491 monthlies, and 1,953 of various other kinds. Practically all of them carry advertising.

The business of soliciting, preparing, placing, checking, and paying for all the advertising space involves an infinite amount of detail and a wide range of talent.

Nearly all retail stores buy space direct from the publisher, who may be represented by one or more advertising solicitors. It all depends upon the size of the field. In large establishments the advertising manager may write the copy. The owner of the store may attempt it. He may use copy writers proffered him by the publisher. Or he may employ a "free lance" copy writer, who will, of course, have a number of other customers.

A mail-order house generally buys space through an

agency. It either has its own copy men, or uses those allotted to it by the agency.

Foreign advertising is the local publisher's term for out-of-the-city advertising. The national or "foreign" advertiser usually places his business through an ageney. These agencies furnish a service which varies greatly in scope and character. The suecessful advertiser must supplement in his own organization the service he needs but does not get from the agency.

To understand the present status of the advertising agency, read George P. Rowell's "Forty Years an Advertising Agent," whieh tells of the early days when an ageney was merely an office with a list of publishers' rate cards, files for papers, and a shipping department. The agent sold space at publishers' rates, forwarded the copy to the publisher, collected from the advertiser, and remitted to the publisher the proceeds less his comunission. It was a valuable service then. Newspaper circulation and values were hard to get at. It was a service for publisher and advertiser.

The Early Days of the Agency

In time, however, competition arrived. Publishers increased their commissions, and their rates had to go up accordingly. As publishers did not limit the number of representatives they might have, the number of agents increased rapidly, and their competition gave rise to many bad practices.

Commissions were split. The agent, sometimes honestly and sometimes not, adjusted his service to

the compensation, accepting a lump sum for a list of publications, but making as much as possible out of the publisher by short payments, refusing to allow for alleged incorrect insertions and short measurements, and by payment in type, printers' rollers, and other kinds of merchandise instead of cash. This was "playing the game."

The Era of Split Commissions and "Agents' Net Rates"

Then came the era of the agent who took business at a certain percentage over net, and "agents' net rates" were commonly interpreted as the publisher's rate card less his regular agent's commission. The customer was billed at this rate plus 10 to 15 per cent. previously agreed upon. And the agent felt he was justified in keeping anything else he could get from the publisher.

This system irritated the publisher, who still had his troubles with short measurements, incorrect insertions not allowed for, and various other expensive and harassing deductions which left him no time to consider how he could best serve the advertiser. It kept him quite busy making sure he would get the money his orders indicated was owing him.

Then came the race of agents who, realizing the value of the publisher's good-will and coöperation, specialized on some certain class of advertising, and got inside special rates from the publication most logically suited to carry it. This made it possible for him to underbid competitors when they were called in against him;

The Lowest Bidder Secured the Business

and to make a very long profit when he had no competition. This practice further demoralized the advertising business. There was so much juggling of rates that strong publications employed special representatives, who should see to it that advertisers were informed of their circulation, prestige, and other good points, and to see that their papers appeared on competitive lists.

The special agency idea was abused by a number of men who bought outright all the space in a group of papers, and then increased the rates. Or, because they had a few strong papers on their list, would induce the advertiser or his agent to take on the whole list by making apparent but not actual price concessions.

The fact that the advertising agency has survived all these schemes and questionable practices is a sincere tribute to the inherent power of advertising to make good, even when the odds are against it. It is also a tribute to the integrity and constructive ability of the men engaged in the business to-day. In spite of the fact that at times both agent and publisher have been doing business with the advertiser on a basis which almost *invited* an unfair deal, they have established their position—because they have made good with their customers.

Of Present-day Agencies There Are Four Types

Much might be said about the history and development of the advertising agency, but we can take time only to consider the four definite types which are now in existence. In this count I am not including a variation now practi-

cally extinct—the man who merely clears business at a small advance on the net cost. He cannot make good any more, for most publishers either refuse him any recognition, or else give the service agent a so much lower flat rate that he cannot deliver.

The Agency That Sells Copy Service

There is the agency which sells copy service, but does no placing. It may be one man, or a group. The charge is usually a fixed amount, weekly or monthly. They handle none of the details of buying or contracting space. Their methods are open and straightforward, and the copy is usually satisfactory and well worth what it costs. Their customers know exactly what they get and what they pay for.

The Agency Which Places Business at Publishers' Rates

Type 2 is the agency which solicits and places business at publishers' rates, writes copy, and gives a certain amount of merchandising counsel. Most of the men who are doing business on this basis are honest, capable, and successful. But I think this system does not pay them, neither does it pay the publishers nor their customers. The customer does not always know how much he is paying for agency service and how much for space. A weak publisher may secretly increase his commission to the agent, and because the advertiser is doing business at publishers' rates he would not be informed of the change. The agent himself often has a wrong conception of his proper relation to the customer and the publisher. He is apt to think it is the publisher's commission that

gives him his status—when he should know that it is the advertiser's money that is paying for both space and service.

Type 3 is the agency which tells its customer it will charge him 10 to 15 per cent. above net; and then asks the publisher for protection by allowing a commission.

The agent who charges publishers' rates is a publisher's representative, and must look to him for protection. Such a man must cast his vote with the publisher in case of conflict. Most publishers recognize that the advertiser is entitled to a square deal, and they implant this thought in the minds of the agents who do business at publishers' rates. This is the only assurance the advertiser has of being well served by such an agency.

Agents of Types 2 and 3 Cannot Fully Represent the Advertiser

On the other hand, the agent who offers to charge a certain percentage above net, as guarantee that he will not allow himself to be influenced by any increased commissions offered him by the publisher, and then asks the publisher for larger commissions (not lower rates) for protection, is carrying water on both shoulders and cannot represent anybody—not even himself—for any length of time.

This type of agent is in hot water continually. If he is doing business at publishers' rates, he can keep for himself any rebates, discounts, or free space (publishers do not generally offer these things to advertisers direct). If he is charging 10 to 15 per

cent. above net, and at the same time asking the publisher for favors for himself, neither he nor any one else knows whether he is really entitled to free space, special discounts, cash advances, bonuses on volume of space used within a certain time, short time rates which the customer may have paid to the agent but the agent has not paid to the publisher, and other profitable perquisites which an appreciative publisher is glad to allow a producer.

The Evils of the Agency System Which Does Not Represent the Advertiser

This kind of business must go as surely as the 5 per cent. "placer" has gone. I believe the publishers' rate agent is to be with us for many years, perhaps permanently, because he is apt to specialize on a certain classes of mediums, and to be a truly important business-getter for the publisher. If he is an honest and able man, and he usually is, his service is well worth what the advertiser pays for it, for it is the advertiser's money that pays for both space and service.

Type 4 of agency is my ideal. A number of successful organizations have realized its main features in everyday practice; so that I can safely say the type is well defined. It is an outgrowth of the organization idea. It proves that coöperation and specialization develop a higher standard of service than can be attained by an individual, and that the advertiser will get more for his money if he grasps its methods and adjusts his own organization to it.

The Highest Type of Agency Sells Service to Its Customers

Such an agency sells service, and nothing else. It should have no ownership interest in space or supplies it buys for its customers, nor any stock or financial interest in the business of its customers.

The Best System of Agency Compensation

Its compensation should be a retainer fee, for advice and counsel and the relinquishment of any conflicting interests, plus a percentage on the amount of detail work handled or a specified amount per day for the actual work of its various members. By far the most satisfactory system is a minimum monthly fee which is credited against a minimum 15 per cent. service charge to be added to the net amount of all purchases and deliveries of space and supplies.

The Four Definite Functions of the Advertising Agency of the Fourth Type

This organization has four definite functions. It can, if properly equipped and intelligently managed, do each of these better and more economically than the advertiser can. They are:

1. *Counsel of Mediums.* The organization which undertakes to advise for or against any advertising medium should have had constant successful experience in the use of all kinds of advertising mediums. A fully equipped agency organization should make money for small advertisers who use only one medium; as well as for larger businesses which use several in combination. Its experience should cover newspapers, magazines, trade papers, mail-order mediums, all class publications, street cars, electric signs, painted bulletins and

walls, and all sorts of printed or lithographed matter, follow-up material, and novelties.

2. *The buying power* of an organization is kept unimpaired by refusing to accept anything from publishers or space producers for itself. I believe that the ideal organization must refuse to sell its service, under any circumstances, to publishers or space producers, or to any one else from whom it may buy for its customers.

The number of advertising mediums which have a fixed rate is small, though all the best ones do. A complicated rate card is a challenge to the trained space-buyer. Many mediums offer a net flat rate to large agency organizations, for the reason that they are wholesalers. Their customers are rebated the difference, of course. Where there is an opportunity for trading or dickering, it is certainly advisable to employ a man who knows how to do it. It is quite generally conceded that the space-buyer for a large agency organization holds a very responsible position.

The agency buys outright, and pays for space at once, in cash, which is an important factor in buying. The buying department of such an organization has nothing to consider save the actual value of the service offered; it is, therefore, in better position to get a low price and collateral coöperation than the agency which asks the publisher for a commission and protection.

3. *Copy service.* No matter how carefully mediums have been selected, or how economically space has

been bought, it is without value to the advertiser until it is filled with copy which will get the desired result. The copy staff of a successful organization must represent the picked men of a nation, working together harmoniously in confident coöperation with the advertiser's organization.

Sometimes, after the analysis has been finished and the selling points agreed upon in conference with the advertiser, one man writes all the copy; sometimes several men work on a national campaign where there are several groups of consumers and trade literature and selling helps to be taken care of.

4. *Sales coöperation*, the most recent development of agency service, has been misunderstood in many places. It does not mean sales direction, nor the displacement of salesmen. Sales coöperation means getting more service from the publisher and space-producer, because you can convince him that the best way to entrench his own business is by giving the advertiser more for his money. It also means making the advertiser's salesmen more valuable to himself and to his principal.

The very best salesmen make many calls which are non-productive. Anything which increases their percentage and volume of sales as compared with calls makes them more valuable without increasing their labor. Sales coöperation is the result of applying the principles of scientific management to selling methods. It is sharing with salesmen the responsibility of planning their work. Advertising does the

missionary work and the salesman becomes an expert "closer" and business-builder.

Nowadays a banking corporation regards itself as the trustee of its depositor's money, and does not loan money to any business in which its officials are interested. The same general principles should govern the conduct of an advertising organization.

The Advertising Agent a Trustee of the Customer's Money

Advertisers should have at all times access to the books of the organization which places their advertising. Once each year they should receive from an audit company a report which shows that their advertising appropriation has been spent as had been agreed upon.

Advertiser Should Have Access to Agents' Books

The highest type of advertising service is offered by the organization which attracts as customers only those businesses which are acknowledged leaders in their respective lines, and then at all times regards them as a group of non-conflicting interests coöperating for their common good.

The Agency of the Highest Type Will Advise Against Advertising if Advertiser Is Not Ready for It

Such an organization will advise *against* advertising if the advertiser is not ready for it. It will tell him, how, when, and where, advertising should be done. It should be consulted long before the advertiser starts to plan about prices, distribution, the package, selling methods, and the instruction of salesmen about ways and means for cashing in on the advertising.

CHAPTER XXIV

ACCOUNTING

NO ELEMENT of successful advertising is more important than a system of accounting which records all transactions accurately, so that the totals unmistakably show the trend of the business as a whole.

Advertising is creative and constructive, and largely a matter of spontaneous expression—the best reason in the world for knowing how to determine exactly the strength and competency of it as a productive force, and the positive value of each separate factor thereof.

Accounting That Provides a Ready Basis for Advertising Deductions

Accounting is not a matter of books, cards, blanks, and specific forms. It is keeping track of the details of advertising all the time, so that they may be considered in the aggregate as well as separately frequently, and intelligent deductions made therefrom. There is a good deal of red tape about modern accounting. Some of it is valueless, but much can be accomplished if there is a proper system of recording everything that is done. The cumulative figures will be full of meaning.

I have often said that my most valuable business experience was that gained during the installation of an accounting system in our business some years ago, and during the process of emancipating ourselves from the system by putting into practice the principles which supported it. We all got a thorough grounding in the essentials of accounting.

Proper Distribution of Overhead Expense

Frequently I have been appalled at the inadequate knowledge upon which a prospective advertiser was basing his conclusions. So often overhead expense is not properly distributed in figuring costs. In the one case a particularly profitable transaction may be made to bear far more than its share of general expense; in another case a positively unprofitable item, which, however, *appears* to be making money, is continued—*because* it has not been charged with its rightful portion of overhead.

It is my conviction that each department of a retail establishment should be charged directly with every line of publicity for which it has been responsible and from which it is to profit, and that "general publicity" or "cumulative results" should be "velvet," or a plus commodity.

Advertising that has for its purpose general publicity is usually purposeless publicity. Even if it does accomplish what it is expected to do, it is only half as valuable as it should be; for the same results would have been had, at no cost whatever, had this publicity been charged and paid for by the proper department.

A simple, accurate system of accounting, to check up results, is necessary to "make advertising pay." If a salesman is able to reduce his percentage of unproductive calls by talking the advertising of his house in addition to the worth of the goods, or if he is able to increase the amount of his average sale, his reports should show it. All salesmen's reports should be tabulated, so that the sales manager can plan intelligently for the future. Such a method does not work the salesman any harder, mentally or physically; but he accomplishes more, is worth more, and is entitled to know of his increased value and to receive a fair share of the profits of his coöperative work.

Checking Up Results Should Be Made Easy

Every accounting system should be able to give the executive head of the business all he wants to know, whenever he wants to know it, and in such condensed form that a comparison or an analysis will be simple.

The Executive Should Be Able to Know Anything He Wants to Know at a Moment's Notice

On the opposite page a sheet from a daily time book devised by Herman A. Groth, Secretary and Treasurer of the Mahin Advertising Company, is shown. You will see at once how easily and exactly each man's time can be recorded there. Any one can use this blank, no matter what his business. And I guarantee that if the habit of using it is formed, and the summary studied each month, many useless or unessential tasks will be omitted and the more profitable ones developed into expertness.

This Record to be filled out each day by Executives, Department Managers, Copy Writers, Service Managers, and Representatives of the Mahin Advertising Company.

Nothing impresses a banker more than an exact system of accounting. To most bankers advertising is more or less of a mystery. The manufacturer must establish in his banker's mind something besides the fact that he *is advertising;* he must convince him that he *knows how to use* advertising so that it will get results.

Good Accounting an Asset in Negotiating a Loan

When you call on your banker for a loan, there is just one kind of advertising that he will look favorably upon—the kind that has been so accurately recorded by a comprehensive accounting system that you can *prove* to him that it has accomplished what it set out to do.

The building of a national good-will bears a direct relation to the amount of money spent for national advertising. I have known many an advertiser who at the end of three years of national advertising would not sell the brand he had established for all he had spent for national advertising in those three years, although it had been charged off to expense each year. When a business is being sold, the amount spent for general advertising is often the basis for computing the value of the good-will.

The Relation of Advertising to Good-will

I certainly do not advise inventorying advertising expenditure as an asset, but I do believe an account showing the annual expenditure for each brand which has a national sale is properly an item of a financial statement. I think the time is coming when banks

will ask for a statement by years, for profits may not be radically lessened for a number of years after advertising has been dropped. But the original net profit could not be restored without spending all profits for advertising for a year or two, or perhaps more.

An Accurate Record Should Be Kept of Annual Expenditure for Advertising Each Product

Most people, if asked to name the highest mountain in Colorado, would say "Pike's Peak." But the fact is there are twenty-six that are higher. There are many articles that are really staples and are known only by their trade name. No one knows whether there are twenty-six, or more, equally good ones. The consumer's preference, which is a mixture of experience, familiarity, and friendliness, is the manufacturer's biggest asset. No one could estimate how many pages have been written about Pike's Peak, or how many times its name has been mentioned in magazines, newspapers, or by word of mouth; but all agree that in that way, and only in that way, has it acquired its distinction with reference to other Colorado mountains.

Granted, then, that what has been written, printed, and said about a certain staple is what gives it preference, it follows that an accurate record should be kept of the cost of this favorable mental attitude, and that due regard be paid to the expenditure necessary to keep this investment intact and enhance its value if possible.

It is impossible to say just how much should be

spent for advertising, or how much for salesmanship. I can only repeat that price is never a measure of value. It only measures the pocket-book's relation to the intensity of desires which have been created by personal salesmanship and advertising. Practically every one has more wants than he has means. Lowering the price broadens the market; raising it, contracts the market. Many people who have unlimited means gladly pay for exclusiveness and distinction. Price never can determine or measure intrinsic value.

How Much Should Be Spent for Advertising

A five-dollar safety razor leads the market against a competitor which sells as low as 25 cents. How is it done? The manufacturer put his price high enough, at the start, to provide him with a margin of safety. Then he has had to determine, by accounting, whether the market shall be widened and competition discouraged by reducing the price and making on volume, or if he shall keep up the price and give his goods the added value of distinction and exclusiveness.

If there is one idea that I wish more than another to have impressed upon the readers of this book, it is this: successful advertising is the active employment of many factors properly balanced with relation to each other, inter-related, one to another, so that their movements coördinate without waste or friction in carrying out plans capable of varying to meet an emergency situation but bearing directly toward a fixed goal. If I have made

Successful Advertising Defined

this point clear, the importance of careful, comprehensive accounting, up to the minute at all times, is obvious.

Advertising is so many sided—it builds and conserves business, it reduces expense, it strengthens credit, it eliminates waste, it puts a business on a rock foundation, as immune as is possible to competition—that facts and figures with reference to it cannot be too carefully gathered.

No one can accomplish much in this age without using some phase of advertising. And if this book shall inspire some to make use of it in a wholesome, helpful way, I shall be well repaid for the pleasant labor of producing it.

REFERENCES ON CHAPTER XXIV

Twenty-five years ago I read "Goodwin's Improved Bookkeeping and Business Manual," published by J. H. Goodwin, 1215 Broadway, New York City. It seemed to me then to expound the fundamental principles of accounting better than anything I had been able to get hold of.

Quite recently I asked George F. Watt, president of the Elliott-Fisher Company, Harrisburg, Pa., maker of The Bookkeeping Machine, about this book, which has been rewritten and brought up to date.

Mr. Watt told me when he was vice-president of the Baker-Vawter Company he inaugurated the policy of giving a copy of this book to each new sales-

man, to make sure that he thoroughly comprehended the basic principles of accounting.

The Baker-Vawter Company, Benton Harbor, Mich., and the Burroughs Adding Machine Co., of Detroit, Mich., issue booklets emphasizing the broad scope and value in creative work of modern accounting methods.

"Works Administration," a twenty-eight page booklet of Gunn, Richards & Co., New York City, is a model piece of advertising matter for a professional house, as well as an exposition of accounting principles.

"Accounts—Their Construction and Interpretation—for Business Men and Students of Affairs," by William Morse Cole, A. M., Assistant Professor of Accounting in Harvard University (Houghton, Mifflin Company, Boston), is an authoritative presentation of modern accounting in its scientific aspects.

APPENDIX

The following communication was published in the Chicago *Record* (since absorbed by the Chicago *Herald*) on September 30, 1896:

FREE COINAGE OF LABOR

If free coinage is such a good thing, why not have free coinage of labor? The proposition that a miner of silver can take his silver to the mint and receive a fixed compensation for it is an excellent thing for the man who has silver. If this could be done, and a ratio of 16 to 1 be actually maintained with gold, it would show a handsome profit to the silver producer, or, if it should prove that free coinage would bring the dollar down to its intrinsic value in silver, it is still a convenience to the silver mine-owner to have a ready market for his product.

In the interest of labor, it seems absurd to urge the free coinage of silver. Who has silver? Anybody but the mine-owner?

Must we assume the worry and unnecessary labor of rearranging our system of business, our fixed values, our railroad rates, and our government salaries by changing our standard of measurement, simply to accommodate him?

But there is one thing every man possesses which he should in a wisely ordered government have a free and unrestricted market for, and that is his labor.

I would join heart and soul in any movement which

sought the free coinage of American labor. A government which kept open an opportunity for every able-bodied man to turn his day's labor into not less than $1.50 to $2 in money on the gold standard would furnish an equilibrium for business, and do more to prevent depression and panic than any system of metal coinage that could be devised.

See how simple the proposition is. Here we have 70,000,000 of people. Of that number there are perhaps 12,000,000 able-bodied men. Every person in the United States is fed, clothed, and housed every day. People are not dying of starvation. In exchange for food, shelter, and clothing, what does man give in return? His labor.

With a free and unrestricted market for his labor, his productive capacity is increased. He is able to add more to the actual wealth of the country and secure a larger portion of it for himself.

Every day spent in searching for employment, every idle day spent in waiting while mills and factories are shut down, means a loss of production, while steady, regular employment, with its proceeds properly distributed, means an increase in the comforts and possessions of the people.

If every man in the country were absolutely sure he could market his services for not less than $1.50 a day, what ease of mind and comfort of body it would mean to the laborer—he would be able to act independently of harsh employers and be assured of support for his family.

This would make $1.50 a day a minimum price and would act as a regulator of the labor market. It would insure a steady and regular income for the laboring people and thereby establish a fixed and firm foundation for trade and business.

I would not have this market in the form of a sinecure or fat political job. I would want to see it simply a government affair where any one out of work could go for three months at a time—transportation to and from the place where work was going on free—and receive $1.50 a day, or its equivalent, less a fair and reasonable cost of board and lodging, which should be similar to that furnished soldiers in the regular army.

The government could undertake great public works—canals, fortifications, harbor improvements —under this system, and when times became better and wages rose above $1.50, as they did in 1892, the work could be contracted to a smaller scale, and when times became dull and the demand for labor became scarce, the government works could be expanded again under the direction of army engineers and officers, of which there are plenty waiting around for something to do.

No one will object to the government issuing bonds to furnish funds to pay labor of this kind in dull times if such were necessary, which is not likely, as a normal healthy business system would undoubtedly be the result, and deficient revenue would be very unlikely.

It would entail no additional burden on the people at large, as every one in the country must be supported in some manner. By this system there is gained the result of every worker's labor in addition to the self-respecting and well-ordered mind possessed by an employed man.

If unskilled labor has a ready market, skilled labor needs no assistance. It will take care of itself.

The prosperity of a country rests upon the prosperity of its unskilled labor. A scheme like this would act as the governor of a steam engine to reg-

ulate and keep in a steady and even condition the foundation upon which a healthy and aggressive business must float.

One of my friends says this is socialism. But under the circumstances I have described where could there be anything but good results from such a procedure?

It certainly is fairer to all men if we have free coinage of anything at a fixed value to have that which all men possess and can give if they so desire.

There is certainly no discrimination or favoritism in it. It would greatly simplify the demands in charity to refer all able-bodied men to the government works where all who would could work and be paid for it.

INTRODUCTION

This work is written primarily for the salesman, or the man or woman who contemplates taking up selling work. I hope, however, that it may have some helpful suggestions as well for the sales manager, or the head of the house. It presents the problem of the one who sells either at wholesale or retail; of the salesman who calls on the trade or is called on by the trade, of the man who writes the sales letter, dresses the window or the display counter, or who writes the advertisements. Each may have a different line of work, but his problem is the same,—first, to get attention; each must have it. Then their problems run parallel in the effort to secure interest. There can be no selling without interest. Probably the work of each continues in the endeavor to secure desire which carries the necessary impulse to buy, and finally in obtaining the decision to buy, properly carried into effect.

The traveling salesman carries his samples or his articles for demonstration. This and his knowledge is his equipment. The salesperson in the retail store has the goods or articles in

stock and his knowledge for his equipment. The man who writes the sales letter has only his knowledge of the goods and of those who are expected to buy them. This knowledge and his letter are his equipment. And so with the advertising man; his knowledge and his copy are his equipment. Each has different equipment with which to work out the same problems. Each depends on getting his message along certain pathways to the brain, the writer through the sense of sight, the personal salesman through as many of the senses as possible.

Studying these branches of selling in this associated way ought to give a broader idea of the science than could be obtained otherwise. The different branches are treated as comprehensively as this single volume will permit, every important principle or practise being brought out. The usual amount of detail, much of which is often tiresome in works of this kind, is eliminated without sacrificing anything of consequence. Unless otherwise directed, we generally begin our study of selling inductively, reading only such works as pertain immediately to our particular branch. Not until we have come into executive work do we realize, as a result of wider observation and experience, the importance of the study of all branches of selling as brought out in this work. This general survey

of the problems ought to give the salesman breadth and understanding which he could not get in the reading of any volume relating to his particular branch of the work. I hope that this discovery of the similarity in the problems of each branch will be an incentive to the reader to go into the individual branches still deeper, and eventually give him knowledge that will serve him well in executive work.

MODERN METHODS IN SELLING

Modern Methods in Selling

CHAPTER I

THE SELLER

This is an age of intensification. It is a time when new theories are constantly being worked out and put into practise; when we are striving to get the most with the least effort and expense; when idle talk and false motion are being minimized. Inefficiency loses millions each year, therefore men in all lines of business, who are awake and grasping the importance of the situation, are studying their employees, watching and recording their movements, and their talk if they be salesmen, rearranging them, readjusting their machinery, supplying them with different, more effective equipment, and improving their working environment; and all of this to overcome some discovered lost or false motion. Mr. Lewis describes the modern tendency well in *Getting the Most out of Business*,

"There is no doubt that the entrance of the scientific spirit of the engineer into all the administrative and executive functions of business has changed the rules of the business game. Business will never again be the same comfortable, happy-go-lucky, go-as-you-please occupation it once was.....Should we not make a careful, scientific study of man in relation to the work he does—whether it be in the factory, salesmaking, advertising, keeping a set of books, operating a typewriter, or sticking stamps on a wrapper? Out of that study will come facts which we may classify into general laws and principles, the skilful application of which must make the most successful business, the most contented workers, the most peaceful and prosperous society."

Selling has not been overlooked. Certain scientific principles have been and are being found to govern it. Certain laws may be applied to it, the application of which improves and intensifies it. There is a most efficient and satisfactory way to sell, and the good business men of to-day are, by constant study and experiment, gradually finding and applying it.

As I have already stated in the introduction to this volume, the general relation between wholesale and retail selling in person, sales letter-writing, advertising, and even window and store display, is so close that the principles

that apply to one will in a general way apply to the others, even though their method of application will be different. The underlying mental steps of the process are the same; the elements entering into the making of the sale are the same. Stripping the sales process of everything but the fundamental, what is the sale? How is it made? Who and what are involved in it? The sale, whether it be made by personal call, over the counter, by letter, advertising, or display, may be reduced to this simple transaction;——a contract between two people, one to sell and the other to buy some tangible or intangible thing. I, the seller, may be the manufacturer selling at wholesale, or the salesman representing him. I may be the retailer operating the store in a certain city, or I may be the salesman behind the counter. I may be the sales letter-writer in the office of the manufacturer or retail dealer, or possibly in my room at the hotel as a salesman. I may be the advertising man, appealing to groups rather than to particular individuals, representing either the wholesale dealer or the retailer. No matter what may be the branch of selling under consideration, we have four very apparent angles from which the subject must be analyzed and improved.

First the seller must be considered; and we shall vary here from the usual treatment of this angle and consider the seller in his broadest sense. Primarily the manufacturer or jobber or retail dealer is the seller, and coming secondarily is the salesman, or sales letter-writer and advertising man or other representative. We can not hope to get very far with the buying public unless the maker or manufacturer or dealer is right in his methods and policy. The ability, and energy, and accomplishments of the salesman or other representative will be of no avail unless what is back of him measures up to the usual demands. Nor can we hope to get very far unless the salesman or other representative has the personality and ability demanded in his line of work. He goes out personally, or, if it be the advertising man, in the advertisements of the company, to educate, and appeal, and represent. His virtues are the company's virtues, his failings the company's failings.

Now let us consider the second angle of the sale. How about the buyer? The sales manager, the advertising man and the salesman are most directly concerned with the buyer. Whether he be the individual on whom the salesman calls personally, or the group of individuals to whom the advertiser or letter-writer or

window-dresser is appealing, the knowledge of the buyer which must be gathered is substantially the same. It is the knowledge of human nature; the knowledge of men and their make-up; the knowledge of instincts, interests, emotions, desires and habits, and how to appeal to them; and with this the knowledge of character as expressed externally,—all important to the representative who must come into contact with the public, the great group of buyers.

It will be conceded that we can not go very far in selling unless the thing to be sold comes up to required standards. Has it the quality? Is it designed to meet the needs of the greatest number possible? Is the price reasonable? Can it be marketed profitably? Are transportation facilities favorable? Can we meet competition in giving service? Have we a name that means something,—descriptive, easily pronounced and remembered? How about the containers, sacks or packages: are they of good design? Do they serve as good or poor advertisements? If it is an intangible something like insurance, does what we have to offer measure up to what is being offered by competition? We must have something worth while, put into attractive form, otherwise our selling scheme breaks at this point.

With the seller and the thing to be sold in proper form, and with proper knowledge of the buyer, we have the remaining fundamental to be analyzed;—playing the game, making the sale. What is the most effective, most economical way to influence the buyer to purchase what we have to sell? Having all of our other equipment in proper order we center again on the buyer in making the sale. From whatever branch of selling we may be working we shall find that the mind must be appealed to through the senses and instincts, through the great group of interests, the emotions, motives or desires, and habits.

THE SELLER AND HIS OBLIGATIONS

From the point of view of the seller, let us mention some of the obligations which rest on the manufacturer or jobber or retail dealer if he is to expect the best from his representatives, the salesman or advertising man. As we have stated, he is primarily the seller, and must be considered with the salesman or advertising man in the analysis of the subject. He must be ready to give a square deal. There must be honesty in the manufacture of his product, giving quality where it is due. His policy must be equitable, impartial, tactful and reasonable.

The public knows quality and demands it. The manufacturer can not expect his representatives to build up a lasting business without cooperation in this respect. If I were a salesman again I would not consider wasting my time in the field for any concern that did not have sufficient respect for this fundamental. It is needless to say another word about quality.

And the importance of service seems to be so well established in business that it need only be mentioned. It must be a good, dependable, keeping-the-word-good service, whether it be at the factory or store, transportation, or that which is necessary in the use of the thing being sold. The essence of service in the cement and plaster business is to deliver when we say we will, and when the dealer must have the product. The essence of service in the battery business is keeping these sensitive batteries inspected and in proper condition to give satisfaction.

The modern public looks for character everywhere: in the salesman, in every department from the sales to the credit, in the personnel, in the product. The department heads, employees, the factory, offices, store, advertising, correspondence,—everything that is in any way associated with the seller's name must have character.

The seller is under obligation to give his representatives who deal with the public the very best ideas that have been gathered from the experience of others in the business. It is a poor sales office that is not a clearing house for the experiences and suggestions of the many representatives in the field, office and plant, or in the store. The best should be selected and used. The engineer is doing it every day, and has been for years;—selecting and using the best;—standardizing. Our progressive selling organizations have been standardizing just as carefully every step and every word in many cases, that the salesman is to take or say. The salesman is neglected to-day if we do not give him the benefit of standardization, a highly constructive word in selling. If the organization for which I happened to be working was not standardizing this would be one of the first suggestions that I would have to make.

The sales manager should relieve the salesman of all the preliminary work possible, and let him devote his efforts to the higher work of closing sales. As we shall show in the chapter on Sales Management, good advertising and good strong sales letters will in many cases do the work of a salesman, even to the closing.

Their cooperative value surely can not be overlooked.

The salesman is entitled to the benefit of the contact with the trade of those in authority, who are inclined to be cold and indifferent toward the trade, letting the salesman do all of the handshaking, all of the associating, all of the negotiating, all of the adjusting, all of the thanking. Even a letter from the president may be advisable at times.

In another chapter we shall go into the subjects which have already been mentioned, and furthermore into such others as quotas, bonuses, special training, the benefit of all of which the salesman should have if the manufacturer is to obtain the most satisfactory results.

ANALYZING THE SALESMAN

The salesman, being the personal representative of the manufacturer or jobber or retailer, is the man on the ground constantly in touch with the customers, carrying to them and making known the goods or offer, the service, policy, character,—everything. He must make a good impression. If he makes a bad one, the company back of him makes a bad one, because it is judged by the salesmen it keeps. Let us

see what combination of things we must look for in the good salesman; in the better salesman, let us say.

PERSONALITY

Personality comprises all of the positive and negative qualities of the salesman; all of his good and bad points. These positive qualities develop the radiating force which exerts power over others, making them give attention and listen and think and do. It is said to be the greatest power in influencing others, and is measured by the degree of good personal appearance, education, manner, expression, character, and other qualities possessed by the individual. It can be developed, both body and mind being involved in this development. Developing the body, training the mind, correcting the manner, beautifying the expression, strengthening the character,—all of these improve the personality. The physique, the head, eye, features, voice, carriage, appearance, demeanor, language, judgment, reasoning power, courage, faith, memory, tact, perseverance, initiative, energy, all of these are details of personality. The big man will have many of these qualities well developed; the little fellow will have a fewer number not so well developed.

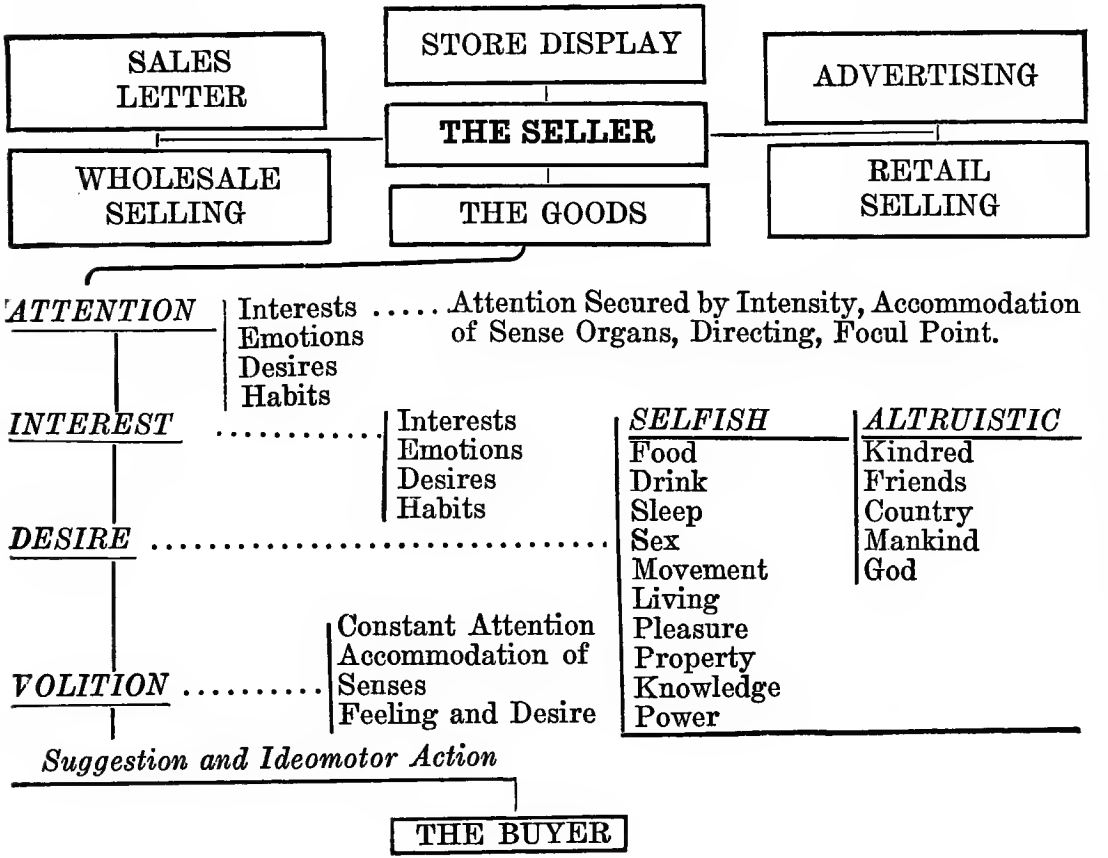

DIAGRAM OF THE SALES PROCESS

Give me the salesman who is honest, who has good carriage, self-respect, confidence, grace. Let him have a good handshake, a quiet natural smile with depth of character behind it. Let his manner be easy; let him have poise, be cool and calm, and latently forceful. Let him use good English, articulate well and pronounce properly. Let there be magnetism in his well-modulated voice,—expression, and sympathy, and sincerity. He must know human nature. He must have forceful yet not violent gesture, with enthusiasm that is deep and radiating and not boisterous, and with persistence that has the real sticking quality yet does not become a bore. If this is the description of a standard and not a man, the nearer we get to it, the better salesmen we shall be. Every organization wants men equipped to go higher. The salesman who has a high standard for his goal will be one of those first to receive the call to executive work.

LOOK WELL AS WE SELL

Of the details of personality which we have mentioned, some appeal to the eye, others to the ear, and still others generally to the senses. Personal appearance appeals to the eye. It is

through the eye that the first impression is made, and some men are very far-sighted when salesmen are waiting for an interview. Appearance is therefore very important. In its broadest sense it comprehends cleanliness, dress and manner, the latter being closely allied with expression, carriage, walk, poise, cheerfulness, politeness, enthusiasm, sincerity, determination and self-control. If one has poise this surely benefits the general appearance. Similarly if one is cheerful this benefits the appearance by making it more pleasing; and so with politeness, and enthusiasm, and self-control.

CLEAN PHYSICALLY AND MENTALLY

Even though it may seem unnecessary to many of us, before writing about any other characteristic of the salesman we must dwell on the extreme importance of keeping clean. If we have not the ambition and energy to keep clean we are unfit even to consider the subject of selling. Let us by all means keep clean. The human body well taken care of is an object of admiration, but neglected becomes a thing of disgust. Our bathing frequently and thoroughly can not be neglected. The head and hair should

be looked after, and the ears and teeth and nails. These are a perfect mirror of general cleanliness. If it is important to keep the body clean it is of greater importance to look after the mind,—the directing force in this work of selling. Let us not fill it with the vile and filthy instead of the good and wholesome and noble.

CLOTHES AND THE MAN

Clothing does have its place in making the man or woman. Clothes are fairly true advertisements of personality, and should be well selected. Over-dressing is as faulty as under-dressing or dressing poorly. Wearing good, sensible, well-fitting clothes and keeping them in good condition is an indication of refined taste, of value to the salesman. There is nothing like cleanliness and proper dress to inspire confidence and agreeableness. Chesterfield puts it quite strongly but truly when he says: "I would rather have a young fellow too much than too little dressed; the excess on that side will wear off with a little age and reflection; but if he is negligent at twenty, he will be a sloven at forty, and worse at fifty." A man came into my office a short time ago soliciting advertising. He was decorated with rings, and

fobs, a heavy chain, a suit of large, loud checkered pattern, and spats. He did not get an order for advertising. When we have good-looking, sensibly made clothes we feel like real men. When we are over-dressed, or under-dressed, or shabbily dressed, we feel uneasy, self-conscious, cheap and dissatisfied with ourselves. We are distracted and can not get down to business.

MANNER NOT MANNERISMS

If the salesman has poise of bearing, good graceful carriage full of dignity and sincerity, and a handshake that is sincere and electric, these are the deep and silent qualities of manner. If he has the effervescing, radiating qualities of cheerfulness, politeness, courtesy and enthusiasm he has the life-giving qualities of manner; the qualities of the "southern exposure"; each a sunbeam of personality. Cheerfulness and enthusiasm are contagious. They help to put one in the receptive mood for listening and buying. If the salesman has a genuinely cheerful smile you smile with him. If he is really courteous and polite, you are courteous and polite; you can not ignore him. Edmund Burke says:

"Manners are more important than laws. Upon them in a great measure the law depends. The law touches us but here and there, and now and then. Manners are apt to vex or sooth, corrupt or purify, exalt or debase, barbarize or refine us, by a constant, steady, uniform insensible operation like that of the air we breathe....according to their quality they aid morals; they supply them or they totally destroy them."

It is important to study ourselves and overcome any detracting mannerisms. The salesman who is loud and boisterous makes a bad impression. His manner should be refined and subdued. He must overcome nervousness, keep his head, face and eyes settled, and his hands and feet at ease. Sniffing, hacking and coughing must be avoided. They detract; they are annoying if not repulsive.

SINCERITY

Another characteristic which is closely associated with appearance is sincerity. A selling talk will have no force without sincerity. We should have the appearance of being in reality what we are professing to be; of intending precisely what we say or what we appear to intend. Sincerity is honesty in our actions or preten-

sions. It is saying what we mean, and meaning what we say. The appearance of insincerity creates doubt, lack of confidence, suspicion, any one of which conditions is sufficient to prevent a sale.

OTHER DETAILS AND REQUIREMENTS

In what is regarded as the order of their importance many other details of personality and practises or requirements of the successful salesman should be mentioned here. Character, knowledge of goods, knowledge of the buyer, such qualities as resourcefulness, originality, persistence, thoroughness, tact, the use of English and memory are indispensable. No two minds will agree on the order of importance. The order in which they are mentioned here seems to be reasonably logical.

BRAINS AND CHARACTER RULE THE WORLD

This is Wendell Phillip's expression. In selling we shall put character first, and particularly in personal selling. We are always looking for character. We must measure up to a certain standard to be somebody. Character is moral force; a union of the qualities which

distinguish a person. It must be above reproach in the salesman or he is to have a cold reception. It must have depth and quality. How does it differ from personality? It may be good, yet the personality may not be striking or forceful. It may be bad and yet the personality may be scintillating with vim and magnetism. Personality is the character plus the other qualities which we manifest outwardly, such as appearance, carriage, voice and language. Character is like the trunk of the tree without the limbs and leaves, and personality is the tree with all its decoration. Developing character involves a close and constant examination of the inner self with respect to what is right and wrong; supplying the mind with what is good,—lofty thoughts and high ideals, and training the will to mold these thoughts and ideals into good clean habits. The man of good character has courage and will power; he is ambitious yet patient, sincere and firm yet kind, modest and unpretentious.

HONESTY

If we are to minimize litigation and create the greatest stability in business we must have honesty. That a man's word is as good as his

bond should be the rule rather than the exception. The purpose of a written agreement should be to serve as a permanent record of an honest understanding, rather than as a means of protection against dishonesty. When the business man lives up to his obligations in this respect, greater confidence will be inspired in the business world. Credit will be extended to the very limit. Business will be transacted without suspicion, without misrepresentation, without one taking advantage of another. There will be no opportunity for the salesman who is tricky. There will be no partiality; no subterfuge; no unfair competition. Good value will be received in every case. The salesman must be a factor in maintaining such a condition. He can not afford to do otherwise since dishonesty may make his first sale but will prevent his making another, and the law of diminishing returns will work overtime against him. Honesty—the best policy—is a good business proposition. Successful selling is largely a matter of pleasing and we can not please unless we are honest.

KNOWING WHAT WE SELL

Assuming that the salesman has a reasonable degree of intelligence, next to character and

honesty it seems natural to place knowledge of the goods or proposition which one is to sell. If a salesman expects to interest any one in the goods or articles which he has to sell he should know all about them. Knowledge of every detail of manufacture from gathering the raw material to turning out the finished product should be at his command. The story of the manufacture of almost any article is interesting to one who does not know it. The designer or engineer has a very good reason for every piece or part and the arrangement thereof in his automobile or tractor. If we are selling leather we can get volumes of valuable and interesting information on Morocco, pigskin, lizard, alligator, walrus and other kinds. We should know their differences, the classification of leather, preparation for tannage and tannage itself. We should know chamoising, currying or dressing, dyeing, facts about quality, substitutes and their preparation,—everything. If it is cement or plaster we should know it from the time it leaves the quarry in the form of rock until it is carried along the belt into the railroad box car. It is important to know what points in the article will please the customer; what the customer usually looks for in the goods. If it is a traveling bag the customer

will want to know that it opens wide, keeps its shape by having wide gussets; that the clasp opens and closes easily yet will not burst open, that it has good leather, good lining, is well made and will wear well, that it has good inside pockets and is in every way suitable to the use intended.

Knowing the details of the articles of one's competitors is almost as important as knowing the details of one's own proposition. Every buyer is a man of comparison. In his examination he has in mind some other similar article that he has seen. Knowing the competitors' products gives the salesman the opportunity to prevent argument by anticipating the objections of the buyer; raising his objections for him and answering them. I, as a salesman, should know that the cost of my insurance is less per thousand than that of my competitors for the same protection. If the car which I am demonstrating will climb the Rockies without overheating better than other cars will do it, I should know this. If the tractor which I am demonstrating will do certain necessary work better and at less expense than other tractors will do it, I should be aware of this.

Mr. Opdycke in (*Shaw's*) *Advertising and Selling Practice* has this to say:

"Knowing the goods is a heavy requirement. It implies that the student must be a student of production and of all the processes brought to bear upon the raw materials until they become the finished article of sale. If it is a piece of wool, he should know it from the sheep ranch to the merchant's display cabinet. More than that he must know what reputation a certain brand of woolens has made for itself; he must know the relation of weights and measures to qualities; he must know how to display even an ugly garment in an attractive way. There are salesmen who can hold a piece of silk over their arms, draping and plaiting it with magic swiftness, in such a way as to display all of the possibilities of shading and flexibility of texture, and they can accompany the demonstration with an intelligent and interesting talk about the commodity."

KNOW YOUR MAN

Do you know men and how to deal with them? Business brings us constantly in contact with men, negotiating, describing, appealing, getting them to reason our way. Every hour of the day we are meeting them, taking up the details of business in which there is mutual interest. Living and doing business necessitates our being constantly in touch with one another. How very important therefore that we know men. By being thrown into contact with them we are

bound to learn much about them. We can learn much also by a study of the writings of those who have made a scientific study of man, such as the psychologist and the character reader. In a later chapter on The Buyer much will be said about man in general and how to deal with him in business.

THREE CONSTRUCTIVE QUALITIES

Next in the order of importance to the salesman we might mention the qualities of resourcefulness, originality and initiative. These qualities well developed may place the salesman in a class by himself. The resourceful salesman has his situation so well in hand that every means to which he may resort in order to meet a condition, is at his command. All of the circumstances of which he may take advantage are known to him, because he has searched, and studied and found them. If he is original he is able to take the information he has gathered and accomplish things in new ways, different from the ordinary. This gives his work distinction and individuality. It separates it and the salesman from all of the other work and all of the other men who do things in the usual way. Initiative gives him the driving force to go

ahead and do without having to be led. It directs him to act without depending too much on the instructions of superiors. Instead of depending on his superiors, they are depending with full confidence on him to meet situations as they come up. Resourcefulness gathers the knowledge of the thing to do and the means of doing it; originality causes it to be done in a new way; and initiative directs the doing on one's own responsibility. The man who works like a machine doing only the things he is told to do, and as he is told to do them, is well qualified in this way to be a locomotive engineer, not a salesman. He should be working by train order.

KEEP ON "POUNDING"

The qualities of persistence and determination require unusual exercise of the will. Tempered with good judgment and tact they are the qualities which intensify our personal selling to the most effective degree. They make the sale if it is possible to make it. A salesman may have a good number of the other qualities of a successful salesman, but without persistence he will fail. He will give up too soon. With persistence he will win. This is the quality which makes one try again, and again, and

again, and then once more. Can any other quality worth more to the salesman be mentioned?

DOING ALL AND DOING IT WELL

Thoroughness! Do we grasp its full meaning? Doing all, everything there is to be done, and doing it well,—that is thoroughness. Many men even in business have never been able to grasp the meaning and value of thoroughness. They have not realized the importance of getting to the depths of the problem before them. All of the facts have not been gathered carefully. Decision was made on findings and evidence that were uncertain, involving too much guessing. The importance of looking after details was overlooked. Matters which were started were not properly followed up. If we will be thorough we must think carefully; learn first what information is needed and obtain it; what is to be done and do it. If a salesman is to make an adjustment or an investigation, his work must be complete. His solicitation should be thorough, selling every dollar's worth possible and yet not overselling. His prospective business should be kept well in mind and carefully followed up. Thoroughness is partic-

ularly important to the salesman whose visits are infrequent. Dealers have a custom of using, sometimes for years, a certain brand, advertising and promoting it alone. They become attached to the brand and the company which sells it. To convert them to the use of another brand requires unusual ability. There may be no advantage in price or quality. These situations require, with patience and perseverance,—thoroughness. Much must be accomplished during the call, and much thought must be given each case between infrequent calls. Knowing the attitude of every customer, how favorable or unfavorable he may be, and of every prospect, is most important. Taking advantage of the knowledge which we are able to gather with study, keeping the office advised for proper cooperation, and carefully following up each case, is thoroughness.

Very good results can be obtained by writing letters to those who have made promises or are apt to make them, and to those who for other reasons seem to be good material to work on. The salesman can do this best by carrying a folding typewriter and a supply of company stationery. Carefully kept memoranda will enable the salesman to determine when to write and what to say. Well written letters of this

kind are effective. I have seen them secure new customers, and help secure many others. Buyers appreciate unusual effort and energy properly directed. Among salesmen, letter-writing of this kind is unusual and original and therefore appealing.

GOOD JUDGMENT

In the group of requisite qualities, judgment would seem to come next in importance. According to the dictionary, it is the faculty of judging or deciding; the mental power concerned in the formation of a decision; hence the faculty of deciding correctly. Good judgment—the master quality of the successful business man! Great because it comprises so much. It requires knowledge; knowledge of goods, of things human, of the details of making the sale, of the point of view of the buyer, of everything associated with the thing to be judged. This knowledge must be as complete and true and relevant as the evidence of our courts, and the judgment as carefully passed. There is no jumping at conclusions, no guessing. There are thoroughness, examination from every angle, careful weighing, careful selecting and eliminating, true understanding.

Every manufacturer will have respect for the salesman who has good judgment. This salesman's recommendations will carry weight. The business day is a day of judging, of deciding what is the thing to do in the many different cases presenting themselves hour after hour. What a valuable faculty to develop!

TALENT IS SOMETHING, TACT IS EVERYTHING

Following judgment we might well mention tact as next in importance among the salesman's qualities. W. P. Sargill has said that "talent is serious, sober, grave, and respectable; tact is all that and more too. It is not a sixth sense, but is the life of all the five. It is the open eye, the quick ear, the judging taste, the keen smell and the lively touch; it is the interpreter of all riddles, the surmounter of all difficulties, the remover of all obstacles." It is the ability of saying and doing exactly the right thing at the right time. Like the governor on an engine it keeps the salesman going at the right speed, warns him when he is going too far, keeps him from saying and doing the thing that may do him harm. When a customer is busy, tact says, "Wait!" When his frame of mind is not favorable it finds the circumventing way. When

the tendency to approbation is pronounced it prompts him to pursue this tendency. If benevolence, or cautiousness, or conscientiousness should be appealed to tact comes into play. If the buyer is irritable tact finds the way to make him smile. If he is bluffing it will bring him without offense to sincerity. It works well over the stubborn and the impolite, over the brag or the know-it-all. It is an antidote for maliciousness and pessimism and suspicion.

WELL CHOSEN ENGLISH

Of the many gifts which the salesman may possess, or qualities he may develop, the most convincing and deep reaching is that of being able to use good, pure, forceful English and convey it in a well-trained voice, with perfect articulation. Good English fits in everywhere, appeals to every one, cloaks a multitude of negative qualities, is entertaining and pleasing, and commands respect and interest. With it the orator, and the writer, and even the advertiser, sway millions. A lifetime might be devoted to this subject alone; hence the necessity of giving it thorough consideration. Any salesman can accomplish much toward perfecting his English by proper study and practise.

By all means let the English be good enough to convey our proposition to those whom we expect to sell, in clear, forceful and pleasing language. The character of the trade solicited may make this element of much greater importance in the list of the salesman's qualities than it is given here.

MEMORY IS POWER

One of our early writers spoke of memory as the "cabinet of the imagination, the treasury of reason, the registry of conscience, and the council chamber of thought."

The mind has both a conscious and subconscious field. Back in the subconscious field we store every idea, sensation, impression or act to be recalled at some future time on account of desire, association, need, distress or other possible cause. In our study of the buyer in the next chapter we shall learn the importance of the association of ideas and of the will in memory; of proper attention, etc. The laws of memory and the methods of improving it will be taken up at that time.

Remembering the name should be cultivated by the salesman. The ability to call a man's name whenever and wherever we may see him

is appreciated and has a good effect. The effect is spoiled, however, unless we give the name correctly. It is important to register the first impression of the name correctly by getting, if possible, the spelling and pronunciation; repeating the name and associating it with the person while we talk with him and after we leave him. Much of the work of memory can be taken care of by carefully kept memoranda, yet innumerable occasions will present themselves when the salesman will be required to exercise memory when records and memoranda are not available or when they can not be resorted to.

I have found it difficult to have salesmen realize the importance of the proper pronunciation and spelling of a name. Salesmen's reports should be the most dependable records of the office. The sales manager will not easily forget the embarrassing experience in sending out correspondence to "Dear Mr. Lourdes" instead of "Mr. Luers." What might have otherwise amounted to a good personal letter is now made flat and weak because the name is incorrectly given. And if the given name is "John," let's have it "John" on the reports and not "James,"—a detail just as important.

IMAGINATION—THE PICTURING POWER OF THE MIND—THE GREAT CONSTRUCTIVE FACTOR

Before an artist can succeed in crystallizing a great picture on the canvas, his mind must work out vividly every detail of form and arrangement. Before the inventor can succeed, he must first picture mentally his machine and its parts, then draw them, and finally prepare his model. A vivid imagination is a great constructive power. It helps to plan the sales policy; brings before the mind the situation with which the salesman and sales manager must contend; the territory, people, article or goods and other elements. It enables the salesman to place himself in the position of the buyer, to gain his point of view. We shall find later how we can imagine sounds, smells, tastes and other sensations without the aid of external sensory stimuli. We can see things entirely through the mind's eye. A well-trained and well-controlled imagination is very valuable to the salesman.

KINDLY CONSIDERATION

Thoughtful, intelligent people have no respect for the malicious critic, he who tramples on the

opinions and beliefs of others. The political, religious and general beliefs and opinions of others should always be respected. Criticism of others on account of their appearance or peculiarities should be spared. These little poisoned darts of comment may strike the vital spot of one for whom they were least intended. Let us try to carry only favorable criticism as we sell, even—or particularly—in references to our competitors. If a special occasion should call for comment let it be fair and respectful. Let these matters be treated delicately. We shall help to make the world a better world to live in if we always have due respect for the other fellow. If his religion is his consolation let him worship as he pleases. Give him a contribution toward his church even though you do not believe as he believes.

WASTEFULNESS ONE OF OUR WEAKEST SPOTS

Mr. Edison adds to this, "that the time has come when any man who lays claim to business ability will have to keep the question of waste before him constantly." We are watching our credits and collections, and our buying. We must watch for waste in our selling. It must be minimized. We can not afford to take or-

ders at any cost, looking for tonnage only. The expense account must be kept in mind. How much is it costing us to get this business? Is it going to help dividends? Are we getting it as economically as possible? Is our route sheet planned to secure the minimum of expense? Am I getting the most out of my limited time? Can I not get along without all of these cigars and all of this entertainment? Am I spending the company's money as I would spend my own? These are some of the questions which we must decide for ourselves. Restraint and economy are excellent practises, very highly regarded by employers.

SUMMARY OF QUALIFICATIONS

Charles Lindgren in *The New Salesmanship* says: "With intellect and emotion and fair activity we have an excellent salesman. The salesman well balanced in these faculties is ideal. He can change from mood to mood, emotion to emotion, thought to thought, with the facility of a moving picture. One moment he is grave, the next gay; another moment he is convincingly firm, the next moment diplomatically yielding. Another moment he is outpouring a perfect torrent of argument, the next he is

so persuasively soft and low that he thrills his hearers with a pleasurable emotion"—a description which may seem a little idealistic, yet undoubtedly is true in a general way to actuality.

Mr. Nathaniel Fowler in *Practical Salesmanship* summarizes the good salesman's qualities in this way: "The proficient salesman knows his goods, has the ability to describe and talk, has a general knowledge of business principles, has a working familiarity with the methods of his competitors, has the ability to talk something besides shop, and the ability to diagnose a customer, has a good disposition and has the ability to please the customer as well as the concern."

I would add that he must be a thinker, a right thinker, like the boy who told Mr. James J. Hill that his order was wrong. The thinker is the constructive man, the one who sets up new standards, finds new ways of doing things. He is the inventor, the lawmaker and the successful business man. As a well-known Chicago lumberman said before a salesman's convention of the Southern Pine Association in St. Louis, "If he (the salesman) is going to exchange a standard commodity for cash, intelligently and at a living profit, he will have to think to do it,

and he must think in capitals, for to-day industry and perseverance, admirable qualifications as they are, are quite as likely to lead their possessor to the poor-house as to success. He must put his thinking machine in high gear and keep it there all the time to keep pace with his competitor."

Unless the salesman thinks, his collection of good qualities will be as useless to him as a factory without a manager. The mind must be constantly in action, thinking, comparing, deciding, reasoning,—carefully and correctly. Proper thinking will increase the salesman's market value in the business world.

"You want success," quotes Doctor Blackford from some unknown but wise author. "Are you willing to pay for it? How much discouragement can you stand? How much bruising can you take? How long can you hang on in the face of obstacles? Have you the grit to try to do what others have failed to do? Have you the nerve to attempt things that the average man would never dream of tackling? Can you cut out luxuries? Can you do without things that others consider necessities? Can you go up against skepticism, ridicule, friendly advice to quit, without flinching? Can you keep your mind on the single object you are pursu-

ing, resisting all temptations to divide your attention? Have you the patience to plan all of the work you attempt; the energy to wade through masses of detail; the accuracy to overlook no point, however small, in planning or executing? Are you strong on the finish as well as at the start?" Vital questions, these, to one who seeks success in any line.

If the man with a drab personality is making good and another with a brighter and better personality is failing, there is a reason. The strong qualities of the one far outweigh the weak. The salesman who seems to measure up to requirements but fails in his work is weak in some vital part. He may not have the perseverance. Possibly he is not well enough acquainted. He may be obnoxious for want of patience. He may lack good judgment or tact. Some important detail of personality is negative or wanting. These little details of personality are like the jewels in a pin. They must all be there in their place or a negative effect is produced. If one little jewel is gone its absence reflects on all of the others. So it is with the salesman, he is at his best when all the positive qualities are present acting in harmony. His mind then calls into play each of these qualities as it is needed. If it is cheerfulness, out

goes the warm and vigorous hand for the handshake, and the natural and friendly smile. If it is the exercise of judgment, it is a good and dependable judgment. If it is determination, it is the calm and cool determination which does not antagonize. A carefully thinking mind is directing every move, watching, questioning, driving one point and then another, using all of the power of the personality to get results. Knowledge, personality and action are the trinity that means success in selling.

CHAPTER II

THE BUYER

The buyer is a very important factor in the business world. According to the support which it obtains from the buyer, business stands or falls. Collectively he regulates the markets of the world, representing the universe of consumers. The individual, family, corporation, special group, farmer, business or professional man, college man, the girl graduate or bride,—man, woman and child in every class are represented in the buyer. Every one is at some time a buyer, for if one will live one must buy.

Stability in business demands that the relation between seller and buyer be of mutual advantage. The resulting constant demand from the buyer offers an attractive field for the seller which results in competition, very keen at times, always keen enough to require knowledge and experience of the highest degree in order to survive in its wake. Since the buyer is the channel through which the dealer must work; since the volume of sales, frequency of

turnover, and consequent amount of profit depend on him, it can be seen how important is the study of the buyer. If the seller is to obtain his share of the business of a community he must be sufficiently acquainted with the buyer to know how to appeal and persuade to the point of action.

How shall we study the buyer? When I was learning to drive a car an instructor was sent to give me the elementary ideas of operation. At first I did not get along very well because the instructor worked something like this: "Push down on your left. Now release your left and down a little on your right.—Push that lever forward and press on your right.—Push this and pull that, and turn this and turn that."

"Now wait a minute," I said to this fellow. "Just let me know a little of what I am doing here. What is this lever that I am pushing, and what is that pedal and that rod, and just how do they work?" We rested for a while and he explained the gears and their different positions, the accelerator and its effect on the engine, the release clutch, the differential, transmission, spark and gasoline feed and their functions. After that I learned to drive because I understood the reason for each move-

ment and the effect it had on the operation of the car.

We sales managers and salesmen, and others interested in the different branches of selling, have the problem of getting the buyer to work as we would have him. We have a lever to pull here and an accelerator to push there. We have the problem of persuasion and of effecting volition or action; of getting him to buy our goods. Are we not much like a man learning to drive an automobile? Will we not handle this driving, or leading or persuading or action-producing proposition much better if we know the nature of the buyer's engine, his different control levers, his carburetor, his transmission and differential?

Man physically and mentally is constituted the same, wherever he may live in the civilized world. He has the same kind of body, the same kind of nervous system, the same senses, instincts, feeling, in general the same desires, habits, interests and emotions. He has a mind endowed with powers of perception, memory, imagination, reasoning and willing. Since these characteristics are common to man, let us for the sake of simplicity select in our mind an individual buyer and examine him. What do we find? We find that the body of the buyer

is the instrument through which the mind exercises its functions. Like a very complex and intercommunicating telephone arrangement is the nervous system with its central office the brain at the top. The brain is a mass of white matter with gray embedded in it. Covering its folds and fissures is the very highly sensitive cortex, below which, and embedded in the white is the gray matter which constitutes the subcortical centers, or junction-like apparatus of this telephone arrangement, connected by nerve fibers with the cortex. Another important part of this arrangement is the trunk line called the spinal column which is connected also by nerve fibers with the brain and with the muscles and surface of the body at myriads of points.

THE SENSES AND THE NERVOUS SYSTEM

Directly connected with the nervous system is that wonderful camera, the eye, which takes pictures automatically of objects which are presented to it. The samples which we carry, the automobile which we are demonstrating, the goods which are on display in the store or window, are all photographed by the eye when they come within its range. The salesman himself and his movements and appearance are pic-

tured by the eye and through it make impressions favorable or unfavorable. Connected also with this nervous system is the ear whose drum is thrown into vibration by different sound waves which produce a series of movements resulting in excitement of the auditory nerve. The words of the salesman, the ring of metal in an article, the tone of an instrument, the sound of a motor, all come to the buyer through the sense of hearing. And so the nose with its olfactory nerve receives the sensations of smell and, with the aid of taste and touch, interprets them for the buyer. Many an article such as drugs, teas, coffees, perfumes, fruits, which have their characteristic odor, is purchased with the aid of this convenient sense. The power of touch reaches to every part of the body's surface. It too is a powerful aid to the buyer in determining the character and quality of goods or articles which he examines. Taste, centered in the tongue, is assisted in its work by smell and touch, the smell of the onion having much to do with its taste. Certain other sources of sensation have their peculiar nature. The cutaneous sense, as the name indicates, is centered in the skin where three distinct sensations are found, those of pressure, heat and cold, and with them certain others which are re-

lated to the organic sensations mentioned later. The muscular sense enables the buyer to determine the position of his body or its members; to know when he is walking or pushing, moving the arm or head, lying, standing or riding. Finally the buyer has the sense which enables him to determine the states or conditions of the bodily organism itself; tells him of pain, over-exertion, hunger, thirst, headache, nausea, and other conditions. The general tone of feeling of the buyer depends on them.

Here in the senses, you see, we have the very sources of action in the buyer. He must see an article, or hear it described, or taste it, or touch it, or he must have the muscular experience of riding in it, perhaps, like in the automobile. Something takes place right here in the senses, in one or more of them, to start the buyer on the way to a purchase. And the more of these avenues to the brain we use in appealing to the buyer, the greater the cumulative effect. Watch the man who examines wine. He is charmed with its color; the taste he can not forget; the smell brings him to the vineyards of France. His impression of this wine has come through three different reinforcing senses each supporting the other, the combined effect of which is the greatest possible.

MUSCULAR RESPONSE

Muscular response is an important endowment of the buyer on which success in selling largely depends. The nervous system provides a very flexible and well-organized scheme of muscular response, connecting the sense organs with particular muscles giving ready and accurate communication. If the buyer is conscious of action both the subcortical centers and the cortex itself are involved. An illustration, the presentation of an object of sale, or an oral statement produces a muscular response of some kind when presented to the organs of sight, or hearing, touch or smell. Some of this response is controlled by the will and some results from physical and mental habit. What does this mean? It means that every one does certain things after deliberation and certain other things without thinking, as we say. A suggestion of some kind makes one act before one has considered the consequences. If the results are favorable we never hear anything of it. If the step has resulted unfavorably the explanation is: "I did it before I realized what I was doing." Having an article that we know will please, will fill a need or want, it is good salesmanship to take advantage of this tendency

to act before thinking, by means of suggestion, the shortest route to this so called ideomotor action. Many people can not think without effort and others will not. Good salesmanship does the thinking for them in the simplest of language, the suggestion in word, in picture, in the arrangement of the article itself as in display, or otherwise.

MENTAL EQUIPMENT

Thus far we have been dealing with what the psychologists designate as the buyer's psychophysical equipment because it involves largely his physical organism which is the basis of all his mental operation. In addition to this the buyer is supplied with certain mental equipment which is of the utmost importance in acquiring knowledge and in governing his many and various mental processes. First, and important from the very beginning to the end of the mental operation of making the sale, is *attention.* It must be obtained and held; held constantly until the buyer finally wills to purchase. There is *sensation* coming over the different sense organs, to a large extent the raw material of the thinking process. Then there is the power of recognizing and interpreting

what we see or hear or smell,—*perception;* the consciousness of objects presented to the senses. We perceive an automobile, or cash register, or a bolt of silk, or a sack of sugar because in our past experience we have come to know them as such.

The next step after perception in which the buyer acquires knowledge is through the *imagination.* All of the conscious processes of the buyer have to some extent an influence in the determination of the activities of his later life. Imagination is the consciousness of objects which are not presented to the senses; seen in the mind's eye only. The buyer can imagine sounds, and smells, tastes and different kinds of touch without the aid of any exteral stimulus. Yet imagination must have something internal to work on, this something being all of the objects that have previously been perceived and placed back in the chamber of memory. The buyer could not remember a tractor if he had never seen or heard one described. It is these images, therefore, that give the buyer the mental mechanism for looking forward or backward in the mind. The images remain for future use in acquiring knowledge. They could not remain were it not for memory.

Buying is a part of the activities of the later

life of every individual. It is therefore a part of the work of good salesmanship to see that the ground work of these activities is properly established in the buyer, in personal selling, letters, advertising and display. More specifically, it is necessary that the salesman or advertiser establish in the mind of the person whom he solicits, certain images or mental pictures regarding his company and his goods and their uses, which images will then become the content of the buyer's thought when later occasion demands recall. Successful salesmanship really takes root here in the buyer's memory and imagination. The cumulative value of all selling, personal or advertising, depends on the number and character and vividness of these mental pictures stored up in the buyer's mind by the skilful salesman or advertising man.

MEMORY AND ITS LAWS

Memory plays a little game all its own. Let us see how its laws work generally and perhaps we can reverse the situation and take advantage of these laws in making our impressions or mental pictures on the buyer's mind so that they will be lasting; so that when he thinks of

cereal, for example, he will have an immediate and vivid mental image of some definite brand or trade-mark. There can be no cumulative value to salesmanship; no establishment of good will in business without the aid of memory. Let us examine its important laws.

Many ideas enter the mind singly or alone; many others enter in groups, simultaneously or one shortly after the other, connected or related as though the impression they make is recorded on the same sensitive surface, the cortex of the brain, as is the single impression. Some impressions reach the brain through the eye, some through the ear, some through the other senses, or through more than one of the senses at the same time. This results in what is called association of ideas, so closely interwoven that the representing of any one idea tends to bring up all. This association therefore does the work of aiding in recall; makes it easier;—gives it a much wider field for stimulation. Trying to recall but a single impression or idea as compared with an associated idea, is like trying to fish with a single hook instead of a net.

The will is largely instrumental in the development of memory, attending to the making of a well-formed impression, getting it clear and

distinctly imprinted, seeing that proper attention is given; all of which divulges the secret of memory. Attention imprints on the brain the size, color, shape, peculiarities and other details. The will directs the making of the impression by seeing that the stimuli come from every possible medium; through the eye, ear, nose,—bringing reinforcement wherever possible. The will sees to it that the laws which govern memory are carefully followed. If it is found most satisfactory to remember by sounds, the will provides a good supply of sound phantoms for use. If memory is made most effective through sight, then well-framed and vivid pictures are imprinted on the brain with every idea to be remembered. If it is a person, the face and form and peculiarities will be carefully absorbed. The eye will be worked to full advantage because it is through this organ that the greater number of impressions are received.

The seller can improve the memory of impressions he registers on the buyer, by making the buyer's eye an observing eye that will grasp details. By suggestion, the ear will be made to detect the finest differences of tone. Similarly the taste will be trained to the delicacy of that of the tea-taster, and the touch to that of the

blind. It is a law of memory that training and development place one's recording instruments in condition for doing a good job of mental engraving. The buyer is not interested in training his senses to assist in retaining the impressions of the seller's goods. The seller can, however, by subtle suggestion, produce to an advantageous degree the desired effect.

Memory can be strengthened by conscious revival of an impression; repeating it mentally or aloud or seeing or hearing it repeated, thinking about it from time to time. Another device which aids memory is rhyme, often demonstrated in the use of jingles. Another device is abbreviation. Nonsense syllables or words composed of the first letters of names that we wish to remember especially in their order, are effective; G-W-C-S-C-O-C representing the names, Glenarm, Welton, California, etc. Knowing the meaning of what is to be remembered is important. Many people have a good memory of numbers. Dates and numbers, such as telephone numbers, can be associated with certain things to good advantage.

In selling, therefore, let us get away from the single idea like the monotonous, stereotyped, never-changed advertisement for example, and associate in its stead ideas that will give the

strength of unionism to the suggestions which we present to the buyer for his memory chamber. Every company has its material for this purpose. It may prove to be age and reliability reflected in years of service. It may be size in some of its forms, magnitude of production or number of employees or plants. It may be unusual scientific methods of manufacture. It may be immaculate cleanliness, unusual transportation facilities, courtesy, or it may be preferably a combination of these or other qualities that lend themselves very effectively for valuable, and lasting, and recall-producing associations. The salesman and sales manager must work together to establish these associations. Everything that the salesman says or does should make a favorable impression. Everything that he represents regarding his company and its product, every service that he performs or has his company perform should be done in such a way as to have its good effect in the cumulative results to be produced.

I am trying to establish the name of my company in this territory as standing for the best of everything. I want the buyer to have a high regard for its name and everything associated with it. I have therefore insisted on having good offices, well located and well furnished.

The stationery which my company uses is of good quality and appearance; and I want the material that goes into its letters to reflect the best when they reach the buyer. I want salesmen with personality. I want the very highest quality in my product. I want my service to mean something special and distinctive to the buyer. I want him to have a high regard for this company's cooperation. Above all I want him to feel that he is doing business with a company that is honest, having his interests at heart as well; and that he can depend on it at all times to give him the very best of everything possible. All of these things I want reflected by my salesmen. Striving for the best in every detail is bound to produce in the buyer associations that will be of permanent value, growing stronger as the years go by.

Again in selling we will try to get the will of the buyer in action in our behalf. If the will is instrumental in the development of memory let us have it exercising in our favor, interested, cooperating, boosting our goods, and feeling that the return to him, the buyer, is worth while. With a favorable will impressions engrave themselves the deeper, and the company concerned and its product become the monarch of the selling field. Every little friendly word or

act will make the impression stronger. And the value of repetition should not be forgotten, presenting each time in different dress if possible, and making the appeal through all of the avenues to the brain, the different senses. When sales are not made on the first call, the good will produced is based on memory. Something must be done to make the buyer remember the salesman, his goods and his company; the impression must be clear and favorable, becoming stronger and more fixed with each visit or advertisement.

COORDINATION OF KNOWLEDGE

Through what is called conception, the buyer is able to recognize and employ the meaning of things that are presented to the senses. Without this ability perception would be useless, and memory would be only confused; the buyer could not recognize the meaning of what is presented and remembered. And so the imagination would be a failure without this ability to give meaning to the images that fill the mind. Conception brings together the common points of our many experiences and consolidates or molds them into ideas, which become the mileposts in our thinking, to do the work of hun-

dreds of other ideas. It is the classification of percepts and images into what are called concepts. We form concepts of buyers, goods, color, sound, position, time, good and bad, price and quality. We are comprising in the concept the qualities common to all. The concept is the buyer's comprehension of goods from all of the goods he has ever had presented to his mind; of one tractor from all of the various tractors; of one color from all of the hundred and fifty different shades he has seen in the past. The buyer is constantly forming concepts; he is forming new ones or enlarging or enriching the old. The successful salesman must keep pace with him by enlarging and enriching the concepts he has of the things that he sells. His concept of motors must be broad, enriched by wide experience and knowledge of motors of all kinds. Concepts which remain at a standstill become petrified; bring the buyer and salesman into narrow paths of thought and work, and make each inflexible and firm in his "old-school" ways.

THE PROCESS OF REASONING

Although there is an elementary form of reasoning in all of the buyer's mental processes

there is another higher and more complex form of reasoning which gradually unfolds to him and others what he has in his mind. This complexity, reasoning, involves perception, imagination, memory and conception all at work thinking out problems of sale or purchase. The process of reasoning becomes organized and simplified by mental habit. For example, the problem of ascertaining whether a profit exists calls into play certain methods of determination like taking paper and pencil, figuring the wholesale cost, the cost to handle, the retail price, depreciation, possible turnover and other details. Education and experience have made this process practically the same whenever the matter of profit is to be determined. It is what is called judging. It puts the buyer's concepts of wholesale price, retail price, turnover, profit and the like before him and judges them, weighs them, compares them in figuring a possible profit. Judgment is therefore the very root of one's thinking. To think is to judge. It is another mile-post in the thinking process of the buyer. The salesman who will be successful will keep in mind the importance of good dependable judgments which will carry him through many a problem with satisfaction rather than embarrassment. He will have a

knowledge of his own company and its products, and be sufficiently acquainted with the needs or desires of the buyer to help him in passing a favorable judgment on the salesman's goods or proposition. He must be able to anticipate the mental processes of the ordinary buyer, take paper and pencil, so to speak, and figure for the buyer the different costs and other details in which he may be interested. He must be adept in making it easy for the buyer to pass judgment in his, the salesman's favor.

The final step in the reasoning process of the buyer is the combining of his judgments to form the various types of reasoning. The salesman comes into the retail store and wishes the buyer to purchase a new line of young men's college-cut suits. The retailer is in a western city, surrounded by an agricultural community, from which he draws most of his trade. This requires the weighing of arguments for and against the salesman's suggestion and a final decision in favor of one or the other alternatives. On the one hand the line of clothes is novel in design and will attract a certain percentage of the young men of the city who have never done business there before. On the other hand the store is not

equipped for satisfactory display of this style of clothes; has been catering largely to the surrounding country trade, and can possibly do better with a line that is more conservative, better adapted to the needs of its regular customers. Here we have reasoning involving a series of judgments. There is association of ideas, one idea calling another into play. There is comparison, of styles, of probable trade. Imagination is brought into use in picturing each alternative and its results. Every form of reasoning may be involved. To compete with this highest form of reasoning in the buyer, the reasoning of the salesman must be sound. His concepts, and his judgments must be proper. He must have his storehouse of associations, his means of comparison, like the goods of his competitors. Planted in memory must be an abundance of material for playing on the buyer's imagination, on his feelings, interests and other impulses. That is why in another chapter we ask the salesman to know his company and his goods, and his competitor's company and goods,—knowledge as important as is knowledge of the buyer himself.

FEELING AND FEELING-TONE

Feeling represents and expresses the tone of

the buyer's consciousness. Sensations of sight, pressure, movement, smell or taste are accompanied either by pleasure or discomfort. What is at one time agreeable may become disagreeable, and what is disagreeable may in time become agreeable. Then between the pleasant and unpleasant we find the neutral. This phase of consciousness which brings pleasure or displeasure is called affection. The manner in which it is represented or expressed is called feeling or affective tone. How about it in selling? Isn't it most important? Every good business man strives for that which will produce the best in feeling-tone. Whatever appeals to the eye must be most pleasing to the eye; whatever appeals to the ear must have harmony and quality. Movements, such as riding in the automobile, must be made as pleasing and agreeable as possible. Odors must be those that produce agreeable associations. Good feeling-tone explains the reason for demanding the good qualities in the salesman enumerated in another chapter; for the demand that character be reflected in everything associated with the company's name; for what is natural, and attractive, and harmonious and agreeable in advertising; for proper stationery and form in our letters, for good store fronts

and good appearance and display within. The importance of good feeling-tone explains the universal practise among successful modern business men of constantly trying to please in business.

INSTINCTS

In the structure of the buyer are elements which are so deep-seated that growing from them are many of the physical and mental habits which govern his every action. The motor powers, the reflexes and the instincts are the means by which the human organism directs its own movements and controls its destiny. Certain very definite tendencies are born into man's very fiber and have much to do with his life from birth until death. They comprise types of conduct which have been found through the ages to be beneficial to human life and are handed down from generation to generation. All human interests, forms of human desire, and types of human emotion are founded upon these instincts. Some are hereditary and others are acquired. No two authorities seem to be agreed on the number of these instincts. Among those which we find mentioned are: acquisitiveness, affection, anger, constructive-

ness, curiosity, envy, fear, hunting, imitation, jealousy, modesty, play, rivalry, sexual love, shyness, sympathy, sociability, secretiveness, self-preservation, self-abasement, self-assertion, and reproduction. We shall discover later that the very strongest appeals in selling are the ones made to these instincts whether it be in personal selling or advertising. Springing from them are the vast groups of human interests, human emotions, human desires and habits which constitute the complex and illimitable sources of appeal to the buyer. Everything that is sold can be traced in origin to the fact that it makes its appeal to one or more of the instincts. In personal selling, writing, advertising, or display we find, as we shall see later, the experienced man keeping in mind these instincts in his every selling move.

THE APPEAL TO THE EMOTIONS

Unusual exercise of the emotions makes one tremble or grow pale, and the heart palpitate,—the symptoms which distinguish emotion from other mental processes. Anger, embarrassment, pity, joy, surprise, derision, contempt, reverence, hope, remorse, gratitude, shame, disgust, etc., may be classed as forms of emo-

tion. This morning a blind man accompanied by a young woman sold me tickets to his lecture by appealing to pity. The "Greatest Mother on Earth" makes her appeal to pity and reverence and love, a strong appeal indeed reflecting great selling ability to those responsible for its use. Mr. Hoover's appeal for thirty-five million dollars will be a success because it is directed to the emotions.

There is a close relation between feeling and emotion. Some states of feeling like sympathy, antipathy, pride, humility, love and hate, the feeling of obligation, reverence, faith and others, often have strong emotional coloring depending on the inherited tendencies and previous personal experience of the individual. To the person musically inclined a well-played symphony may be the cause of delightful emotion; to another it would mean nothing. It is necessary only to add regarding emotions that if there can be discovered in our proposition or product the characteristics that make their appeal to one or more of these emotions, one of the most powerful means of obtaining action has been reached.

TASTES, CAPACITIES AND INTERESTS

In selling we can not overlook a group of ten-

dencies and interests of the buyer which are often as strong in their impelling force as the instincts themselves. One buyer is a lover of music, another of literature, another of business. I have in mind a lumberman who enjoys writing for the trade papers, and another who likes his race horses fully as well as his business. I was at lunch a few days ago with a dealer who talked much of the accomplishments of his wife, and enjoyed being encouraged to give vent to his appreciation. I have in mind also the great group of interests which are in a large measure common to all men; the individual himself and his welfare, his home, family and business. In a later chapter we shall see how the appeal is directed to these interests in making the sale.

DESIRES AND THEIR EFFECT

In desire there is the feeling of want and the impulse to get it satisfied. Accompanying the desire there will be either a pleasant or a painful feeling. It may be the feeling of pleasure in anticipating, in trying to accomplish. This impulse accompanying desire is what leads to action in the buyer. Many of these desires are accompanied by thought or reasoning and are

called rational, while others spring from sheer impulse alone as in hunger or thirst. All of the desires which we may have can be separated into two groups, the selfish or the altruistic; obtaining for our own benefit or giving for the benefit of others. Look over any good advertisement that was ever written and you will find somewhere in it an appeal to one or more of the desires. Listen to the selling talk of any experienced salesman or sales manager and you will find in it an appeal directed to the impulse to satisfy some feeling of want or need.

THE IMPORTANCE OF HABIT

Habits begin to form in the gratification of simple bodily needs such as hunger and thirst and protection from the weather. We dance, play golf, drive the motor, after learning to walk and talk; and otherwise we extend the number and character of our movements. At first, careful mental control is necessary, but later the habits become almost automatic, permitting the grant of attention to other matters while we perform them unconsciously.

Some people form habits easily and overcome them easily. Others form them slowly and change them just as slowly, a bitter lesson

sometimes learned by the advertiser. Sometimes they are formed unconsciously, sometimes wilfully and often through the direction of others. Existing conditions will form or change them. They are most satisfying and lasting if they are natural. Not many years ago our business men had the habit of keeping their cash in an old drawer behind the counter. The educational campaign of a well-known business organization has changed this habit to the more progressive one of using a register. Fifteen years ago bread was made much more extensively in the home than it is to-day. Education has changed the habit of the housewife in favor of better baking establishments. For many a generation the farmer could not see his way clear to do his farming without the horse. To-day the manufacturer has developed in him new habits involving the use of the tractor and truck. The most economical appeal, if the nature of the product warrants, is that to habits already established, these representing the path of least resistance in the buyer. The necessity of the expensive educational campaign is to a large extent eliminated and the appeal resolves itself into proving satisfactory quality, service, price and other universally demanded factors. Habits extend over the entire

field of activity from the time that we open the eyes until we close them again in sleep, and possibly in sleep itself.

MOOD AND TEMPERAMENT

In a discussion of the buyer we can not overlook mood and temperament. The buyer is often susceptible to certain forms of emotion. A good report from the general office may make him take on a bright aspect toward everything. He will be optimistic and ready to purchase. On the other hand, if his oil stock has dropped six or eight points, he will feel that he must go very carefully in his purchase and his former optimism will be dampened. A veil of saffron will cover everything presented to his physical or mental eye. Four varieties of temperament are easily recognizable. There is the sanguine buyer whose feelings are easily aroused yet in a colorless and feeble way. The choleric buyer is easily excitable with the emotions strong and the feelings keen. The melancholic fellow is slowly aroused, but feels deeply and is stubborn in his mood when once stirred. On the other hand, the phlegmatic buyer is slow and firm, stimulated with difficulty, and never moved to profound or lasting excitement.

We shall learn later how to deal with some of these types.

THE BUYER AND THE THINGS TO WHICH HE RESPONDS

Heredity, experience and education result in a complex development. The instincts, interests, emotions, desires and habits set the mind of the buyer in motion to act in certain ways under certain circumstances.

The phrenologists maintained a very definite theory that what the earlier psychologists termed the faculties were localized in the brain; mapped out, with certain organs in the brain corresponding to the faculties. In one part of the brain we found parental love, in another amativeness; and an accurate conformation of the skull with the brain was said to enable the phrenologist to read what was within by what was displayed without. Neither phrenology nor faculty psychology are now recognized by present-day authorities. Modern psychologists take the position that such a scheme of classification is at its best most difficult because each of these functions involves the cooperation of many other fundamental processes, and enter in varying combination in the make-up of the

different faculties. Professor Angell says (*Chapters from Modern Psychology*): "To say that an individual mind possesses certain faculties is merely to say that it is capable of certain states or processes. To divide the various and fluctuating modes of consciousness in a distinct and orderly manner, so that each may receive an appropriate name,—this in itself is no small achievement. The faculty was by the elder psychologists regarded as the cause of certain mental processes and of other faculties....Faculty has almost passed out of use in modern psychology." We can not depend on phrenology therefore to help us in the study of the buyer. From faculty psychology, due to the effort to arrange modes of consciousness in an orderly manner, we are able to obtain material that may well be brought out in a work of this kind. Some writers on salesmanship have seen fit to take over bodily the principles of faculty psychology and apply them in selling. We shall take the view of the modern authorities and mention the instances in which certain sets of circumstances affect buyers differently, —really the meat of faculty psychology without the name.

Acquisitiveness is purely instinctive. It is the tendency to hoard or collect or save. It is

strongly rooted in most men and women, displaying itself in the desire to accumulate wealth, to save money. It shows itself in business in the desire, which includes the impulse to satisfy this desire, for large and constant profits. A salesman will rarely make a mistake in assuming that acquisitiveness is a characteristic of a man in business. It explains his being in business. This characteristic is so universal among buyers therefore that it can not be left out of any sales talk or argument if the nature of the article or proposition permits. Showing a profit or saving, directly or indirectly;—showing the individual how to make or save money is probably the strongest appeal to the business man, successful business being founded on the ability to make and save.

Alimentiveness and bibativeness are forms of desire; the desire for food and drink. Foodstuffs and drinks that are attractive to these tendencies are constantly suggested in business, tastefully displayed as in the modern market. The salesman who travels takes advantage of them in gaining favorable moods or friendship. The advertiser or letter-writer makes his appeal with suggestive illustrations, carefully worded description and appropriate environment.

What has amativeness, or the instinctive tendency to love, to do with selling? Just this;—accompanying it is the desire to do for others, to whom it is directed. In May of each year the jewelers of the United States direct their advertising to the prospective bride and groom, because they have learned the strength of this impulse to purchase gifts for the June weddings. Amativeness continues after marriage, and proper sales talks, advertising and display are prepared to appeal to it. Flowers, candies, diamonds, jewelry, taxi service, stationery, specialties in wearing apparel, art work for the home, and many other articles are often sold more on account of the presence of this instinct than on account of necessity. The nature of the article and the circumstances must determine the advisability of the appeal to amativeness.

The sales person will find a tendency on the part of husband and wife to call in each other for consultation before making a final decision. The husband will not buy a hat without the advice of the wife, and the wife will not buy a suit without the word of approval of the husband. Very often the advice of one inhibits the decision of the other. The husband may be willing to buy and the wife may have a volume of

arguments against it, or the wife may desire to buy and the husband will be the inhibiting element. This feeling of dependence is called conjugality. Some articles are distinctly for the husband and he alone should be addressed regarding them. Furniture and supplies and equipment for his office or place of business, or farm, are things in which he, rather than his wife, is distinctly interested and most capable of buying, and the wife's intervention is apt to work unfavorably. A stock salesman would do well to direct his talk to the husband only. An insurance agent might find it advisable to confer with both, and a salesman of household specialties not high in price, might well spend his endeavors on the wife only. Attention should be directed to the individual whose interest is most involved, or to both where there is a division of interests.

Children are the center of affection and interest of both father and mother, the result of another instinct. The pleasure of the child, his education, his moral and physical welfare form a most impulsive group of interests with which to appeal to the buyer. Introduce something that excites this instinct of parental love, and a responsive chord has been struck in any branch of selling. The mother, being more

closely associated with the smaller children, may be more easily influenced in their behalf than the father. Toys, children's clothing, and other articles for the young are purchased generally by the mother. After the age of adolescence, the father becomes more directly concerned.

The social instinct is highly developed in many persons. They enjoy club life, outdoor and indoor sports and amusements; and they probably like to eat and drink. The difficulty with this type of buyer is that no salesmanship is necessary to win his friendship if this tendency to eat and drink is perverted. The salesman who buys the most and best meals and furnishes the best entertainment gets the business. Many sales managers take the position that this entertainment is unnecessary. There are exceptional cases where it can not be avoided. As a rule, however, I have found it unnecessary, and I know of many others who take the same position. Friendship is important but it must not be bought.

Inhabitiveness is a feeling toward a locality, as patriotism toward a country. It is the love of home including the community in which it is located. One likes to see the locality in which one lives improve and prosper. I know of a

large manufacturing company of the West that built up much of its business on the strength of this patriotic feeling, extended in this case to the entire state. With quality and price, service and other factors equal the dealers and public officials took active steps to defend the new home industry, in some cases passing resolutions insisting on the use of its product for public work. This inhabitive tendency probably explains the great growth and activity of the many commercial organizations now in existence over the world. We find advertisements of flowers, trees and shrubbery for the home written to appeal to inhabitiveness. It has its basis in self-preservation, another instinct. If we have no home we desire one; having one we want it modern in every respect. The business of the retailer is directly dependent on this instinctive tendency.

There is a universal desire to want to live and grow old gracefully. Those whose ills are imaginary as well as those who suffer from actual ailments, are constantly appealed to in both legitimate and quack advertising. Many an advertisement of elixirs in the form of patent medicines, gymnastic formulas, hair restorers and cosmetics, is framed to appeal to this desire called vitativeness. The world is

striving to remain young and healthy and good-looking. The beauty parlor, tonsorial parlor, and other kindred lines of business have become necessary units in the commercial world because of the desire to live.

We find the fighting instinct personified in business. The fighter is to be found in every locality and in every line. We must not antagonize this man. He will not stand for it. If we take off our coats and fight for him rather than against him we shall get somewhere. "You are right, exactly right, Mr. Yost. My company made a bad mistake in doing this and I will see that the man responsible gets what he deserves. We want you satisfied, and I am going to see that you *are* satisfied. That was a very poor piece of work and I do not blame you for being angry about it." The fighter usually meets with friction and opposition. It is an agreeable surprise to him to be defended. Let him have his way, be humored; let his opinions be respected and he will devitalize and eventually meet the salesman graciously. Some woman too will come into the retail store and abuse everybody from the sales person to the general manager. It is hard to take abuse but it must be done just as we have done in the case

mentioned above; by fighting for this individual and not against her.

Occasionally we come in contact with the fellow who has got into business for spite, or prejudice, or some other unfortunate reason. He has not sufficient personality or ability to run his own business and devotes much of his time and attention to seeing that his competitors are no more successful than himself. He is the destructive buyer. I remember meeting a buyer of this character on many occasions. He was a lumber dealer in a city where there were two other yards. It was his boast that these three yards had been in this city for six years and that none of them had made a dollar and would not make a dollar as long as he could prevent it. One can not afford to do business with such a dealer. By taking up the matter with his competitors an arrangement was soon made to have this yard purchased by a third party. Both other yards were afterward able to make a reasonable profit and were so well pleased with the suggestion that they were glad to give their business to my company.

Another type of buyer comes to mind,—the secretive fellow, quiet, reserved, a better listener than talker. If this tendency is not over-

pronounced it is advantageous in obtaining and holding attention. It is displayed from the time that the salesman makes his appearance. The manner will be quiet, and generally slow, little affected by the salesman's presence; a tendency to continue with routine. Occasionally this reticence is assumed with the intention of avoiding the salesman, yet we may not conclude that this is the case until it has been proved. The only safe manner of approach is to be patient, keeping constantly in the buyer's presence to serve silent notice that an interview is desired, entering a wedging word here and there, and waiting quietly for the opportunity to open the discussion. If this reticence continues for an unreasonable length of time, the matter should be brought to an issue by speaking frankly to the buyer in an effort to secure an interview or if necessary an appointment. If he gives a reasonable excuse for not granting an interview just then, the salesman must not jeopardize his standing by insistence. If there is a tendency to be arbitrary, the salesman then has the right to present as forcibly as the occasion demands his reasons for wanting an interview. The importance of tact must not be overlooked. It is useless to spend time in

getting an interview with one who is unfriendly as a result of the salesman's persistence.

The salesman must expect to find cautiousness in the average buyer. It is a necessary characteristic of the good business man. Some situations require more caution than others. The character and importance of the sale determines the amount of attending cautiousness to be expected. Overcoming it is merely a matter of convincing; of obtaining confidence. We shall see later how the sales manager overcomes cautiousness by placing in the office or home such articles or instruments as pianos, talking machines, dictaphones, books, and other things, in the purchase of which unusual caution is displayed. Letters of reference, lists of others who have purchased and are using, inspection trips to work that has been done, public demonstrations like those given by manufacturers of tractors, fire apparatus, etc., are all instances of methods used in overcoming cautiousness. The retail dealer tells the customer to take home an article and if it is not satisfactory, return it. If an article will not stand the acid test of actual demonstration its life in the selling field will be very short.

Have you ever come in contact with an individual who would not accept an honestly

given compliment? No, you have not. There is a way to give a compliment and have it set well. There must be sincerity in the giving, and it must be regarding something worth while. We can not compliment the insignificant or ordinary. We must look for something about the buyer, his family or business that deserves a compliment. Flattery is not sincere yet it is often used to advantage. It must be tactfully given or it will not appeal. A salesman who was attempting to obtain my subscription for a certain magazine was not able to get me interested to his satisfaction. Finally he asked if I would be willing to write an article for this magazine. This question led me to ask him why he had made the proposition to me, and he admitted that it was an appeal to approbativeness with the hope of getting my attention and interest.

Some buyers have high regard for their own opinions and judgment. They have had the experience; claim to know just what is wanted and will not be dictated to by the salesman. The professional buyer is apt to develop this trait. The fact that this trait exists does not mean that the other characteristics are unfavorable. On the contrary they will be distinctly favorable. There will be strength of

character and the respect of friends and acquaintances. This self-esteeming buyer must be given all of the facts and permitted to use his own judgment. He will finally express himself quite positively for or against a purchase and that will virtually end the matter for the time being. We need not hesitate to give this man an honest compliment. Our efforts to sell him must be patient, renewing in a later call, or by letters, by actual demonstration, or trial our efforts to sell. A firm or stubborn buyer, which this individual is apt to be, can not be driven. He must be very gently led. "Now, Burgess, I know this business better than you do. I know what I can use here." This is the statement of a self-esteeming buyer. "I am getting good treatment from the firm from whom I now buy and see no reason to change." More patience, tact and resourcefulness are required for the solution of this problem. How about talking to him something like this? "Mr. Baker, I know that you have been buying a certain brand of cement for years. You have had good treatment from these people and they in a measure deserve your loyalty. Just let me go over this matter with you, and if after I have finished your good judgment does not tell you to do business with me, I shall drop the subject...

You have been in this business long enough to see immediately the advantages of this offer. Look at this map (showing a map of the state). Here is our mill: here is your yard. I can keep you supplied with cement just as you want it within a few hours after you phone for it. I will have to haul the car fifty miles while my nearest competitor, from whom you now buy, must haul it five hundred. I can use this car ten times on ten different orders while the company from whom you now buy can use it but once. You will help the car situation; you will get your cement quickly; you can take down that telephone receiver and talk to us at any time; you will get the advantage of being closely in touch with us,—cooperation, first-class treatment, everything that any company can give, and you will be doing something to build up this good community by helping this worthy home industry. You have been right in contending that the trade of the people living around this city should come to you, the local dealer. You have been right in telling your trade that you are located here where they can reach you and talk with you conveniently and have the benefit of your cooperation. That is why I know that you will feel the same way

regarding my company. I am going to leave the entire matter to your good judgment."

Here we have adopted the selling talk of the self-esteeming buyer in fighting for his own business, and applied it as a weapon against him. Placing the responsibility on him of passing judgment fairly has a very good effect.

It sometimes requires years to convert the stubborn buyer. Cooperation from every source should be obtained by the salesman. The office can do much. Letters, advertising, visits from the sales manager, cultivating friendship, placing the buyer under obligation, will be some of the means. Many very good accounts are started with dealers of this type by going into his city, getting well acquainted with his customers and through them obtaining business on which this dealer will receive his commission.

In the study of the psychology of the buyer we have found how the concepts become ossified if they are not enriched, resulting in one's becoming narrow in view and actions, wanting to continue in old paths of habit or policy, with the same old concern regardless of circumstances. This may develop into old fogyism. We are likely to be mistaken in interpreting as fogyism what really is good business. The fact

that a dealer demands the plain, unassuming and hard wearing clothing may be due to the demands of his trade which comes largely from the country or industrial districts. A visit to the store of the small-town merchant will convince one that the same style and character of goods we find in the large cities are not used in the country. If a dealer should prove narrow and backward the salesman need not hope to revolutionize him. It can not be done. He must be given what he wants.

Calculation frequently displays itself in the buyer, in negotiating the sale of insurance, bonds, investments; sales involving a complexity of costs and figures. He must take his pencil and paper and go into details. This tendency should be anticipated by the salesman and the problematic situation made as clear and simple by means of figures as possible. A dealer interested in selling me a set of five tires furnished a well-arranged diagram showing just what these tires would cost, what discount he would allow, the amount of guaranteed mileage, the allowance for each of my old tires. In his sales talk all of this had been explained yet this memorandum made the details clearer and more easily remembered.

The appeal to this calculative tendency can

be carried to the extreme. A certain concern advertising at this time, in the attempt to add originality and interest value, as well as appeal to the tendency to calculation, has inserted a stereotyped conglomeration of hand penciled figures in compound interest which suggests effort in reading, not to mention understanding. It is too complex.

Have you ever thought how strongly the process of comparison enters into buying? A buyer believes that a certain automobile is the best for his purposes. A salesman demonstrating another car has to explain every detail of the construction or operation of the new car in terms of the one which the buyer has in mind, or in terms of other standard cars. The comparative speed, power, durability, finish, size, comfort and price are all spoken of in terms of other cars or standards,—comparison at every step.

This comparative tendency explains the necessity for developing the concepts pertaining to one's business, and especially one's product; obtaining knowledge of one's company and its goods, and of competitors and their goods.

Imitation is largely instinctive. The mob spirit, where the individual often subconsciously falls in with the purposes of the mass,

is explained by this tendency to imitation. In social life a large number can be counted on to follow the leaders. The family of Judge Blank is regarded as very musical, the daughter having studied abroad. If Judge Blank thinks enough of a certain piano to use it others will also want to use the same make. What is good enough for Judge Blank is good enough for them. Imitation breeds rivalry at times. People must live on a standard equal to that of the neighbors and friends. Like their friends or neighbors, they must have the automobile; they must have their daughters in the private school; they must belong to the riding club; must have the antique furniture, even though they can not always afford these luxuries. Recommendations, memoranda of introduction, subscription lists and similar devices are used to advantage by the sales person in these cases.

Apart from the imitative class are those who want to be original and individualistic, standing out as examples to be followed. This is a progressive tendency. It separates one from the crowd into a class by one's self. Why does a merchant carry out a certain color scheme of blue or red in connection with his business? Why does he have his store, delivery wagons

or cars, stationery, advertising, decoration,—everything in red? Becauses he wants to be individualistic and give his business personality. While in a leading clothing store a few days ago I noticed a salesman giving special attention to a prosperous-looking young man whose appearance and actions indicated that he was strongly possessed of individualistic desires. The salesman was alive to the situation and displayed a line of striking style and color, something that the ordinary individual could not wear. The result was the sale of an overcoat of extreme design in rich green. Stores, offices and homes are often constructed and furnished, if not even located, to carry out this desire for individuality.

Thus far we have discussed the mental equipment of the buyer, including the nervous system and its relation to the sense organs. Now we come to certain outward and visible attributes or powers that are well worth examining.

DETECTING QUALITIES AND CHARACTERISTICS

Much attention has been given to the weighing and measuring of a man's mentality, his character, by study of the outward or visible evidences. We have seen how phrenology pro-

fessed to show that a certain portion of the brain gave rise to a certain faculty which could be located and its strength determined by the character of the bumps on the head. Later research has proved that phrenology rested on a false basis.

There are those who believe in physiognomy; the art of discovering characteristics of the mind or temper by observations of the form and movement of the face and body. Since the beginning of history, men have expressed their faith in this method of reading the character. Opposed to this view are those modern business men who are inclined to believe that so-called character reading is too uncertain, too dubious to be practical and useful. We shall let Doctor Katherine Blackford, one of the late exponents of character reading, tell us in her own words what she claims for the alleged science. "We do not wish you to misunderstand our claims for the science of character reading. Character analysis is not a science in the mathematical sense. As we have said in our introduction, we can not place a man on the scales and determine that he has so many grams of industry, or apply measurements and prove that he has so many centimeters of talent for salesmanship. We do claim that it is classified knowledge

based on sound principles; that it is as accurate as the science of medicine; that it can be imparted to others and that any one can test it beyond any question of doubt.....Men differ from one another in nine fundamental ways; color, form, size, structure, texture, consistency, proportion, expression and condition."

E. B. Gowan in his work, *The Selection and Training of the Business Executive,* says: "Suffice it to say that this system takes for its basis nine factors, termed variables,....(naming them). Even granted that this is a complete classification, which at the best is considerably beyond the limits of probability, these nine variables constitute exactly what their name indicates, items which are in themselves subject to almost innumerable variations. Evidently we have here a system too fearfully and wonderfully made to justify the precise results claimed for it."

Another author, William Maxwell, in *The Training of the Salesman,* attacks character reading without reserve. "Personally, if I were in search of an executive, I do not think his complexion, and the color of his eyes or hair would be taken into consideration. If this is unscientific, the character reading dopesters and tipsters may make the most of it....I am

not yet ready to adopt the superstitions which have been welded into the alleged science of character reading."

But the salesman will find at least some physiognomy claims reasonable, and even acceptable for use in the business world. If the modern character reader will grant me the added assistance of speech and action I feel that the business man can gain considerable benefit from this science. The list of elements or fundamentals does not specifically mention speech and action, yet these seem to be contemplated in the process as we find them referred to by different writers. The following is a broad statement from Doctor Blackford, which I believe any business man, including Mr. Maxwell, will agree is well put and worthy of our consideration. It indicates that the modern character reader considers every detail of evidence of character including speech and action. "Motives lie at the very foundation of being. They are deeply imbedded in the very cells and fiber of the individual. They shape his thought, his habits and all his actions. They show themselves to the practised eye in every physical characteristic, in the tone of the voice, in the handshake, gestures, walk, handwriting, clothing, condition of the body and expression of

the face. They festoon the personality with flaunting and infallible signs to be known and read by all men who care to take the trouble to learn. Some are plain; others more elusive. The simpler motives, after they have held sway for years, are easily discernible. Sensuality, arrogance, vanity, coldness, benevolence, sympathy, and others are easily determined. In order to be successful in persuasion we need to be able to trace all of the feelings, both permanent and transitory." It may be interesting in view of the difference of opinion which exists regarding character reading to examine the claims of such writers as Doctor Blackford from the point of view of the business man with the idea of selecting whatever may seem to be useful in the selling world.

In a general way the character reader and the earlier physiognomists divided people into: 1, the group with great intellectual capacity, capable of accomplishing much in education and training, fitted for intellectual work, with mental grasp, comprehension and reasoning power; and 2, into the group which is only moderately intellectual, the members of which express themselves more in a physical than mental way, who have clearness of mental action in some special direction like merchandising, or

contracting, or farming, or whose intellects may be incompetent in every way. The theoretical and the practical are the designations often given to these two groups. The thoughtful, reflective, philosophical, falls on the one hand, and the practical, fact-demanding mind, quick to ask for the demonstration, not interested in the theory, on the other.

In the physically frail the mental powers grow at the expense of the physical, the large heads and active minds using up the body's nourishment which is not always sufficient for this expended nervous energy through the brain. In this type we have the pear-shaped head, large at the top, and slender and delicate at the jaws. With this type we find also delicate and slender hands and feet, narrow shoulders and thin chest. They are sometimes designated as the mental type. The eyes will be bright and the nose relatively small. The nails, nostrils and lips will be thin, the bones and muscles and abdomen small, and the speech and action quick. They will be excitable, sensitive in feeling, high-strung, bright and sparkling, and very apt to be emotional.

The fat man, or the man of the vital or vegetative type, as some called it, is placed in a class by himself. In the extremes of the

fat type we find the large mouth, comparatively small and depressed nose, globular or puffy cheeks and chin, slow motion, slow speech, large abdomen, love of food and drink, ease, freedom from care, and lack of mental effort. To the man with brain and talent, a body of the type described yet not too extreme, serves as a wonderful source of power by reason of its nutritive reserve. The person that is easy-going is friendly, approbative, kind and affectionate, and likes children.

The third group includes the man of bone and muscle, sometimes called the motive type, broad, strong and wiry, elastic, energetic, quick in movement. He may be either tall, bony, enduring and graceful, or short and broad, with short extremities, round muscles, square face, high and wide cheek-bones, prominent chin, square hands and large feet, and if he has unusual mental capacity, a high, wide head. A healthy respiration system keeps the circulation lively, resulting in buoyancy of spirits, quickness, clearness of apprehension, ambition, hope and progressive mentality. He enjoys eating and drinking, athletics, social life. If he is more bony than muscular, he has large joints, and the lower part of the forehead projects over and around the eyes, the tips of the fingers will

be square, and a comparatively small angular shaped head will rise high above the ears. Lime, phosphates, magnesia and soda, which make bone, are said to give stability, integrity, decision and firmness to the organization.

Some anthropologists give support to the belief that the ambitious and restless, the optimistic, energetic leaders are light in color, and that the peasants and tradesmen and men of religion who practise resignation to a higher degree are dark. Men of action are said to be light. We are said to find genius for government, exploration, conquest and progress in the light, and genius for art, literature, religion and conservatism in the dark. While this distinction might have been more marked in the early history of the world, in this day, after the fusion that has been taking place for centuries, business men will be inclined to regard color as a mere bit of evidence of character which can not be taken too seriously.

The form of the face and features may be of some importance, yet we find so much complexity in this element that it, like color, can be taken only as evidence. It is true that sharpness indicates quicker action than bluntness and roundness. In the sharp face, with the long pointed nose, retreating forehead, large eyes,

prominent teeth and retreating chin we have the evidence of quickness; the fast head, it is sometimes called,—the convex form. The concave form, on the contrary, has the high, prominent forehead, flat brows, deep-set eyes, small, turned up nose, retreating teeth and long prominent chin, and is said to indicate slowness. Out of several thousand dealers with whom I have been personally in contact during the last few years, not a sufficient number could be definitely placed in either of these classes to give the matter consideration. Nature is inclined to avoid extremes. The average business men are medium; of the bone and muscle type we might say with safety, displaying no strongly concave or convex tendencies. They are largely fact demanders, energetic, reasonably fast moving, practical, fairly intellectual. Their line of work demands these qualities. Most of them would be inclined toward the convex rather than the concave type, but only very moderately and scarcely noticeably so. The character of the business may have something to do with the type. In the lumber business we have bone and muscle, practicality, demand for facts, health and resulting good spirit, activity, clearness of apprehension, ambition and hope, enjoyment of eating, drinking, outdoor and social

life. In the book selling business we might find the buyer of a different type, inclined more to the mental than the physical.

Texture refers to the arrangement and character of the muscle and fiber and cells of the body. It is claimed that the texture of the entire organism, including that of the brain and nervous system, is indicated by the nature of the skin and its appendages, the hair and nails. It is simply evidence of type; enables one to classify the buyer as frail, or of the bone and muscle or fat type. Coarseness of hair, skin, features, loosely built legs and feet and hands are evidence of physical coarseness, to a moderate extent displayed in the bone and muscle type. Fineness of skin, silken hair, delicate features, slender legs and finely molded hands and feet are evidence of fine composition generally displayed in the mental, or in the physically frail type. In the one case we look for the matter-of-fact mind and in the other, the theoretical; less emotion, less sensitiveness, less ambition and hope perhaps, less mental activity and a greater demand for facts in the former type than in the latter.

Structure, like texture, is indicative of type; evidence of frailty, or of fatness or bone and muscle consistency. The immense head and

slender body place one in the frail class. The small head, large jaws and high bone and muscles place one in the bone and muscle class, and the small head, round face, round body and round extremities may place one in the class with the fat man. We have already enumerated the qualities and characteristics of the different types.

The proportion of one part of the body to another, or one part of the head to another, since each of these parts has its particular function, is regarded as important by the character reader. For speed in the animal we look for wiry legs and slender body. If large, heavy legs are found with a slender body we sense a lack of proportion, or if the head is overly large we at once detect the lack of proportion. Provided lack of proportion is not sufficient to affect mentality, what does it mean to the business man in detecting character? It is probably no more than a scrap of evidence.

Expression and condition must be given credit for more than any of the elements on which character reading is based. The emotions display themselves in the voice, eyes, expression of the mouth, in the actions, manner of sitting and standing or moving. The buyer's finer and more elusive thoughts, including

those pertaining to his interests, desires, emotions and habits, express themselves in what he says and does. We have seen in the study of the emotions how motor reactions, like the increased circulation, heavy breathing and other symptoms, display themselves in spite of our efforts to conceal them. Many of these emotions and other trains of thought and feeling evoked by the interests, desires and habits leave an eradicable impress on expression which the character reader says is just as sure and as strong as the effect of the trade winds on the oaks of California. Agreeableness, sympathy, honesty, mentality, irritability, concentration, surprise, pleasure, suspicion, fogyism,—nearly every state of mind in which the business man is interested is displayed in expression. Let the buyer's mind unfold itself in speech and action and we shall ask little more regarding character. Speech is the means of openly expressing one's mental state. It is the very strongest and most convincing corroborative evidence of what is read in the expression. "I wish you would not bother me this morning, sir, I am very busy and I am sure that your proposition will not interest me at all." This, coming from the buyer with firmness, is indisputable evidence of his present

frame of mind. Rapidly and indifferently leaving the salesman alone the buyer says: "No, sir, I would not buy from your company under any circumstances. I have been in business long enough to do my buying where the volume of my business is appreciated and where I get the best deal."....evidence of acquisitiveness. "You need not talk to me about what my competitor has done. I have my own ideas about running this business, and they will be carried out."....a statement from the self-esteeming buyer. A buyer becomes argumentative almost always in speech. Speech and action determine stubbornness, impoliteness, irritability, temper, bluff, mentality, in fact every characteristic in which the sales manager or salesman is concerned. The clever salesman can by suggestion and questioning lure the buyer to disclose in speech and action his tendencies or motives, opinions, preferences, interests, habits, or what not.

We can not overlook the fact that the character of the buyer is to some extent disclosed by the environment that he has accepted for himself. His store and the way it is operated, his home, his family, the town he lives in, possibly the kind of horse or automobile that he drives,—all have a tendency to reflect character.

I know a dealer who orders carloads of material on picture postals. He is not progressive and displays some of the characteristics of the old fogy. We may expect to find the business man of the large city, where competition is keen and interests large, to be more alert and careful and shrewd than the man of the little place where competition is not so keen, and we shall find him also much the busier.

Condition is the element named last as comprising one of the variables in character make-up. It refers to the appearance; the clothing, the condition of the hair, skin, nails and teeth. The importance of this element depends on circumstances. It will mean much to the man who is applying for an executive position, and little to the buyer in the small town who must labor hard to keep his business intact. Condition is distinctly a variable, depending upon the character of the business or work and on the environment and the society in which the individual must live. Both local custom and habit have much to do with the standards to be expected.

Let us examine the physical details of the head, including its shape, and that of the nose, mouth, chin; the size, location and character of the eyes, the hair, brows, etc.

Quality and texture of the hair are evidences of type. Very coarse hair is found on coarse, strong, dull and stupid individuals and animals. The man of the West in his ruggedness may display these evidences of coarseness and yet have fine mental qualities. Soft pliable hair ought generally to indicate fineness of quality in the body, refinement, keen mentality and delicacy. Fine, long and glossy black hair is evidence of intelligence, deep feelings and lasting affections. The dark shades like brown will be accompanied by these same qualities in less degree. Red reflects intensity of feeling, ambition, and emotion, refinement, quick temper, agreeableness and love of activity. The lighter the hair the greater the tendency to display transitory emotions, gay manners, love of dress and amusement, vivacity, fickleness, etc. It is said that there is less stability, integrity and moral courage in the individual with curly hair than in the one with straight hair. Curly hair indicates changeable character, often brilliancy, vivaciousness, quick temper. The wavy hair is found upon the heads of the talented. With it we are apt to find emotion rather than reason, as in the case of poets, musicians and others. They are gentle, refined and sometimes effeminate.

In the profile of the forehead we find the perpendicular, the projecting, and the receding. With the normal perpendicular forehead we are apt to find straight lines in the nose. It is the head of the artist and of the esthetic individual. The receding forehead is accompanied by warmth, fire, enthusiasm, sympathy and sensibility much more pronounced than is found with the perpendicular. Here there is said to be energy, good reasoning power, sympathy, enterprise, practicality and progressiveness. It is the practical forehead and therefore ought to be found to a large extent among business men. If the forehead projects there is a tendency to dullness, slowness and impracticality. If it bulges at the top there is the tendency to be visionary, impractical and theoretical. If it is large at the middle there are good comparative and memory powers. Bulging over the eyes denotes keenness of perception. The reflective or reasoning head is broad; the concentrative forehead, high and narrow. The well-balanced is reasonably broad, reasonably high and reasonably full.

Does the brow mean anything? We are told by the character reader that the dull have the low and narrow brow and sunken temples. Prominent at the corner of the eye, extending

back and ridged, the brow denotes orderliness. Brows that are knotted, with muscular development above them and a full forehead, belong to the abstract thinker. An intense and energetic nature, concentrated power and nervous force are said to be reflected in the dark brows accompanied by dark skin and hair. If the brows are full and bushy and the hair the same the possessor is inventive, inclined to be irritable, and has a strong personality. Unless there is a good forehead to offset them, faint brows denote weakness. The individual with the arched brow has a negative nature, follows instead of leads, does not think for himself and is a dreamer.

Even the shape of the nose has its significance, we are told. There is a resolute, determined, ruling mind denoted in the eagle's beak, called the Roman or aquiline nose. That of the artist has straight lines and is called the Grecian. In the pointed nose we read caution, reserve and cunningness, and if it turns downward, even suspicion and intrigue. In the fat nose with the backward rolling nostrils there is sensuality. If it is large and arched, with the tip dropping and turning inward there is caution and suspicion, the nose of the driver of hard bargains. The up-turned nose leaving

the teeth slightly exposed is that of malignity and coldness,—"snippiness."

The eyes, their expression, shape, color and location have their meaning. The buyer with the black or dark brown eye is impetuous; with the blue or gray eye, calm and intellectual. There is determination, selfishness, stubbornness and shrewdness in the deep-set eye regardless of color, more pronounced in the brown and black. Large full eyes, if normal, indicate culture and refinement. Transparent and sparkling under well-delineated lids means love of elegance and good taste, and quick discernment, possibly pride and irritability. Cunning and trickery may be reflected in the small, deep-set, sparkling black eyes and active jesting mouth; without the active mouth there ought to be reflection, taste, elegance and accuracy. The twitching, rolling eye is the eye of the unsteady and weak willed. And now the eye of the cold and mercenary person,—colorless, prominent, the pupil small and seldom dilating, and the glance fixed. The sensual eye is prominent, pale blue, liquid or dull, with no depth or transparency, the rim of the upper lid thick with fullness above and drooping but not from concentration. The eye reflects the intellect. We judge its quality by transparency, clearness,

dullness, depth, size and flexibility of pupil, quickness of muscular motion, position with reference to the brows, fullness and position of the upper lid.

If we would know human nature we should watch the mouth also, according to the character reader. If it is well closed with the muscles drawn and the chin thrown forward, we have a strong willed person. If the upper lip projects there is sentimentality. If the lower projects we have irritability and quick temper, yet firmness of character, even obstinacy. Both lips advanced indicate honesty and sincerity. The lips of the sensual are fleshy; and of the cold, precise and active, thin and closed to a line. If these thin lips turn up at the corners, vanity lurks there, and if they turn down, maliciousness may be found. The open mouth, with the projecting upper lip and teeth, suggests weakness, stupidity, coarseness and rudeness. Conscious mental effort contracts the muscles of the mouth. The more strenuous the thought the greater the compression of the mouth. If the line where the lips come together is wavy and irregular, temper and irritability show themselves.

And now what about the chin? The character reader informs us that good common sense

shows itself where there is an indentation in the middle of the chin. If the chin is large and broad and heavy, there may be violent temper. A little peevishness will show itself if the chin is small and sharp pointed. Having no chin indicates weakness, and the protruding one reflects strength. It is a cold buyer who has a flat chin, and a good-natured one whose chin is round. We are safe in inferring that the man with the double chin is a lover of good food. If the point of the chin comes up and the tip of the nose down, we have the suspicious and cynical. Meanness and lack of soul qualities are found when the chin is narrow and the mouth small.

The personal laugh reveals character or lack of it. Those who laugh loudly and easily are vain, stupid or indiscreet, and those who laugh moderately or mildly are prudent and intellectual. A quiet natural laugh has depth of character and feeling. It indicates kindness and cheerfulness, sense of humor, mental breadth, liberality, etc.

I have now mentioned the characteristics of the different types of men and women; analyzed the claims of the character reader regarding the details of form and shape especially of the head, including the forehead, eye, nose,

mouth and chin. We must remember, however, that indications of character must be considered as a whole, not passing judgment on the strength of a mere detail, such as a peculiarity of the eye or mouth. Everything from the hair to the walk, including speech and action should be considered, and conclusions drawn even then will sometimes be wrong. After this examination of character reading we must admit that although some of the claims are too broad and others too definite, in a general way they are reasonable and deserve the consideration of the man in business.

CHAPTER III

MAKING THE SALE

Reflecting on what has been brought out in the last chapter regarding the psychophysical and mental equipment of the buyer and the effect of different kinds and degrees of stimuli when applied to this organism, we find that making the sale resolves itself into the matter of the selection and use of either the spoken word in connection with the presentation and demonstration of the object of sale, as in personal selling, or the printed word in connection with the picture or illustration as in advertising,—each making the appeal through one or more of the senses. In the actual demonstration of the automobile the appeal is made to sight for color, lines and general appearance, to touch for quality and comfort, and to hearing for the sound of the motor and of the car in action, to the muscular and organic senses for ease, comfort and speed. In advertising, sight alone is directly involved, the other sensations being experienced only imaginarily or mentally

and so far as they can be realized by illustration accompanying words of exposition, description, persuasion or argument. In the sale of perfume, in personal selling we have the container itself attractively presented for sight and touch, and the contents to appeal directly to the sense of smell; while in advertising the sale depends on the effect on the imagination,—ideationally, of the picture of the container and the accompanying suggestion of fragrance in the illustration and wording.

Knowing the equipment of the buyer for perceiving, imagining, remembering, reasoning and willing, and knowing that different impressions affect the feelings differently; that the buyer has different motives, interests, emotions, habits, and different moods and temperaments, we may prepare our ammunition in such a way as to obtain the best results.

We have seen how attention will play its part in making the sale. It must be held to the very last step in the process. Then in their order, often blended together so that no well-defined line of separation is possible, we have the obtaining of interest, which transforms into desire, and this into volition or the resolve to buy, and actually buying. In many cases all of these steps must be encountered by the salesman.

In many others modern advertising programs relieve the salesman of this preliminary work such as struggling for attention and interest; and yet in still other instances advertising takes upon itself the burden of leading the prospective buyer through every step of the process from attention to volition. From whatever angle or in whatever branch of selling we may be working we shall find the elementary procedure the same. If we are to take the entire burden we must obtain and hold the attention; arouse interest and create desire and final decision to possess. In this process the salesman representing either the wholesale or retail dealer meets with the individual;—the advertiser and letter-writer, with the group or class. The importance of each step in the process depends on the particular circumstances presented by each case. The fact that Mr. Charles Schwab is to be interviewed may make the introduction the most important part of the process. Then the fact that a buyer has been defrauded in a similar deal may make the problem of obtaining interest the most difficult. Furthermore, a buyer may long for an article immediately after examining it, yet recent reverses will prevent favorable volition. Blended together, therefore, in the complete process of

making the sale, and not always distinctly separable, are the following steps, which by reason of the support of the psychologists, may be regarded as established: 1, the introduction; 2, obtaining and holding attention; 3, arousing interest; 4, intensifying this interest into desire; 5, changing desire into decision to possess; 6, converting this decision to possess into actual possession.

IMPORTANCE OF THE INTRODUCTION

The importance of the introduction depends on the circumstances attending each case. It may be the most important part of the entire sales process. Being able to obtain it may mean that the sale is otherwise assured. It is certain that more time and thought should be given the introduction to a man like Mr. Schwab than to the average merchant. A proper introduction comprehends necessary preparation, what some writers prefer to designate as a good Pre-Approach. It should always take place at the proper time and under favorable conditions. The smaller merchant who is successful is generally busy with a customer, with his books, or the many other details of managing and selling. The larger buyer has

his routine which first commands his attention, conferences, correspondence and other responsibilities. Everybody is or ought to be busy. The salesman must expect to meet busy men. The introduction therefore may be the last as well as the first step of a sale if it is not properly attended to. The salesman must be patient, tactful, resourceful and aggressive. He can not force his way, and yet he can not let the suave buyer brush him aside with a smile. He must be confident, dignified, persistent, yet always a gentleman, never overlooking the fact that one never knows where the next sale may come from, and that very often the individual most difficult to approach makes the best customer eventually.

OBTAINING ATTENTION

Professor William James says regarding attention (*Psychology,* American Science Series, page 217: "One of the most extraordinary facts of our life is that, although we are besieged at every moment by impressions from our whole sensory surface, we notice so very small a part of them. The sum total of our impressions never enters into our experience, consciously, so-called, which runs through this

sum total like a tiny rill through a bowery mead. Yet the physical impressions that do not count are there as much as those which do, and affect our sense organs just as energetically. Why they fail to pierce the mind is a mystery."

Attention is the very center of vitality; the very life of consciousness without which it drifts uncontrolled. It brings consciousness to a focul point causing it to center itself on some particular thing. It can be centered on objects outside the mind as well as within; on some material object such as the article of sale itself, or on an imaginary picture of the article that has come to mind.

In whatever branch of selling we may be interested, the laws of attention and interest will have to be respected if our work is to be done satisfactorily. Whether the problem be that of the salesman in the field or store, or that of the sales letter-writer or advertiser, cognizance must be taken of what psychology has laid down in laws governing the processes involved in gaining attention.

WAYS OF GAINING ATTENTION

First: We may have to depend on increasing the intensity of an act or article to make

it focus the attention. We may have to develop a louder voice like the newsboy or barker, call out more constantly like the ticket seller at the circus, insert more lights in our electric sign, put brighter colors in our display windows or in our store. Second: We shall have to see that the intrinsic interest in the thing itself is sufficient to give it the power of obtaining and holding attention. If this intrinsic interest does not exist in the article, the attention value must be derived by associating the article with something that will command attention; something with resulting reward or benefit, or possibly punishment or loss, or suffering. We have found that man has a group of coordinated interests which are native to some extent, taking root in the instincts, or acquired by education and experience. This group of interests is the dynamic force which brings the buyer to play his part in this drama of buying and selling. The thing to which we expect to have attention directed must therefore have something in it or about it to make its appeal to some of these interests which will be enumerated very shortly. Third: In order to obtain the best results, we shall have to provide for accommodation of the sense organs to be used, so that the impression can be made with

the greatest effect, letting no noises, or smells, or unfavorable environment distract. Fourth: For very good effects we shall have to have the mind of the person in the expectant mood for giving attention. The advertiser has this in mind when he sends out such copy as the following: "Watch this space for our Saturday Bargains." "Lend me your ears—Mr. Sales Manager," the heading of an advertisement of a professional advertising man appearing in a magazine this month. We all recall the great advance advertisers' campaign of Dodge Brothers, which had the effect of preparing the minds of the readers for what was to come. The theater man also often takes advantage of this possibility of arousing expectant attention.

VALUE OF ATTENTION REFLECTED IN RESULTS

Attention brings out more clearly the thing on which it is focused. The colors of the gown or automobile, the details of machinery, the hidden parts of a picture or puzzle, whether they be presented to us actually in the object itself or only in the imagination, become more clear and distinct. This is important in perception and memory, we have found. The

clearer the impression the more perfect the perception, and the more lasting the image—just what we strive for in all branches of selling. With attention, sights and sounds and other processes become more intense. Colors which were at first unnoticed will become brighter, richer and more vivid; the sky will look bluer, the stars brighter, and the smell of the perfume will seem more fragrant. Similarly, attention to time makes it pass more slowly. The hours pass wearily while we are waiting for a train. The singer seems to hold the tone even after singing has stopped if the position and expression of the head and face have not changed. And so objects of sale themselves, or illustrations, or words of argument or suggestion, or head-lines will remain with us according to the attention given them. It is almost impossible to rid the mind of the pleasant strains of some new melody that has been introduced to us at some light opera performance.

It is natural to give attention to things which we have been taught by experience or otherwise to observe. A hill of ants will hold the attention of some persons for hours while others will pass over it unconcerned. In order to obtain the attention of those who are not interested, or who for some reason may not see the

details which we wish to bring out, something must be done to direct it, like labeling, pointing to with arrows or ribbons, or personally directing the attention. This directing of attention to things brings them quickly into consciousness.

Even volition is based on attention. Every idea resulting from attention passes over the arc of the nervous system from the senses to the muscular region resulting in some kind of action. If the attention is divided this weakens the response, may neutralize it. Hence the importance of having attention focused on one thing. Another important characteristic of attention is that it is short-lived, comes and goes in waves, flits about from one thing to another. It first lands or focuses on some particular thing and then momentarily passes from one thing to another until some other object elsewhere attracts it. The skilful advertiser, or window-dresser, or letter-writer caters to this tendency to be rhythmic by supplying attention something upon which to focus, and something associated with this to which it may easily pass and receive a reinforcing impression,—first to the automobile as a whole, then with the assistance of the salesman to the lines, beauty, durability, speed and other details; in

advertising and in the display window, something upon which to focus, like the maiden in the bathing suit, and something associated with this to which the attention may easily pass,—the gentleman perhaps, wearing the same brand.

Nor should we overwork attention by giving it too much range, too many objects at a time upon which to center. We can not have too many articles of different kinds in the display window, show too many ladies' suits at the same time and get the value of their distinctiveness; have too many words in the head-lines. One at a time is safest, although it is believed that as many as five will not be overtaxing the power of attention.

DIFFERENT KINDS OF ATTENTION

There is the attention that we give to things without effort. While some one is talking to us, or we are doing something that is boresome, the mind is inadvertently dwelling on our last golf game, or dancing party, or on some problem that has been giving us trouble. The will has nothing to do with this kind of attention. It is sometimes called non-voluntary. Then there is the attention that we give to things in

spite of ourselves, as in the case of loud noises, violent contact with something or some one, bright flashes before the eyes, or experiences which are emotional in their effect, like the delivery of a telegram with bad news. This kind of attention is called involuntary. We give attention also by act of the will. We have a reason or purpose or desire for giving attention and therefore will or resolve to give it,—voluntary attention.

IMPORTANCE OF PERMANENT ATTENTION

It is possible to obtain momentary or spontaneous attention by such devices as size, motion, contrast, isolation and position. The full-page advertisement, the large sign, or the large store will attract attention. The mechanical man walking the street or the demonstrator in the window will get attention. The seven-foot man with the dwarf, on account of the extreme contrast will obtain attention, but probably only momentarily, conveying no message or meaning unless there is something to hold the attention. More permanent in its effects is novelty, which makes us ponder, associate, question and think. Figures, forms and arrangements producing bizarre effects, the un-

usual, unnatural, grotesque, clever spelling, unusual locations and positions, catchy names, jingles, media such as doves, kites, sandwich men, contests, puzzles, prizes,—these are all examples of novelty. Novelty must be rather negative than positive, not having the appearance of being forced on the public just for the purpose of obtaining attention.

Colors, in agreeable combination, have a lasting effect. We ponder over them. We favor one or another of the color schemes in our home decoration and furnishing. Each of the favorite colors has its meaning. The red, and blue, and green, and yellow all have their significance.

An object itself should give the greatest attention value, yet if it can not be presented for explanation or demonstration, the picture of it will be important because many persons think in terms of pictures while others associate their ideas with words. In advertising the picture has become recognized as almost indispensable. Together with the head-line it obtains the attention of those who think in terms of either or both.

Activity or the suggestion of it has strong attention value. The salesman who takes us riding in the new car will overwhelm the atten-

tion with the complex activities involved in the riding. To one who rides in this auto there will be the panorama of scenery for the eye, the fresh and invigorating air for the nose, and the muscular sensations of speeding through space comfortably. The salesman who lets us use the dictaphone brings action home vividly and obtains and holds attention. The demonstrator in the window, the moving barber pole, even the man working in the street or on the building obtains attention. Not being able to have the actual, the advertiser uses the illustration and wording to suggest action. The comic, like the novel, if not obtruded for the purpose of obtaining attention, will be found paying well at times.

FEELING-TONE AND ATTENTION

We will remember that some of the many stimuli that pass over the nervous system to the mind, in addition to arousing mere sensations, go so far as to give rise to certain processes of feeling. We feel their agreeableness or disagreeableness, their pleasantness or unpleasantness. This element of feeling is a moving process, impulsive in its nature. It is an attribute of sensation involving its durability,

quality and intensity, and is called feeling-tone, or affective tone. Every article of sale that we present to a person actually or in word and picture, will have its pleasant, or neutral, or unpleasant feeling-tone. The presence of a rat is accompanied with an unpleasant feeling, while the presence of the dove is distinctly agreeable. Even the lines on the automobile will have feeling-tone, as well as the lines in the advertisements which we prepare. Good lines, harmony and balance will be necessary for good feeling-tone in window display. Disagreeable color combinations produce unfavorable feeling-tone.

APPEAL TO INSTINCT

Appeal to a fundamental instinct has strong attention value. All human interests, forms of human desire and types of human emotion spring from them. Appeals to love, hate, grief, anger, fear, ambition, envy, shyness, embarrassment, sorrow, gratitude, acquisitiveness, curiosity, imitation, jealousy, modesty, play, rivalry, sexual love, sociability, self-preservation, and other fundamental instincts or states of feeling and emotion springing from them, will have within them that something which

not only brings attention but results in interest and action, as we shall see in the separate treatment of the interests, desires and emotions soon to be given.

THE APPEAL TO HABIT

The instincts, education and experience develop in us certain habits, in a general way common to all. We may have differences in the performing of habits; may put on the right shoe first, dress in certain order, read a certain part of the newspaper first, eat in a particular way, shave according to our peculiar method, yet we all have the general habits mentioned. Some read extensively, prefer certain kinds of reading perhaps. Others read very little. Some women will knit and others can not or will not. Habits are formed in connection with our mental as well as physical life. We form mental habits of doing things, like figuring in a certain way.

Gillette made millions by appealing to the habit of shaving. Publishers have built up great concerns on the strength of reading. The newspapers have large sections of classified advertising on the strength of the habit of exchanging, bargain hunting, etc. Smoking is a

habit the appeal to which has built up the wonderful tobacco business of the world. We have been impressed with the power of the appeal to drink. I know of nothing that belongs more distinctly to the habit class than chewing, either tobacco or gum.

If we are to have attention therefore we must look to intensity,—not only in lights and noises and similar stimuli which may be only momentary in their effect, but in the salesman himself and in the sales manager,—his speech and actions and letters should be surcharged with intensity. The relation of the article to the buyer's interests should be brought out. Every possible means of distraction should be overcome. A focal point or center of interest should be provided giving attention the opportunity to flit from place to place and with each change of position obtain a new and reinforcing impression of what we are trying to drive home. If we will be reasonable with attention, letting it center on a few things or groups of things, we shall obtain the best attention value. Novelty when not overdone can do much for us, and color will always play well. Objects of sale themselves or pictures of them have stronger attention value than mere descriptions of them. Then plenty of action is always good.

Feeling-tone is almost fundamental; and appeal to interests, motives and habits no less important.

So important is the matter of obtaining attention that each sales manager with the aid of his organization works out a standardized method whenever possible in personal selling. In house to house canvassing this works very satisfactorily. You have heard how certain companies have had their salesmen secure attention and interest in fixed ways; tearing the paper wrapper from the can of syrup, handing the can to the woman at the door and then placing himself in such a position that he could not take back the article conveniently until he had finished talking, all tactfully carried out with the idea of getting and holding attention. Take the electric hair clipper now on the market. Careful study on the part of the sales manager may have convinced him that the most satisfactory way to secure attention and eventually sell this article is to obtain permission to install it for a reasonable length of time and let it sell itself.

WAYS TO AROUSE INTEREST

Interest is a secondary mental activity following attention. We must first obtain the at-

tention, then possibly the interest will follow. It is attention with some degree of concern. Whatever will arouse interest is bound to get attention, yet whatever will get attention will not necessarily arouse interest. In a general way, what are the interests? In the young person the interests are centered largely in play, involving toys, games, athletics, hunting, eating and drinking, clothes, collecting and saving; later, dancing, friends, camping and other activities incidental to indoor and outdoor life. Education later becomes an interest, and with it vocation and future welfare. As the individual develops, the social interests continue, and the vocational interests begin to center on business, profession, or other work. About this time the interests in the special tastes or talents will become stronger,—art, music, writing, designing, etc., taking a prominent place in the person's thoughts. The interests begin to turn to individuals at this period and center themselves around mating and marrying. These interests will include the home, its character, locality, the family, and the activities of the different members as they come. And so we find that different conditions and circumstances give rise to different interests, many of

which are common to all while others are common to certain classes or groups.

Things are interesting which provoke emotion, such as joy, surprise, reverence, hope, gratitude, and feelings with emotional coloring such as pride, love, the moral feeling of obligation, and faith. The strange if not so strange as to become meaningless has interest value. The things with which we are most familiar, the routine of our lives especially when reflected in new ways, is interesting, the work in the home and the methods of doing it, the routine of the office, the routine of teaching or other work, farming, mining, railroading. Surely there is interest in what we desire, there is interest in what appeals to our habits. There is strong interest in the things which we may have a tendency to emphasize, such as art, music, dancing, golf, horses, cards, racing, swimming, and other athletics.

Professor James (*Psychology,* page 193) sums up the situation regarding interests substantially in this way: "..that each mind's appearance on this earth is conditioned on the integrity of the body with which it belongs, upon the treatment which the body gets from others, and upon the spiritual dispositions which lead either to longevity or destruction. Its own

body, then, first of all, its friends next, and finally its spiritual dispositions, must be the supremely interesting objects for each human mind."

Some articles of sale are in themselves sufficiently interesting to obtain consideration. The aeroplane and the wireless machines, on account of their novelty, will attract crowds of interested individuals. Other articles, not in themselves interesting, must be associated with the interesting. To obtain interest in cement it must be associated with interesting construction work, wonderful dams, factories, business blocks, homes, or unusual engineering projects. Interest in asphalt is brought out in the fascinating story associating it with the perennial sunshine of the tropics which for centuries has seasoned this product as only nature can. Coffee, in itself uninteresting, when placed in the display booth in an environment that is appetizing, becomes interesting.

Business is the center of interest to the business man. Examine it and you will find that it will boil down to the problem of make and save. Acquisitiveness is the explanation. Show the business man how to make or save; how to overcome competition; how to keep down outstanding accounts; how to put a business on a cash

basis; how to construct plant buildings economically and efficiently; how to create a demand for his goods; how to advertise; how by frequency of turnover to increase profits even though the profit per unit be less; how to do the hundred things that other business men do to make or save, and you will get him interested.

DESIRE AND ITS PLACE IN THE SALES PROCESS

Desire has relation to the future, what may or can be, and therefore depends on the imagination, the only means of reaching the future in thought. In desire there is a consciousness of want together with the impulse to get what is wanted. There is an accompaniment of feeling with it that is either pleasant or painful. If we desire to accomplish something, there is the feeling of pleasure in trying. And so in the desire to aid some one, for example, there may be the painful accompanying feeling in the knowledge that the some one is in trouble. The very exercise of volition, which is the next step in selling, hinges on desire, the impulse of desire leading to effort and action. For this reason desires are called motives. Some desires arouse deliberation and thought and are called rational. We desire power. To obtain

it requires the most careful thought and effort. Other desires are unintelligent, not arousing thought, resulting in action by reason of their accompanying impulses. In hunger, thirst, curiosity, anger, parental affection and the like there is accompanying impulse or prompting to satisfy desire. These tendencies, or propensities, are called mental or psychical instincts because of their coordination with the physical and psychophysical instincts. This prompting or impulse of desire is either selfish or altruistic, the desire to take for the benefit of self, or to give for the benefit of others. The group of selfish desires has a physical or mental basis as the list will indicate. Included in the list are food, drink, sleep, sex, movement, living, pleasure, property, knowledge and power. Under the altruistic group are such as the desires toward kindred, friends, country, mankind and God. (See Davis, *Elements of Psychology*, p. 294.)

We recognize certain needs of mental as well as physical life and desire to satisfy them. The desire to continue in life is instinctive yet involves mental action in satisfying the desire. Life is sweet and dear to us and when threatened makes the desire to live override everything. There is a universal desire for pleasure

which is accompanied by the plan and effort to secure it. Other forms of desire are acquisitiveness, ambition, sociality, imitativeness, emulation, approbativeness, affection, including love and hate. Then springing from affection we have pity, kindness, gratitude, reverence, love of kindred, including conjugal love, paternal, maternal, filial and fraternal. By association these are centered in love of home. Friendship gives rise to the desire for fraternal, club and church life and societies. Patriotism is love of country. Philanthropy is the love of all mankind, and piety is the love of God.

Desire is effected by environment and circumstances. The desire for food or drink is effected by the character of surroundings. The advertiser of meats is careful regarding the effect of environment, so very careful that he keeps the idea of the animal itself entirely out of the advertising, or idealizes it and its surroundings to prevent unfavorable suggestion. The retail dealer is careful in the display of foodstuffs, candies, drinks, etc., giving them a pleasing environment, above all,—clean. And so it is with sleep. If the environment is not pleasing we go elsewhere. That is why the hotel lobby is regarded as the most important

part of the hotel structure by some managers, who may be making the best of a bad situation.

We have found that everything that is interesting has attention value, but that not everything with attention value is interesting. We find again that the group of desires is interesting, but that the group of interests does not correspond with the group of desires. Many things that are interesting may not be desired.

VOLITION IN SELLING

Reflex, instinctive, or emotional movements are not dependent on the will. These movements take place without deliberation or thought. Many other actions result only from operation of the will, and these are called voluntary. Through the reflex and instinctive movements we first learn the movements that afterward become voluntary. The essence of voluntary action is the resolve or consent to act; what James, Angell and other psychologists call the *fiat*. We resolve to have the apparent consequences of an act become real, and actual. We resolve to purchase a suit of clothes because of the consequential condition of good appearance. There is a period of unrest, of indecision in voluntary action in which some of

the arguments or considerations involved in the sale, block it, while others invite it; a period in which there is a constant conflict of motives, some standing out strongly at one moment and others predominating at another moment, and all motives in the background of consciousness having their encouraging or inhibiting effect. Sometimes this condition keeps one oscillating for months in favor of a certain decision and then against it.

The actual presence of articles of sale, or the thoughts or representations of them, will start action of some kind. The possible pleasure or pain which this action will bring will add impulse to or inhibit action. If a movement is agreeable we wish it to continue and if it is disagreeable we want it stopped. Instincts have much to do with action; whatever appeals to them will have a tendency to produce action. Whatever appeals to the feelings and emotions will produce action, there being great impulsive power in such emotions as love, terror, rage, etc.

Holding the attention to the very last is necessary for action of the will. Continued or determined presence in consciousness gives or takes impulsive power. Articles of sale, arguments, advertising, sales letters, must all remain constantly interesting, continuing to be

pleasant to the very last, continuing to dwell on the great group of interests, continuing to appeal to the feelings, habits, motives and emotions. This attention must dominate, with no other ideas to displace or inhibit it, no reasons for action to the contrary. This volition is expressed by such motor response as writing out the order, signing, requesting shipment or some other significant act.

Professor Angell (page 345, *Psychology*) says: "Volition as a strictly mental affair is neither more nor less than a matter of attention. When we can keep our attention firmly fixed upon a line of conduct, to the exclusion of all competitors, our decision is already made. In all difficult decisions the stress of the situation exists primarily in the tension between the ideas representing the alternatives. First one and then another of the possibilities forces itself upon us, and our attention will not rest for more than a moment or two upon any one."

The modern business man is careful to eliminate all distraction. The retail dealer invites the prospect into a separate room or booth where there is the greatest opportunity of centering and holding the attention. Since the stress of the situation exists in the tension between the ideas representing the alternatives,

the quicker we can bring the consideration to but one or two articles or propositions, the nearer have we come to action. After showing our line of suits, by exclusion it will be well to eliminate all but the one or two in which the person is most interested, finally reducing to one.

The imagination is important in volition. It represents by anticipation the consequences of the purchase. It takes us into the environment in which the article is to be used—in the home, on the farm, in the office,— pictures its adaptability to needs, its possibilities of giving the comfort and pleasure which is sought, of satisfying the buyer who must use it, beautifying the home which must be painted with it.

Volition is further conditioned on desire which gives the motive for choosing, and the cause for this subsequent effort of purchasing. Hence the importance of keeping constantly before the prospective purchaser the adaptability of the article for satisfying desire. An excerpt from a honey advertisement shows how the advertiser appeals to the desire to eat. "You've tasted things that 'simply melt in your mouth' with goodness. Try.....Honey—there's no taste—no flavor in the world like honey. Its rare goodness is due to the great care which

governs every step in its production, grading and packing—from flower, to bee, to you." I find the following in an advertisement designed to appeal to the desire to live: "The radiancy of healthful beauty....the irresistible fascination of a natural complexion lavishes the finest positions that ambition can desire." In the appeal to the desire toward kindred the insurance man says: "Here, sir, is your opportunity to keep poverty from the threshold of your home after you are gone. Your wife and children must be protected."

In connection with volition it is important to consider a class of movements which do not depend on volition but follow from the mere thought of such movements. Action of this kind which results immediately and unhesitatingly without the interjection of what we call the fiat or resolve, is what we have already described elsewhere as ideomotor action. While we are talking to some one, he takes out his cigars, hands us one, lights one and smokes without interruption. While reading a book one takes out one's watch and tells the time. Walking, playing the piano, driving the car, seem to require no distinct impulse of the will. When we read such commands as, "Sign and return this coupon to-day" we often obey.

There must be nothing to hamper this kind of action. If unhampered, suggestion becomes very effective in obtaining results.

THE POWER OF SUGGESTION

What do we mean by suggestion? It is a hint, an insinuation, calling up one idea by the use of another associated with it, bringing indirectly before the mind an idea by partial statement, incidental allusion, illustration, question or the like. It is based on ideomotor action. Due to the fact that suggestion works from the sensory to the motor end of the arc without being complicated or delayed by deliberation and the will, we call it an appeal over the short circuit. It is an appeal to personal interests, motives, personal habits, emotions,—fundamentally to the instincts. We have it exemplified in the store display, in letter-writing, advertising and personal selling. The manufacturer says to the retail dealer: "You have not overlooked the importance of having your cement bins full for the great spring business." In the display window there is the symphony in brown, dresses, hats, veils, shoes, hosiery,—a complete suggestion for the woman who will be up-to-date. The advertiser pictures "The

Ham What Am" in the center of the picnic lunch, or places the golfer on the green in action with a Hole-Out putter.

We have respect for advice if it comes from one in whom we have confidence. It is so with suggestion. The prestige of its source has much to do with its power. Reliability, reputation, age and such qualities are important.

Suggestion may not have its effect immediately. Very often it must be repeated and given variation. In order to get attention, the suggestion, like letters and advertising, must have intensity and force and vigor. If it has not the interest and attention value it is worthless. It must be striking; must come again and again from one angle and another; appeal to one interest or motive and another.

Like other conveyances of appeal, these suggestions must be in harmony with established customs, habits and belief. We can not suggest high priced articles to the working man, nor low priced apparel to the assumed connoisseur of fashion. We can not offer German made goods openly. Rather what people need and want and what will appeal to the regularly established habits and customs is what should be suggested. As Walter Dill Scott says in *Influencing Men in Business*: "In in-

fluencing men, logically reasoning is never to be used alone. After arguments have been presented, skilful suggestions should be used as a supplement. This supplement often changes threatened defeat into success. The skilful pleader before the jury, the wise politician, and the successful superintendent of men, all alike are compelled to resort to suggestion to supplant their arguments in their attempts to influence men....The general public responds more readily to suggestion than to arguments."

A sale is not made until the order is placed. At this period when the arguments have been presented and the person is yet undecided, suggestion works most effectively, the right act or word bringing the results. These suggestions are made by writing out the order, handing it to the person for signature, asking how he prefers it sent, wrapping it, asking for permission to wrap the article, handing a pen or pencil for signature, thanking him with the assumption that the order has been placed, talking and acting with this assumption like handing him the cigar. To-day I was shown two tires that did not appeal to me. I expressed preference for two other tires regarding which I had previously talked to the proprietor of the store. After expressing approval of my inclination to

make the purchase, the salesman immediately brought two tires from stock to the desk in the office, wrote out an order and handed me the pen without further questions or arguments. I signed the order.

THE SALES ARGUMENT

Preparing the sales argument is a process of standardization. The very fact that we are interested enough to prepare a sales talk is sufficient proof that we are looking for the best. We have just examined the different stages of the selling process. With these constantly in mind we can frame our sales talk, and this applies to the salesman at retail as well as at wholesale. Selling at retail as well as at wholesale has got to the point where scientific methods must be used. Special preparation, in many cases in the special school, is now being provided by the large retail establishments.

Study and experience in the sales of an article enable the collecting of data for providing the most scientific methods of selling. Possibly we shall begin by standardizing the very introduction. We study our article; we experiment with it and find that we obtain the most satisfactory results by letting the sales-

man introduce himself in a certain way. For the time being and until something better can be established, this, then, is the method that all salesmen will follow. Since the great wave of standardization swept the manufacturing or operating end of the business world there has been a strong tendency to extend its principles to every branch of business. We find our selling organizations taking over the principles of efficiency framed and adopted by such men as Taylor, and applying them to the management of sales and other departments. After having demonstrated their pulling power on the few, letters are sent out to the many. Their work is keyed and preserved for future reference. If they do their work well they are used as a basis for others to follow. In our schools of salesmanship only what has been discovered as the best is being presented, the old and unsatisfactory being avoided and replaced by the new and better. Long ago the railroads found it advisable to standardize in every department, the standard code of operating rules and the government's standards of specification in the construction of equipment being classics in this line.

Standardization therefore means being fit, properly prepared, equipped and qualified. It

substitutes good dependable knowledge for imagination, supposition and guess. It affords the strongest, most forceful, most impressive method of presenting the sales proposition. That great clearing house of ideas and experiences, the sales office, becomes a storehouse for the best. The reasons for successes and failures are recorded there, and all of the statistics and other data from the field or shop.

We need not worry over the possibility of its destroying the individuality of the salesman. If he is a salesman the talk will not be unnatural and over his head; not like a recitation. It will be assimilated to be expressed in his own way; elastic and adaptable to any case, with a talk for the small-town dealer and another for the banker of the large city. The standardization will be of thoughts and methods rather than of language, and yet with the language at its best. Each selling point or argument will stand out in a paragraph or series of paragraphs, having its logical relation to the entire argument, thus enabling the salesman to adapt his talk to the conditions prevailing. Some buyers, due to good advertising, are almost sold when we reach them. The entire argument would be a bore to them. So much for standardization of the sales talk.

Now how shall we prepare it? First we must determine what we wish to establish, then gather the material for proving this; take this material and arrange it in satisfactory manner, and provide for presenting it in the best of form. The company has designed and is making an article that it believes supplies a certain need. It is a light tractor that will do everything that any other tractor will do and more. This, then, is what the argument should aim to establish. Here is a bed designed to have wood for beauty and steel for strength, a good combination. This may be the thought to be established. Here is a table service designed to appeal to the clever woman who is distinctive in her demands in this respect. On articles that are well known, like kitchen utensils, a talking point like endurance may be the only idea to establish, with all of the qualities possessed by it that other articles possess being brought out incidentally. Special qualities of this character are brought out even in the trade-mark, like "Wear-Ever" for example. The magnitude of the proposition will determine the character and extent of the proof and the method of presenting.

If the sales talk is to be scientifically prepared we must observe the different stages of

the selling process. What shall be the method of approach and of obtaining attention? How can the laws of attention be applied to the proposition? After carefully scrutinizing our data, what do we find that will serve best to obtain and hold interest? To what particular desires must we appeal? Surely the character of the article or offer will have much to do with this. It is a case of bringing the buyer before us in the mind's eye, considering his equipment like the senses, instincts, feelings, desires, habits, emotions and special interests; his power of imagination, memory, reasoning and willing, placing our article or offer in juxtaposition and linking them together, with the buyer.

What is some of this important data? The man who designed or planned the manufacturing of the article had a fixed purpose; intended it to fill a certain need. Perhaps after it was produced it was found to fill certain other needs not originally contemplated. Whatever the case may be we must know uses and prove advantages and adaptability. We must know the article or goods and every detail regarding their manufacture. We must be able to handle the price question diplomatically, justifying the high price with quality which always makes price insignificant, or with the making or sav-

ing advantages, which far outweigh the objection. We must know our competitors and their products, their selling points compared with our own, because the buyer of to-day, professional or otherwise, is a man or woman who compares. Service can not be overlooked, nor policy. Service alone sells many an article; policy many another. I have seen trainloads of material loaded and kept ready for billing to buyers who needed special service, and I have known of sales managers who have traveled for many a month in order to get the pulse of the trade regarding policy. Not until we can convince a dealer that there is a community of interest that is virtually equal, between him and the manufacturer or wholesale dealer, have we a policy;—not until he feels that our interests are his interests, and his interests are our interests, and that the manufacturer and dealers are all members of a great business family working together.

REGARDING OUR ENGLISH

How important in the business world is money, the great medium of exchange of goods, etc., and yet how important is language, the medium of exchange of thoughts, and knowledge.

In selling we are constantly making contracts, representations; describing, explaining, appealing, educating to the uses of our product, constantly using English. The spoken word of the salesman and the printed word of the advertising man are the only satisfactory means of communicating these descriptions and appeals and arguments. If our selling is to be at its best our English must be at its best. The sales talk must have its attention; the language of the salesman must be good; the language of the office must be good. Language has much to do with feeling-tone; it leaves a good or bad impression. No less important than impression is the matter of having what we have to say conveyed in good clear language. Misrepresentation is frequent but honest, perhaps, because the English is not clear. We failed to convey clearly to the buyer the idea fixed in our own minds. Unless our English is clear enough to make our minds meet squarely on a proposition our selling will be deficient. Needless to say that our ideas must have relevancy, bearing directly or indirectly on what we are trying to convey, and our English must be charged with that element most advantageous in selling,—force.

With a superficial knowledge of their pro-

fession, men will be successful because of their command of English. They may know little law and yet have good bank-accounts because they talk well, especially before a jury. Their English gives them a veneering beneath which the great public does not seem to go. It gives a valuable finish which can be lasting and genuine only when knowledge and character are beneath.

Why not start in by eliminating most of the slang, if we would improve? When we get it from every salesperson, every mechanic, every farm hand, every schoolboy, it becomes cheap and monotonous. It gets a little rusty and trite to hear every one designated as a "bird" or a "guy." Why not eliminate the profanity so freely and so generally used by many salesmen that it becomes tiresome and repulsive even to those who must themselves use it occasionally, and has surely lost its force? Why not obtain good elementary works on English and study them? Then let us study the English peculiar to our line; let us know its vocabulary. If the advertising department has a supply of good catchy words or phrases let us make them our own to use in personal selling as well. Surely each salesman can study his sales talk and improve its English.

CHAPTER IV

THE SALES DEPARTMENT

A WELL-KNOWN sales manager formerly of Denver, now in New York, when hiring a man tells him that he expects the salesman eventually to equip himself for stepping into the sales manager's position. He wants his men trained and ready to go higher when the occasion demands. In every good organization it is the desire to select executives, whenever possible, from within the ranks. The salesman therefore can not afford to draw a well-defined circle around his position and say that he will do only so much and no more. He must acquaint himself with the work of his superiors and with the positions possible of attainment in his particular line of work. Instructions like the following come only to those who are prepared: "We shall expect you to go to Blank, establish suitable sales offices, hire the salesmen necessary, train them, assign them to territory, and obtain a market for this product. You will supply yourself with assistants and other necessary help,

arrange for the purchase of all equipment including furniture and fixtures, printing, bookkeeping, quoting, invoicing, collecting and banking. We shall hold you responsible for all money collected and paid out. The entire sales organization, offices, men and equipment will be turned over to you to get results." Here we have a bird's-eye view of the work of the sales department.

THE SALES OFFICE

The location of the office is important. A sales manager and his office must be in constant touch with his salesmen. The necessity of their getting back and forth to and from the sales office as frequently as is necessary must be kept in mind. Equally important is the possibility of contact with the trade itself. Buyers, dealers and the public have business of one kind or another much oftener in the larger centers than in the smaller ones. The shopping facilities, higher standards of professional men, the hotel and railroad accommodations, theaters and other attractions bring the public to the large cities. Manufacturers and jobbers realizing this locate their offices in these cities. The modern buildings, well-located, modern of-

fices, mail service, the possibility of obtaining efficient help, of getting different kinds of service incidental to the large office, purchasing, contact with credit agencies and associations, banking facilities and living conditions all make the large center the one generally selected for the location of the sales office.

THE SALES ORGANIZATION

Needless to say the size and character of a sales organization depend on the amount of territory involved, and the intensity of consumption per capita of the article being sold. In some lines of business the volume of consumption per capita and the resulting sales run very high while in others they run low. Where they run high it is necessary to have great organizations centralized at some important city with many branches or district offices located at strategic points in the territory served. The greater the organization the more specialized and delegated the work becomes.

An organization is not an organization when there is no carefully outlined plan of jurisdiction of the different departments. The sales department can not be usurping the jurisdiction of the operating or traffic or auditing de-

partments; nor can any one of these overstep and interfere in matters rightfully belonging to other jurisdiction. A general manager should have jurisdiction that rightfully belongs to him. To him should report the head of every department, including sales, traffic, auditing, operating and other main departments, but not those which are interlinked in an auxiliary way with one of the main group. The advertising department may in some cases take the place of the sales as in mail-order business, in which case the department should report to the general manager. In the case of advertising generally the jurisdiction should belong to sales. Being closely associated with and bound up in the work of the sales department the best results can not otherwise be accomplished. The work of a traffic department is generally so well divided between all other departments, that no one can logically claim jurisdiction except the general manager. And so with the auditing; its work is divided between all of the departments, sales, traffic, operating and advertising, and it rightfully belongs to no other officer than the general manager. So far therefore as the sales department is concerned it should claim no more than careful and willing cooperation from other departments, and

should have entire jurisdiction of the advertising only when the work of this department is in nature subsidiary to it.

In the district sales office immediate authority must be given the manager which may involve supervision of the bookkeeping traffic, credits and collections, and banking, yet the jurisdiction should remain in these departments in the general office. Directly within the manager's jurisdiction should be such departments or branches of sales work as territory, hiring and discharging salesmen and office help and training thereof, office records and reports, councils, meetings, letters and bulletins, all of which will also be a part of the work of the general sales office. To the general office will also belong such work as publishing the house organ, planning and trade promotion, quotas, contests, conventions, expense accounts, advertising, in fact all work which can best be done by being centralized in the general office. To the district office will be delegated only that work of immediate consequence to that office which can more satisfactorily be taken care of by it rather than the general office.

RECEIPT AND FILLING OF ORDER AT WHOLESALE

The sales department, having charge of the marketing which includes the solicitation, advertising and delivering, must have its way of presenting orders to the plant for filling according to specifications. I have heard sales managers claim that the shipping department at the plant should be under the jurisdiction of the sales department. I have heard others contend that it is distinctly under the operating department and no more than proper cooperation should be expected. The routine of receiving and filling an order will throw light on the reasonableness of each claim. By letter or wire or phone, an order comes to the sales office, always confirmed if it is phoned or wired. Acknowledgment is then sent to the customer, and the copy and the original order sent to the order department, numbered and written up on a regular form to be sent to that plant concerned. The original of this order to the plant is filed by the shipping department at the plant and the copy retained by the sales office. All orders are accepted subject to the approval of the sales manager and the credit department. They are therefore approved by the departments concerned before being sent to the plant.

The shipping clerk has charge of the orders after they reach the plant and is subject to the instructions of the sales department in taking care of them.

REPORT OF ORDERS SHIPPED

On instructions from the sales department, the shipping clerk at the plant lays out the loading program for each day. As the cars are loaded, bills of lading are prepared giving a description of the shipment, the name and address of the consignee, routing, etc., which bills must be signed and accepted by the local railroad agent in authority. A report is then made daily by the shipping clerk showing the names of the consignees, destinations, descriptions of shipments, car numbers, weights and similar information, and sent to the sales department for invoicing purposes. If the district office handles orders direct, a copy of this report goes to the district manager and one to the general office for checking purposes. From this report the sales department, after making proper extensions, inserting rates, prices, etc., prepares the invoices. The invoices are mailed daily to the different consignees reported. Usually some incentive is offered for prompt

payment of bills, and the invoice allows a discount for cash received within a certain time, usually ten days, and also provides a final period for net payment.

SALES OFFICE FORMS AND RECORDS

A sales manager must keep constantly in touch with the business that is done, determining where it may for some reason be decreasing or where it may be increased. The nature of the business will have much to do with the detailed character of the records to be kept. The salesman, being the man on the ground, should be able to furnish and keep constantly up to date, records that are indispensable to the sales office. Generally speaking, such information as the following is valuable; name and address of the dealer, the name of the owner or manager in charge of the business, the brand or brands handled, what his volume of sales normally runs, the quantity which he has on hand. It is well also to mention quotations made in order that these may be checked. When a dealer may be in the market again should be reported. His attitude toward the salesman and his company should be known. Any claims or cases of dissatisfaction should be carefully investigated

and reported. The prospective business in the territory, such as proposed construction, is welcome. The salesman can make his report a perfect barometer of conditions in the territory which will enable the sales department to follow up all cases of dissatisfaction, all prospective business or other detail that may need attention from the office. In this report the salesman can ask for whatever cooperation or information he may need, and make any suggestions that will enable the different departments to give the customer or prospective dealer the service that he should have.

The reporting of shipments furnishes a valuable record. Suppose that we have a record of each customer giving such details as dates of shipment, factory numbers, car numbers and initials, routing, quantities shipped, the dealer's order numbers, prices per unit, freight rate and destination. Such a record gives a graphic standard for future use.

The route sheet is indispensable, acting as a saver of time and expense and having statistical value of importance, enabling the sales manager to obtain such information as the number of towns and dealers called upon per day, the average expense per call and the average time spent with each dealer.

Some companies find it profitable to prepare these route sheets in the office, while others leave the preparation to the salesmen.

The tickler or follow-up system of the sales office is very important. Matters which should have attention periodically or at special future dates are placed in files to be returned when needed again. At the suggestion of the salesmen and with their cooperation many special letters, or advertising must be sent out at certain times to certain persons. The follow-up system brings all of these matters before the sales manager daily for his attention.

In the sale of certain kinds of material, like building material, it becomes necessary to protect the price until a job is completed. This is done by contract. These contracts provide in substance that regardless of any changes of price in the market, the material for the work described will be furnished at the price fixed in the contract. This enables the contractor to bid on work at fixed prices. For some time after the war there was a strong tendency not to protect prices in this manner. Contractors were forced to go into the open market and purchase for the owner of the building at prices prevailing, charging a certain commission for their work of construction and supervising.

These contracts and the records and reports of shipments thereon are important to many a sales manager. He must know that the material which he has contracted to furnish goes into the work for which it was contracted and is not sold on the market which may in the meantime have advanced materially. It is needless to mention the convenience and necessity often of such articles as good maps and charts and the accessories for marking and changing them from time to time with information valuable to the sales office. Companies now specialize in this line of equipment and have many things to offer.

HIRING SALESMEN

Is there a man in the business who can interview a salesman for a reasonable length of time and on the strength of what he claims to be his knowledge of men, judge him correctly? There is not! Hiring salesmen is important and it takes time. If we are to have the men with the characteristics which have been dwelt on in the first pages of this volume, we can not hire on a single interview, nor on the judgment of one man. We want our salesmen to have personality, to be able to command attention, make the customer listen and think and do.

We want them to look well, to have a pleasing manner, use good language, be tactful, energetic, honest, to pronounce and articulate well, to be active yet easy, sincere yet cheerful, thorough, resourceful, original, and to have initiative. These men can not be selected in one interview.

TO THE SALESMAN APPLYING FOR A POSITION

Let me say to the salesman who may be reading this volume, that he must be able to demonstrate his qualities in applying for a position. The greatest mistake that applicants make is in failing to realize that their purpose in applying is to try to sell their ability and service to the sales manager. Many of them never come back a second time. Hopeless would they be as salesmen if they were to carry out this practise. Give the sales manager plenty of opportunity to judge you. Some men make a good first impression but do not wear well; others, like good wine, get better with age. If your history is good tell it. If you have had to fight to get along; struggled for your education; "plugged" along since you were a boy, tell it. Prove that your habits are good; that you are conscientious, desirous of learning, industrious, wanting to be doing something worth

while instead of gambling and drinking or otherwise amusing yourself. Come down to brass tacks quickly in your conversation. Be earnest, enthusiastic, meet objections as well as possible. Watch your voice and language, and be a good listener as well as talker. Sales managers look for character. They want the man not only with the ability but who is willing to work, honest, economizing to a reasonable degree in his expenses, looking after the interests of the company as if they were his own; not leaving the field on Saturday for a long trip to his home and losing that Saturday's business; not leaving home on Monday morning for the field and losing that Monday's business. They want the steady fellows, the grinders who can show steady increases, persistent, willing to learn and obey; honest and loyal. Those men will go higher; you can not stop them.

Even the matter of hiring can to a certain extent become standardized. By the experiences which we have had in the past we learn what to look for and avoid in the future. The forms of application should be sufficiently in detail to get an expression from the salesman on important matters, bringing out not only such details as personal history, experience, and other information called for in the usual stereotyped

form of application, but serving as a kind of brief preliminary examination of the salesman's qualifications for the position.

The nature of the sales work required will have much to do with the character of the men to be hired. Some organizations regard their work of sufficient importance to insist on having none other than men who have had college or university training. This is said to be the latest policy of one of the largest plaster and plaster specialty companies in the country, which company has also taken a great step forward in the training of the men already in their employ. Companies insisting on standards as high as this are necessarily in position to offer inducements for retaining such men in the future. Here is a step toward standardization in employment of salesmen that will be followed by others just as important. Some companies have in the past preferred to hire salesmen who were technically trained, but have not insisted on this training provided it could be later acquired.

THE TRAINING OF SALESMEN

Fifteen years ago or longer, one could step into the offices of the transportation department of any city railway company and find a

department for training motormen and conductors and other employees. On the platform of the instructor would be a controller and possibly the front and rear platforms of a car if not an entire car. The general appearance would be that of the lecture room of the university. Every man who expected to take a position was compelled to take a course of instruction, and after being employed to keep "brushed up" with lectures, demonstrations, etc. Written examinations were required by some companies before giving employment. Hypothetical cases were presented for the applicants upon which they were to pass judgment. Since that time we find special instructions being given in almost every line of business, in every department. Manuals, some of which are as comprehensive as a complete course in business study, primers, bulletins in series, house organs, conventions and other means are all the result of this idea of giving proper instruction to the salesman. Bulletins serve to keep the interest alive, and to present facts that are timely and of immediate importance. Many of the smaller organizations depend entirely on bulletins to keep the salesman instructed. Very complete correspondence courses are now being given by some large

concerns to their employees. One of the largest gypsum companies is in this manner instructing its salesmen. Such subjects as building plans, reinforced concrete construction, plaster and plastering, are taken up and written examinations periodically required.

WORKING WITH A DEFINITE AIM

A definite aim or set task, a pace like that demanded by the athlete, makes men do better work. Let the quota be set for comparatively short periods like weeks or months rather than years, and the spirit of rivalry will bring much better results. We are born with an instinct for combat and rivalry which explains the success of contests, quotas and other means of stimulation. But there must be prospective gain or reward, without which effort to make quota or win contests is as uninteresting as poker without money to a professional gambler.

Just as important to the success of the contest or other set task is life and action, vividness and realism. This demand is met by letting the organization represent ball or rowing teams, horse races, football and other popular sports. The scores of the salesmen accompanied by a newsy bulletin are sent out periodically,

interspersed with wires, personal letters, telephone calls, etc., to keep the men thoroughly in action. The value of a contest was brought home to me a short time ago when the salesman of another organization selling advertising specialties had been calling on me for a large order of Christmas greetings. He worked incessantly for several days and finally, upon landing the order shook my hand and said most enthusiastically: "There, that puts my bunch in the lead again. We have a big contest on and I could not leave the city without your order."

Establishing bonuses is very common practise in all lines of business including retailing. In most cases it is comparatively easy to fix the basis of the bonus and in others it is difficult because of the nature of the business. In the cement business it is difficult to establish bonuses because we can not point directly to the amount of tonnage for which the salesman is accountable and should obtain credit. The cement company builds up a fixed line of patronage, the dealers once buying the brand continuing to do so exclusively until they find good reason to change. Their orders come mostly by mail. The business which develops is often unusual especially in the large cities where

great constructive programs may be in progress. The point system seems to be the only satisfactory way of applying the bonus in such cases. Certain points are allowed for certain good work done, each point representing a fixed amount of reward, as one, two or three dollars. This gives a flexible system by means of which the salesmen can be encouraged to improve in different ways in which they may be lacking or weak. For any negligent omissions or commissions, deductions may also be made provided their total does not affect the amount of salary allowed, should the deductions be more than the total amount of bonus accumulated. Such a system makes it possible for the salesman to make, with a perfect score, an additional amount of money each month depending on the size of the bonus planned. Good judgment on the part of the sales manager and the tendency to be rather liberal than narrow in the application of the bonus will keep the salesmen pleased and interested in meeting the wishes of the company in doing their work. Points of efficiency and inefficiency are constantly brought before the salesman, of which information he is bound to take advantage if he be reasonably conscientious.

MEMORANDUM OF BONUS ALLOWANCES*

	Points Allowed
Good appearance, cleanliness, courtesy and pleasing manner	10
Knowledge of selling, including knowledge of the company and its goods or proposition	10
General ability displayed in the field	15
Reporting and cooperating	10
Obtaining contract and other business for the local dealer	10
Economy in the expense account, routing and generally	10
Perseverance and thoroughness	10
Obtaining new dealer accounts and holding old ones	10
Other good work not mentioned but regarded by the sales manager as worthy of credit	15

For wilful or negligent failure to cooperate as outlined above, the sales manager reserves the right to make deductions equivalent to those mentioned. This arrangement shall in no way interfere with the agreement which has been made regarding salary. The bonus allowed is three hundred dollars maximum for the year, which until further notice shall be credited and paid quarterly.

*This system may be changed from time to time to suit conditions which may arise.

RELATION OF THE SALESMAN TO ADVERTISING

You have seen the illustration of the tug of war between two calves each after a pail of milk just out of reach. They tugged and pulled but neither got anywhere. Finally they decided to pull together with the result that they went first to one pail and shared it, and then over to the other.

Possibly an advertising campaign, in spite of the salesmen, will pay, but it will pay much better with their cooperation. Why should any salesman take a position against the advertising campaign? He can not afford to do it. Goods are often sold on the strength of proving to the customer that he is to be supported in his selling by a satisfactory advertising campaign nationally and locally. It has often been proved that advertising holds the old accounts and helps wonderfully to obtain new ones, many dealers refusing to sell articles which are not advertised even though they may have a longer profit per sale, because of the difference in frequency of turnover. Instead of increasing, advertising decreases selling costs by increasing tonnage or volume. When distributed over the entire output the cost per unit is very small.

This saving in selling costs gives an opportunity if necessary to improve quality.

If the salesman can show the dealer how to dispose of his goods at reasonably frequent intervals at a fair profit with each turn, he has produced a strong incentive for buying. Advertising provides this means. The manufacturer is constantly carrying on an extensive national campaign. By means of window display, cooperation from the sales force, and local advertising it is an easy matter to link the advertised product with the store of the dealer, and with a continuing campaign the two will become associated in the minds of the buying public. If I were a salesman I would be looking for every opportunity possible to get the local dealer to advertise my goods. I would want to have my place in his display window, and in the prominent and appropriate places in his store, with other goods that are associated with mine. I would want to have my place in the other advertising which the dealer does in the newspapers or otherwise, in the street-cars, circulars, letters, on bill-boards; in the heads of his selling force. I would encourage him to be a strong advertiser with all of the latest and best ideas. Such a program would help his sales as well as mine. Being the man

on the ground constantly talking with the trade I would feel that I ought to give the benefit of my experience to the advertising and sales departments by making whatever I regarded as valuable suggestions.

CREDIT AND THE SALESMAN

One morning a number of years ago, after spending a day's time and all of the energy and enthusiasm that I could get together, I succeeded in opening an account in an important city of Nebraska, the first that the company had been able to open there, after years of work. I was very much pleased, and a few days later walked into the sales manager's office believing that I had done the unusual. Among other matters he mentioned this new account with the following brief and cold comment: "I am sorry that we can not sell that fellow. His credit is absolutely worthless." Since that time I have not had to be told never to waste my time on a prospect that could not pay for what I sold him. We are building our selling ability on air if we do not realize the importance of getting the money for what we sell. Selling ability is not measured by orders so much as by profits. Profits and poor credits do poor team-work.

In some lines of business the credit risk is much lower than in others. Bankers and lumber dealers will be a comparatively good risk, while a cosmopolitan trade like that of the large retail store, will make the risk much greater. In any case the salesman must have a knowledge of the fundamentals of credit, and cooperate with the credit department to see that the company is protected. This requires thought, tact, good judgment, care and resourcefulness.

Let us see how the credit man opens an account. First he is very careful to get the correct name and address. There are so many people with approximately the same name that it is an easy matter to investigate the wrong person. The credit man regards as very important the personal interview in which in his subtle yet apparently innocent manner he obtains from the applicant such information as references, the name of the employer, if married,—the full name of the husband or wife, whether or not he boards or keeps house, the names of the companies with whom he carries fire or life insurance, the name of the savings or checking bank account and at least three references. If a salary is small it may be necessary to garnishee it; consequently the place

for doing this must be known. In this connection it must be remembered that the married man can claim certain exemptions in case he is sued for debts. If he has household goods, therefore, the credit man must know how much their value under forced sale exceeds the amount of the exemption allowed. Fire may destroy the goods in which event the policy protecting them would be garnisheed, which makes it important to have a record of the policy and its details. The credit man seems to consider his ability to size up individuals worth much to his success; he lays much stress on honesty and character and habits.

The single man is not regarded as nearly so safe a risk as the married who has more at stake, and is more stable and responsible. Some credit men, strange to say, regard many salesmen as poor risks; with the life insurance solicitor for example they include barbers, waiters, bar-tenders, Greeks, theatrical performers, book salesmen and any commission canvassers. We have always been ready to defend the credit of the high-grade salesman. The man who is sued often or who is looked upon as being reckless or extravagant in habits, who buys furniture and other articles on contract, or who has a judgment or chattel

mortgage against him is refused almost peremptorily by the credit man. If further investigation is desired credit reporting bureaus can generally give good information over the telephone. Then in addition to this the credit man often wants his own investigation. He follows up the references given, obtains the limit of credit given by other concerns and their estimate of the applicant's honesty and character; learns if the applicant owes them anything and how he pays; how long they have known him and dealt with him. He calls the employer and determines his salary and how long he has been employed and what he thinks of him. Then the credit man sends the investigator to the neighborhood, looks over his household goods to place a value on them, learns how long he has lived at the present place. He calls on the neighborhood stores and others who may appropriately throw light on his character and worth. In fact the honesty of the applicant is tested by investigating every claim that he has made in the effort to obtain credit. If everything looks favorable credit is extended.

The applicant for credit may be the dealer instead of the individual. The retail salesman is protected by the credit department. The salesman in the field has much more responsi-

bility since he is often called upon to open new accounts. What shall we learn about the dealer before agreeing to ship him an important consignment? We must have his history; his age, how long he has been in business, the character of his store or plant and its location. We must know about his stock, the quantity and character of it, and whether or not it is insured. We must know whether or not he is a good business man,—a good manager, good buyer, with good temperate habits, with no financial troubles that are serious, well thought of and recommended in the community, especially by other business men. Then we must know whether his business is progressing or standing still; whether or not he is methodical, keeping his books well, looking carefully after costs and expenses as well as profits. His pay-roll, rents, and other costs bear on this. Then it is important to know that he carries liability insurance if necessary because a judgment might put him into bankruptcy. If he has other interests or other property besides his business this helps his standing for credit. These are hints which may be of value to the salesman in determining the standing of an applicant. It is important to keep in mind the importance of cooperating with and receiving cooperation

from the credit department for the constant protection of the company.

WATCHING THE CREDITS

Credit risks which at first are very favorable may later become dangerous. If the salesman finds evidence of neglect in management, stocks are deteriorating, accounts are running heavy, the dealer is living extravagantly, drinking, having trouble with his family and trade, or if he is apparently getting ready to sell or leave, this should be conveyed immediately to the credit department. If he has been sued, or has given a mortgage on his property or done anything that might weaken his credit, this also is important information that should be given the office immediately. Attention to this matter of credit will bring out the best, most methodical ways of investigating each case. It is too important not to have careful study and alertness on the part of the salesman.

THE SALES CONVENTION

We can not make a vaudeville show of a convention, yet one of the first thoughts should be to make it interesting and full of action. Min-

gling with the serious must be something to relieve the monotony and tensity. Appropriate decoration, plenty of appropriate cards and illustrations, equipment that will serve for demonstrating, the moving-picture machine, music if possible, and the burlesque demonstration are features which are used to advantage. Sketches or playlets carrying out important ideas are effective. The burial of Alibi Ike by the Todd Protectograph organization and similar features by other concerns are never forgotten by those in attendance. Action is the secret, continued and varied, one feature after another. This means that the length of speeches must be limited, stopped with the gong if necessary. The leader must be carefully chosen. His personality may veil the whole affair with saffron if he can not enter into the spirit of the meeting in proper manner. Active participation in the program makes it more interesting. Having the salesmen themselves prepared and putting them into action is effective. But they must be prepared and limited in time or the work will be unsatisfactory. No convention is completely arranged unless provision is made for obtaining stenographic notes of proceedings and discussions and furnishing them to those in attendance.

SELLING BY TELEPHONE OR TELEGRAM

Some time ago I took charge of an organization that was new in certain western territory. Competition was keen and plentiful. Dealers in that particular line of business preferred to continue doing business with the one company, only, with which they had been dealing perhaps for years. To break into a field so firmly fixed in its methods of purchasing required most intensive work. The salesmen were doing their part, yet the unusual was necessary. Every day as the salesmen's reports were received they were carefully scrutinized and classified, and filed for following up. The result was that daily we were telephoning and sending night letters to certain dealers with some message based on the suggestion of the man in the field, or on the judgment of those in the office. The results were most satisfactory. I remember one sale of fifteen thousand dollars' worth of material that resulted from a telephone call, and a night letter that brought six carloads of business.

With the cooperation of the salespeople in the retail store a surprising amount of business can be developed by telephone if the matter is handled properly. Every salesman can have

his group of friends who will be glad to be called during quiet hours to be informed of a sale, or of the arrival of some new line of hats, dresses or other articles just received. The woman who likes to do the original in entertaining will be pleased to know that the first strawberries of the season are in. Instructions in the proper methods of handling the telephoning will be necessary and in most cases an understanding with the customer. It has its difficulties and yet can be developed into a very profitable feature of the sales work. The person at the receiver has much to do with the success of the plan. In many cases the sales manager himself will be able to obtain remarkable results when others would make no headway; in this respect, much like the power of a letter or suggestion, the effect depending on the weight behind the telephone.

THE SALES LETTER

The sales letter has come to stay as a fixture of the sales department. It is as necessary a part of the organization as the salesmen themselves. It has its place which can not otherwise be filled. Before the salesmen go into the field for a new company, the letter in series takes

its important place with the advertising, in doing the preliminary work. The salesman is relieved of all the work that can be done satisfactorily by the latter. Many companies depend entirely on letter-heads, and will not permit their salesmen to call on any one who has not been interested enough to respond. The letter and accompanying advertising in the trade papers obtain the attention and interest, and possibly desire. For many companies it even obtains the orders.

After business is established the letter takes its place on the program of cooperative work, intensifying the work of the salesman wherever possible. Regardless of how much argument the salesman may present and how forcefully, along comes the letter and folder perhaps with its stress on some important article which the salesman may have overlooked, making the appeal in another way, and from another angle, and gets the business. The letter helps to strengthen impressions that have been made, suggests things that the salesman has forgotten, refreshes the memory of what the salesman has said, and does it in a quiet, pleasing and forceful way. Many a letter can be sent by the sales manager himself to certain dealers or customers made as direct and personal as possi-

ble, which will have weight enough in many cases to obtain business that has not been otherwise obtainable. Whom to write, what to write and when, can be planned with the cooperation of the salesmen. Their reports will give special information possibly of a personal character and at least of special interest which can be taken advantage of in framing the letter. Possibly these letters can be prepared in groups for the many dealers who are reported in the same manner. Certain form letters made of selected and well prepared form paragraphs sent out with the sales manager's signature are frequently used. The purpose of the work must be known to the salesman who with proper instruction and understanding of the situation can give reports which will enable the framing of strong and pulling letters. We will say more about the sales letter in another chapter.

TIT BITS

For Thinking Salesmen

Mr. A. W. Ambrook,
Concordia, Kansas.

My dear Mr. Ambrook:-

Just a word this time about the dealer in the small town. If you have ever been in the

great redwood forests of California you have wondered where is concentrated the great strength that keeps these trees standing against the storms of time. Examine the roots, however, and you will find them of every size, large, small, long and short, interlaced and extending in every direction through the ground. One little root does not mean much. Taken together they keep these trees as firm as the hills that surround them.

One little lumber dealer in a small Kansas town may not mean life or death to his company. Let us have thousands of them, however, and a constant and dependable stream of orders will make the company as firm as the great redwood tree. Our experience with many other plants has convinced us of the importance of getting the little dealer into our great family. He has his place with us.

I know that you see the point, Mr. Ambrook.

Postcript: Can I be of any assistance to you?

TIT BITS

For Thinking Salesmen

Mr. Neal Burgess,
Hastings, Nebraska.

My dear Burgess:-

Have you a well planned way of keeping your sales talks vigorous and interesting? The

lumber dealer comes into contact with many different salesmen. Some of these are able to get business and others are not. Why, Burgess? Because some of these men stand out more prominently in the dealer's mind than others. Some have called on him time after time and made no impression; he does not remember them or whom they represent; is not interested.

If you can find a way to make your salesmanship stand out, separate and apart from the work of other salesmen; put your personality more prominently in the mind of the dealer than are the personalities of the other salesmen, you increase your chances of getting business. Enthusiasm may be dampened by monotony which creeps into the salesman's work if he does not study the means of keeping his talks vigorous and interesting. A weak battery won't start a car, or keep it going.

Your experience in the field and your thought on the subject will reveal to you things you might do or say that will make each visit a lasting impression on the minds of your dealers. The resulting interest will add impetus to your work and keep your enthusiasm at proper pitch.

Burgess, later you are going to say that this was a good suggestion.

TIT BITS

For Thinking Salesmen

Subject: *Making the Most of Our Limited Time with the Dealer.*

Dear Westergaard:-

If your spare time ever becomes a demoralizing drag on you something is wrong. Our records show that certain of our salesmen spend only a few hours of the twenty-four in actual contact with the dealers. The rest is spent in traveling, sleeping, eating and other ways. These striking figures are taken from the route sheets of the last year and are fairly accurate.

How important it is then to spend one's available hours in developing salesmanship to the greatest intensity, getting every possible benefit out of the limited time that one has with the dealer. There must be good head work; constant thinking of the next best thing to do; constant activity in the right direction. Perhaps by writing a few good letters to some of your customers or prospects you might get some surprising results. There is a way to reach every dealer and we must find it.

Keep your personality radiating. Watch your appearance, your language, your manner. Keep up your courage and never let your persistence wane. Your resourcefulness will find the way.

I surely am pleased with the way your work is improving.

Write me a good personal letter telling me all about your work and how you like it.

Note—Letter sent especially to new salesmen.

THE HOUSE ORGAN

Many of our large selling organizations have developed the house organ into an indispensable publication. Something in the form of a booklet ranging in size from the single page to a good-sized magazine is sent out periodically. The size of the corporation publishing the organ and the extent of its business, will determine largely the size and circulation of the publication. Some manufacturers send the house organ to the dealers and jobbers with whom they do business or would like to. Others use it largely for stimulating good feeling and interest among employees, and for information of stockholders. One large western oil refining company which controls the fields of Wyoming, publishes a house organ of this kind monthly. It is filled with interesting articles and information relating to company matters, matters

of personal interest to the employees, bits of good advice, articles by officials regarding operation and conditions, all augmented by plenty of good illustrations. Still another type of house organ is that used by large retail establishments for a store paper or magazine, which serves the purpose of promoting loyalty and interest among employees as well as greater efficiency.

The house organ offers great possibilities for the sales department that wishes to emphasize the work of its salesmen; whether it be by furnishing corroborative suggestions regarding such things as selling in different seasons, displaying the manufacturer's goods to best advantage in the display window, on the shelf or counter, or in the show-case; furnishing information regarding the handling and care of stock; the proper methods of storing such articles as cement, plaster and other materials; the best methods of advertising locally in the newspapers, etc., of selling most efficiently in the store; of preventing complaints or taking care of them when they arise; of educating to uses or adaptability; or possibly of furnishing general information that may be of interest to the trade. It gives an opportunity to discuss business in general, government statistics of

interest, what others in business are doing, everything that might seem to be appropriate for the particular publication.

Dealers in cement like to know something about the mill that makes their product. The process of manufacture is interesting. Descriptions, well illustrated, of different parts of the process make good material for the house organ and give the dealer what he should have if he is to sell the product intelligently. The building news, the plans of the State and National Highway Departments, the money situation, the future of prices,—all articles of this nature are read with interest by the lumber dealer who buys cement and plaster. In fact there is a field for drawing information that is almost illimitable for any type of house organ.

The house organ is one other means of co-operating with the salesman in developing and holding business. It supports him in his work, reinforces his position, corroborates his talks and serves to fix in memory what should be placed and kept there. The salesman will be in position to give valuable suggestions as to the content of the house organ which will help to keep it interesting, up-to-date, and valuable as a selling agency.

COOPERATIVE ADVERTISING

Many organizations find it to their advantage to place most of their advertising under the management of a central bureau or association. Such associations have their headquarters in the largest cities where they may enjoy the advantages of their great purchasing power, and the services of the best artists and advertising experts. Instead of sending out advertising themselves, companies are able to have this sent direct by the association often with the company's name printed thereon. In this way the small as well as the large organizations belonging to the association enjoy the advantages of the great educational and promotion work that is accomplished. These associations extend now to almost every line of business. One of the greatest of them is the Portland Cement Manufacturers' Association with headquarters in Chicago. Branches are located in every section of the United States. Men in charge of these branches devote all of their time to education and promotion. In the general headquarters is a complete research laboratory for the study of problems of a technical nature. Here also may be obtained the cooperation of department heads who are specialists in their

particular line. Brick manufacturers, plaster manufacturers, producers of lumber, fruit growers, all have their associations.

ESTABLISHING CONFIDENCE

Confidence is a necessary element of business. The greatest operations of business depend on credit, and credit rests on confidence. It is confidence that overpowers the instinctive tendency toward cautiousness, the feeling that makes us want to be shown. In every branch of selling we demand proof; the man who writes copy must produce his proof. The salesman in the field and in the store must be ready to give it voluntarily because it is expected without the asking.

Business men sometimes overreach themselves in their first attempts to establish confidence by offering goods on consignment,—too much of a risk. With nothing to lose the dealer takes no active steps to sell. By qualifying the consignment in order to obtain interest and active cooperation much more satisfactory results will follow. Offering to exchange unsold goods that are consigned, for others, instead of permitting return and refund of money is much more satisfactory. Or guaranteeing to take

back goods after a fixed period provided the dealer agrees to do certain advertising and display and to lend the cooperation of his sales force during the period mentioned,—a week for example, has been found a safe practise. It will help to establish confidence if we offer to prove at our own expense what we claim for our goods. Guaranteeing wear for a certain period seems often to have been successful in establishing confidence. Large retail stores will permit the return of goods without question, depending entirely on the honesty of the public. Pianos, victrolas, dictaphones and other instruments are placed at customers' disposal free of charge. Confidence once established makes selling easier and less costly. Dealers who have become satisfied with one product of a company and with its policy will be much more easily influenced to purchase others that the company produces. Confidence has been established in the word of the salesman, and in the letters and advertising of the concern, and consequently in the goods.

CHAPTER V

THE SALES LETTER

The sales letter has grown to be a great force in business, with the character and the life and the force of a living salesman. It does everything in selling but talk and think. Next to the personal presence it is the best substitute yet discovered. Its power is demonstrated in the tremendous amount of this kind of mail that is constantly going from place to place. It can be made to lead the buyer through the different steps of making the sale, often even to the point of getting the order. How very important therefore that this letter be correct in every detail, written on proper stationery, and that it be framed in such a way as to be most forceful, most effective.

LETTERS LIVING PERSONALITIES

We have come out of the rut in writing sales and business letters. The stereotyped forms of the earlier days are going. The formal, dry,

cold and lifeless letters of yesterday are being molded into letters of flesh and blood, seeming to think and talk. as the man who writes them thinks and talks.

THE CONVERSATIONAL TONE

If our letters are to represent the living, thinking, talking person they must act as the living acts. They must properly introduce themselves, sit down and talk face to face to the customer. They must impersonate the salesman himself by using the personal, direct and conversational tone. They must avoid old and stereotyped forms, use good plain English, with no *insts.* or *ultimos,* and without overdoing, they must use the pronoun "I" occasionally. They must have good clear, every-day, conversational English, well selected, well put, and yet preserving the required dignity.

Gardner in *Effective Business Letters* has a list of stock phrases well worth studying. He mentions the following:

Advise—of legal origin and overworked. Confine as much as possible to the giving of advice. Use "inform us" or "tell us."

As per—of legal origin. Say "according to."

At hand, or *has come to hand*—obsolete phrases. Say, "We have received."

Beg—as in "beg to state," or "beg to advise"—relics of formal courtesy, sounding unpleasantly servile to-day.

Contents carefully noted—intended to have a courteous sound. Meaningless and occupies valuable space.

Esteemed—as "your esteemed favor." The word is obsolete in this use.

Favor—wrongly used to mean "letter." A favor is a kindness rendered; a letter may do an act of kindness, but it is not itself a kindness.

Hand you—obsolete. Say "send you."

Herewith—in the phrase, "I enclose herewith." This word when used with reference to letters means, "in this envelope," an idea already contained in the word "enclose."

Inst., ult. and prox.—abbreviations of the Latin words "instant," ultimo," and "proximo," and used in legal documents to mean the present, the last, or the next month. Designate the month by its name.

Kind—often misused, as "your kind favor," "your kind order." Another relic of servile courtesy. A superior might write a kind letter rebuking a thoughtless girl in his office, or thanking an employee for a service, or the like. The word should be reserved for such acts of personal consideration; not used in ordinary letters or orders.

Oblige—"and oblige." This makes a weak ending to a letter.

Our Mr. Jones—an inelegant expression in referring to a salesman or representative,

which is gradually giving place to "Mr. Jones, our representative," or merely, "Mr. Jones."

Proposition—a word that has become business slang, and is used to mean almost anything. It really means a proposal or undertaking.

Pronouns or articles omitted—as in the phrase, "Order received and will forward goods at once," for "Your order has been received. We will forward the goods at once." Omissions of this kind have no other excuse than laziness. They make a bad impression on the reader.

Same—wrong when used as a pronoun, as "We will give your account credit for the same," instead of, "We will give your account credit for *it.*" Same is used in legal documents to give precise reference, but it is antiquated. In business letters it is the most persistent among the condemned stock phrases. It is always easy to avoid by the substitution of "it," "they," or "them."

State—is overworked and formal. *Say* is usually better.

Valued—see *esteemed.*

Writer—wrong when used in the mistaken belief that it is improper to use the first person, as in the sentence, "Your letter has been referred to the writer," instead of "to me." Where there is cause for telling your share in an action, the first person is correct and graceful.

Would say or *wish to say*—as in the letter, "Replying to your letter, would say...." An

antiquated and wordy construction. Give your answer directly.

A letter to the dealer who prefers to buy in small carload lots:

Mr. J. A. Gardner,
Orleans, Nebraska.

My dear Mr. Gardner:-

I can see where you can keep down your investment in cement, make it easier to discount your cement bills, turn over your stock more frequently and keep it fresh and more desirable by buying in small carload lots. If you can not conveniently handle large loads we can ship you 30,000 pounds—80 barrels—and still give you the carload price on account of the low carload minimum effective in this state. In order to do this we will load your order with another going your way and save the use of a car.

During the severe car shortage just passed many cars contained two loads in order to save equipment and at the same time give dealers this unusual service. If you have limited storage room you will want to take advantage of this opportunity. Why not fill out this letter and return it now?

.....

LJH. ECD Sales Manager.

.....Cement Company,
Kansas City, Mo.

Gentlemen:- Ship me a small load of cement

.....

Signed.....

This dealer has been reported as preferring small loads. He also has been impressed with the car shortage. The idea of being able to discount for the small amount appeals to him.

Sales letter soliciting plaster business

Dear Mr. Sheets:-

Do you ever stop to think that a plasterer has a good tiresome job pushing a trowel all day long, reaching in every conceivable direction? And do you not realize that if you can make that plasterer's work lighter by getting the trowel to slide easier, over an easy working plastic coat you will make him a good friend and customer? Now, just one other thing:— If you can say to the farmer or other customer that a plaster will make his wall as hard as a sheet of steel, isn't that good talk? Won't that help to make him buy your plaster? Surely it will.

In making our plaster we use about twenty per cent. of pure gypsum mixed with gypsite, from which dark plaster is usually made. This

process gives the plaster the easy working as well as hardening qualities. We can do this without extra cost because we have both kinds of raw material, a very unusual condition.

If you wish to handle the best that plaster science has developed use ..... Plaster. If you wish to please your plasterer, make his work easier, make him advertise your plaster, use ..... If you wish your new house owner to put his thumbs in the arm-holes of his vest and smilingly show his newly-plastered house, use ..... And as popular as this plaster is we can give you service that is just as good as the plaster. Do you not think you had better wire me now for a load? You are going to need plaster soon.

Yours for a smiling plaster trade,

.....

LJH. ECD Sales Manager.

A letter strong in attention and interest value, bringing out information that is vital to the dealer in cement

Dear Mr. Foster:-

You will see when you read this letter that we could not safely make this offer to many of our friends. This morning we went over the map and selected just twenty-five dealers, including yourself, to whom we could safely say what we promise here.

There is not a dealer in America who has not talked about car shortage, poor service and lost

profits because of his inability to get cement when he wanted it. You have thought about it; talked about it many times, haven't you? Now here is your opportunity. Right down at your good door-step we have opened a new plant, with big capacity, located on five different railroads. If there was ever an opportunity to get cars, here it is. If there was ever an opportunity to save cars, here it is again, taking only fifty miles of railroading to serve you while heretofore it took five hundred.

Tell me that you will take advantage of this unusual offer if we will guarantee to give you service when you want it, and all the cooperation that this large organization can give. That sounds good enough to you, doesn't it? Just reverse a telephone call to me now and let me tell you more about this. I am holding the copy of this letter until I hear from you.

Yours for less worry and bigger profits.

.....

LJH. ECD Sales Manager.

Sales letter dwelling on service and resulting profits

Gentlemen:-

During the last ninety days did you lose twenty, or twenty thousand dollars' worth of lumber business because you did not have cement? Are you going to lose again next season?

A dealer from the southern part of Nebraska claims to have lost a twenty-five-thousand-dollar order because he could not get a car of cement. It is going to be worth a good deal to you to have cement this season when you need it, and we can see that you have it. Our new kiln will produce another thousand barrels a day. If you want a part of this thousand, please return this letter to us immediately and we will place you on our list of regular customers.

By the way, gentlemen, the car of cement which sold the twenty-five-thousand-dollar order was a car of .....

Yours for another big year.

.....

LJH. ECD Sales Manager.

..... Cement Company,
Omaha, Nebraska.

Gentlemen:- Please let us have a part of that extra thousand. We use about..... carloads a year.

Signed .....

By .....

Dear Mr. Erickson:-

I believe we can relieve you of some of that worry which you are having in connection with your cement business. I can hear you saying that it is a durned hard job to know just

what to do in times like these. The good company with which you have been doing business has treated you right, you say, and why should you go back on them?

Now, Mr. Erickson, we have been in this same boat ourselves. Some of our good friends are selling customers that we had in the early days and we are glad of it. They deserve this business because they are on the ground. The increase in population has made the location of new plants necessary in that territory. Maybe a number of years ago the dealer in the next town sold lumber where you are now doing business, but conditions have changed and surely you are right in believing that you are entitled to that business to-day.

In these times when service is so important to you and short hauling so vital to the car situation, I am sure that you will see the wisdom of buying from the nearest plant. I am really hoping that this letter will come back with an order. We must have you in our great family.

.....

LJB. ECD Sales Manager.

Dear Brown:- You are right. I am going to buy my cement close to home and help save cars. Enter my order for ..... carloads for shipment within.....days.

Signed .....

Note: The salesman's report of this dealer states that his service is not so satisfactory as it might be; the car situation is affecting him in different ways. The letter is framed on the strength of the salesman's report.

THE APPEARANCE OF THE LETTER

To some extent we can tell the character of a man by his home and the way it is kept, his business and the way it is run, his associations. You probably have received correspondence written on cheap ruled paper. How did it impress you? You have received correspondence also on good, sensible, neat and appropriate stationery; well written, with a ring and tone that made you feel that the one who had sent it had brains, and character, and personality.

The appearance and contents of the letter, which is expected to take the place of the salesman, or to cooperate with him, must surely be looked after carefully. The size of the stationery, the printed or engraved parts such as the letter-head and date line should be in their proper places. All other details such as the location of the salutation, the width of the margin, the indentation of paragraphs, and the general balance of the letter should be looked after. And in this day of doing things in the modern way the letter must, by all means, be typewritten or printed. All of these details tend to give what we find necessary in every branch of selling,—good feeling-tone.

MAKING THE SALE BY LETTER

We now have the letter in a good suit of clothes. The size is standard. The location and appearance of the printed or engraved matter is proper. It is ready to talk business. In the chapter on making the sale the claim is made that this process is fundamentally the same no matter by what means we attempt to sell. Let us see whether or not this applies to the letter. Experience has proved that a large percentage of the letters never obtain more than momentary attention. After being glanced at they pass into the basket. Therefore the first important responsibility that rests on the letter is to obtain and hold attention. As we have seen, volition itself depends on this. In order to obtain attention we are brought again to the laws that govern it which we may summarize as follows. Momentary attention can be obtained by suggestion or description or other vivid reference to size, or motion, or contrast, or isolation, or position. Unless the letter happens to be illustrated, which is not often the case, these incentives must be brought out in the wording. To bring out size, for example, we might start the letter something like this: "Twenty plants with thirty thousand high-

grade, well-paid men and women are constantly serving our customers." "Now that the new year is upon us, and the political unrest of the last year is over, the wheels of industry are turning in earnest to supply the great demand that is expected soon,"—motion or action is suggested here. These will gain attention, but it may be no more than momentary unless they are supported by something intrinsically interesting. Novelty is better if it is not overdone. It must not carry the impression of being forced for the purpose of gaining attention. "Dear Mr. Brown: I have just painted my whole store inside and out in blue. My delivery trucks, advertising, correspondence, everything that I use in my business is going to be blue; blue will be found everywhere. But it is going to be a good blue and mean a great deal to you." Here is a letter winning attention by a description of the unusual, the novel.

If we would obtain and hold attention in the letter we must first look to feeling-tone as we have already shown. Then we must direct the appeal to one or more of the fundamental instincts; to the great group of human interests, the many forms of human desire, the kinds of human emotion, to the many established habits. "Is your daughter looking for a good

position?" "You are not satisfied with your job, are you?" "How much interested are you in that boy of yours in college?" "Do not be ashamed of your home. Build it over for little money." "Is that baby getting the healthiest of food?" "Do not let the kitchen be a place of drudgery." "Stand by your son in trouble." "'Bully! Bully! That is a good smoke.' That's what your uncle Henry says every time he lights a ..... in our store." These are introductory expressions which appeal to interest, desires, emotions and habits. They ought to obtain attention.

HOW OBTAIN INTEREST

The inventor or the manufacturer has had some human interest uppermost in his mind. Here is something that will fill a certain need; meet a certain demand. It links itself well with the interests of the individual, helps him to save, make more money, do better work, secure an education, give the pleasure that he seeks, improves his home, benefits the son or daughter, lessens the labors of the mother. Obtaining interest is, therefore, a matter of bringing vividly before the individual the adaptability of the article to his needs or demands. The in-

dividual does not always realize what are his needs. The letter educates him to this, creates desires and demands, and then proves adaptability. This may be done often in the single letter and again it may require a series. Exposition, description, narration and persuasion will be used to convince, accompanied in many cases by the offer of such proof as actual demonstration.

We obtain interest also by appeal to such emotions as joy, surprise, reverence, hope, gratitude, and such emotional feelings as pride, love, faith, etc. The desires such as the desire for food, drink, sleep, sex, movement, living, pleasure, property, power and knowledge all have great interest value. The habits like smoking, chewing, knitting, hunting, sewing, reading, the social habits, all make us read when they are presented properly in the letter. Here is what the man who sells glassware writes in order to obtain interest and possibly desire: "Your friends will love the lure of gleaming glassware. Like fairy etchings of frost on a window, like lacy network of summer leaves is the tracery on sparkling ..... glassware. It lends an extra lure to the charms of a dainty table."

"Delicate as our patterns are their use is a

pleasure you may enjoy daily, as they can always be quickly replaced and so inexpensively! You need not grieve for 'broken sets' or too costly completing, with ..... lovely pieces."

The dealer who sells washing machines writes to the housewife in this way: "Happy sunny windows with crisp, frilly curtains—what a snug, cozy appearance they give as they are backed by gay cretonnes of smiling colors, or guarded by silent hangings of rich rose or blue! What a joy to see them always fresh and white. And how simple a matter with one of our new electric washers. Down come the mussed, soiled curtains, into the washer they go, and swiftly, thoroughly, the soapy, cleansing water swirls back and forth through them. In eight or ten minutes the curtains come out, all the original freshness and whiteness restored."

CREATING DESIRE

Desire is a consciousness of want together with the impulse to get what is wanted. This impulse of desire is what leads to effort and action. Some desires come only as a result of thought and deliberation and others are unintelligent and instinctive. Life itself depends on food, drink and sleep. There is always the

desire for these unless these desires have been satisfied. We desire movement; we long to live; we love pleasure; we strive to own property; we spend large sums of money and years of time and effort to acquire knowledge and power. Our desires are associated also with our kindred, friends, mankind in general, and finally with our God. The thing that we are selling will make its appeal to one of these if the letter is worded with this in mind. A large correspondence school writes to appeal to the desire for education like this:

"Accountants of every class are needed at once to accept responsible positions paying from eighteen hundred to five thousand dollars a year and up.

"You could secure such a position at once—if you could qualify. There are plenty of them open. The difficulty lies in finding the men—those who have had the necessary accountancy training to handle the work. They are snapped up at high salaries just as rapidly as they can be found..... Read the 'Accountants Wanted' advertisements that were clipped from one edition of a city newspaper and reflect on the shortage of accountants in one city alone. —— has helped himself to secure salary increases equal to six times what he was earning two years ago. When you have completed the course you will be able to call yourself an expert accountant."

MAKING THE LETTER GET ACTION

To get action we must have the resolve or consent to do what the letter suggests. During the period of indecision and unrest, one motive is struggling with another, some inviting and others blocking the sale. The possible pleasure or pain that may result will add impulse; whatever appeals to interest, emotions, desires or habits. Attention must be held constantly. If we can succeed in keeping attention firmly fixed to the exclusion of all other ideas to the contrary the battle of decision is more than half won. The imagination is largely instrumental in volition and must be freely appealed to. We must not overlook the importance of proof; convincing that our statements are true. Finally we will see that an inducement is offered for ordering or buying to-day—*now*. We will give the letter a climax; try through what we have learned to be ideomotor action, to get results by suggestion. "Just call 864 now and ask us to send over a dictaphone for trial," is an appeal to this form of action. Because people do not care to write or to be inconvenienced in ordering, securing possession will be made as easy as possible with such suggestions as "Pin a dollar to this letter and return it at my risk."

FOLLOWING UP WITH THE LETTER

In most lines of business we do not expect to sell on the first call, except to regular customers. The salesman calls time after time, in some lines for years, and then does not obtain the business. If it takes years for the salesman surely we can not expect too much of the first sales letter. We must send out the second one, and the third, and the seventh and the eighth, and then later we must send out more. Each of these letters has its definite work to do. Just as the sales manager lays out the detail to go into each paragraph, so he plans the work for each letter, the series just as logically arranged as the paragraphs of each letter. Perhaps we have an interesting little story to present. If it is interesting and well told it will make good material. It should not be made too long. The nature of the proposition will have much to do with this, but reasonable brevity must be regarded as a virtue in writing sales letters. Not more than a page is preferable.

The first of the series will be introductory, presenting the offer in a general way and making an effort to close the sale. The point of contact or center of interest or strongest features on which to focus, will be brought out in

this introductory letter. Each one to follow will be a reinforcement of the first, bringing out a point regarding the article, which proved, adds a certain amount of impulse. Point by point, probably not more than one to each letter, is proved by the series until volition results, the attempt being made in each letter to get final action through the coupon and other methods generally used for this purpose.

THE SALES LETTER AND THE SALESMAN

The salesman will do well to develop the ability to write a good sales letter. Whatever the salesman does in this respect will serve to reinforce the work of the sales manager and intensify that of the salesman himself. The period of actual contact with the buyer is limited to a small fraction of the twenty-four hours. There are times when the buyer is away and can not be seen until the next trip. There are extreme cases when he can not interview a salesman possibly for days and the salesman must leave. In many lines the period between calls is measured in months. No one can grasp a dealer's situation so well as the man who talks with him, the salesman. Many details of the interview can not be reported, yet they make their impression on the salesman and he

remembers them. Promises are given the salesman, sometimes with the idea that they will be forgotten. Situations are presenting themselves of which he may take advantage. With the aid of a good memorandum book the salesman collects this data and enters it in his diary for future reference. Two weeks after, or three, he finds that a dealer is due to send in an order, or that some important work is to come up for which there is a possibility of getting the contract. Out goes the letter from the salesman following up the matter and he gets results.

My first experience in the advantages of the letter from the salesman came when I wrote as strong a letter as possible to a buyer for a number of lumber yards in South Dakota, one of which was in the territory I traveled. A special trip would have required really too much time and expense for the business that might result, so the letter was used. It got the business. After that I carried my folding machine and wrote several letters daily to dealers who seemed to offer any encouragement. Many of these accounts eventually came to my company, and I attribute the success in a reasonable way to this program of continually writing letters in connection with my personal work.

CHAPTER VI

SELLING AT RETAIL

In the great system of industry and commerce called economic production, retail selling has a very important place. It is the last operation in the system of getting goods from the raw state, into the hands of the consumer in the finished state. In retail selling, the merchant takes over the responsibility of the seller in his relations with the public.

The first great difference that presents itself as existing between selling at retail and at wholesale is that the one selling at wholesale must reach out through his salesmen and advertising into a much larger territory than the retailer. The seller at wholesale may operate over an entire country or even into foreign countries. The retailer operates within a limited field measured generally by the circulation of his local advertising mediums. The second great difference is the fact that the wholesale dealer is not to the same degree in constant and personal contact with his trade as is the re-

tailer. The retailer is continually receiving a line of spectators and customers at or in his store. His business becomes a fixture in the locality. The public learns to know the store, its policy, the quality of its goods, its prices as compared with others. This close contact between the store and its trade makes it the more necessary that the store, its management, its salespeople and its policy be in harmony with the tastes of the trade.

Like every other great movement that occasionally spreads over a country, that of building up and operating the retail stores on an efficient and scientific basis has taken hold of the business world. The policy toward the public has been revolutionized, letting the customer become almost the infallible boss. Whatever the customer does now, right or wrong, is right. He is no more troubled with the rule of *caveat emptor,* which always left him on the defensive in buying, making him cautious, and suspicious and slow to purchase. To-day he takes no chances. We are making his buying a pleasure, giving him goods on approval, guaranteeing the quality in writing, letting him have plenty of credit, calling his attention to special sales by special letters, doing everything to please.

INVESTIGATING BEFORE LOCATING

The wise merchant looks into the number of industries, their character, the number of employees, the wages paid, the regularity of operation, housing conditions, working environment, permanency of population, social conditions, financial condition of the industries themselves, rents, nationalities, bank deposits and similar details. He looks into the surrounding country, the farming community and its relation to the city, the convenience of marketing, the families of these farmers, how large these families are, the incomes, their success, the production history, soil and climatic conditions. Satisfied with these he also looks into the local competition, the character of the other retail stores, how much cooperation he can expect from them. He will get the number of doctors, lawyers, and other professional men, real estate agents, insurance agents, men and women of other employment and their probable buying power.

LOCATING THE STORE ITSELF

Having made a careful investigation the merchant has come to the point of locating. He

then selects the site with the same amount of foresight and care that he selects the city. He has a careful check on the density of traffic; the kind and character and frequency. He knows the number of vehicles and whether they are automobiles, or carriages, and the number of pedestrians, men, women or children, and he knows the hours when they pass. He then looks into the rent, insurance, and tax factors, advertising rates, the local practises of his competitors, the opportunity for obtaining help, wages, amount of delivering to be done, whether the business is cash or credit, whether prices are maintained by competition, the amount of business that might be drawn from other stores, how much would be created, the facilities for keeping a small stock—all existing present and prospective conditions, including the prospect of the growth of the city.

The local competition will be analyzed. Are the competitors old or young, well-established or new, efficient and up-to-date or backward, popular or unpopular, influential over a regular following on account of religion, club or lodge connections, rated well for credit, treating their customers well.

SALES AND PROFITS

To get a reasonable profit from the greatest possible number of sales requires management. It requires a microscopic examination of every department. The seller, including the salesman, the goods to be sold, the customer or buyer, and the manner of making the sale are factors which must be thoroughly analyzed and improved wherever possible. The spirit of the efficiency engineer has reached the field of the retailer. The age of efficiency, of intensification, of new theories and new practises is upon us.

Let us say to the man or woman behind the counter that the details of personality already enumerated in this book, apply to the retail salesman just as much as they do to the wholesale or traveling man. We can not overlook the personal appearance; we can not overlook the manner; we surely can not overlook the language and expression; we can not overlook the importance of knowing much about what we have to sell. The man or woman of ordinary refinement likes to do his buying from the salesperson who dresses modestly, neatly and becomingly; who has a good cordial bow for a friend or customer or visitor; who is patient,

interested in the person's wants, and who can, after every effort has been made to make a sale, very graciously suffer the loss of it. Treatment of this kind brings customers back again.

SELLING EFFICIENCY

There are little details of efficiency which if practised by the salesperson will bring the selling ability to a much higher standard. We must be regularly at work and on time, have a fundamental knowledge of the principles of selling, know the goods, use tact, use good English, remember the name, be original. We must know the store and the location of things, be methodical, honest. We must know something about the work of our superiors, in order to give us breadth and understanding.

By being regularly at work and on time the salesperson increases sales. If every salesperson were to come to the store only when it was convenient, the morale of the entire organization would be affected. The management could never depend on the employees. For the good of the store it is most essential that we get to work every day. It is just as important that we get to work on time and leave on time. In the opening and closing minutes of each day

many an opportunity will present itself to make sales. The buyer has a reason for coming early or late and must purchase at that time. Not being able to obtain service on account of the absence of one or more of the salespersons, the buyer has disappointedly gone to a competitor and a sale is lost. The person who is constantly irregular and late in attendance lacks interest in the work and is not paving the way for advancement.

Dress and manner must be carefully attended to by the salesperson. Too much paint and powder, extremes of design, immodesty of dress, loudness of dress or manner are offensive to many people. Constant gum chewing will drive away people of certain temperaments. Chewing tobacco is inexcusable in any place of business where men and women do their trading. Bad breath keeps customers at a distance. Occasionally we detect offensive odors due to lack of attention to the hair and body cavities. The more powder and paint we notice the more repulsive and unpardonable becomes this condition. In retailing, which necessitates being indoors constantly, personal odors are all the more striking. Cleanliness, sweetness, wholesomeness are wonderfully attractive. There is no greater injustice that we salespeople can do

ourselves than that of failing to keep clean, failing to use soap and water freely, failing to dress in clean, well-kept clothes. No less important is the matter of carrying ourselves well, walking briskly and standing erect. We must not overlook the attraction of a pleasant smile. We must express our interest in the customer with our eyes, face and actions. We must leave the slang at home. We must be a lady or gentleman in the real sense of these words.

DISCIPLINE

To obey the code of rules or methods of practise in force in the retail store is as important as it is in the army. We can not get far in the army without discipline. Things must be done in a certain way, and that certain way must be followed by all. The certain way of running the retail store has been decided on by the management after most careful study and experience. Each salesperson has certain things to do and certain ways of doing them. We must have rules to run any organization and these rules must be obeyed. Let us learn the rules of our store and obey them.

Any salesman is a better one for having interested himself in obtaining knowledge of the

business beyond his immediate work; for having learned the reasons for construction and arranging and managing the store as it is done. The cooperation of the salesman is worth much to the management. It is worth much more with this knowledge of the point of view of the management, because having this point of view the salesman cooperates with greater sympathy.

By having a thorough knowledge of the goods the retail selling is made more efficient. In retail selling we must know our stock, what it is and where to find it. We must know the good seller and the poor seller. We must know the quantity on hand, the ordinary demand, and see that the stock is replenished as required. We must know prices and quality. By knowing price and quality, we can assist in making selections that are suited to the taste and pocketbook of the purchaser. Our knowledge of goods must include the knowledge of their uses. If we are selling hardware and can not tell the uses of a certain wrench, we are worthless. That wrench has some very attractive talking points which we ought to know, and which would help us to sell it. Our knowledge of goods should include the knowledge of quality also. If knowing the quality necessitates learning how the goods are made let us learn this.

If we know that a certain automobile tire is made of four or five plies of good fabric, instead of three, we have a valuable selling point which will help to make a sale. Knowing the goods means knowing the condition of the goods. If some of them are not in salable condition it is important to make this known. A thorough knowledge of the goods enables one to talk over such selling points as style, durability, the purpose for which the article is best suited, its convenience to the customer, the comfort which it gives, its purity, safety, beauty, construction, the cost to produce it, how it compares with similar articles made by competitors, who are the makers, whether or not it is guaranteed, who are using it and how they are satisfied. One writer says: "Half the secret in attracting and holding customers often simply amounts to knowing a bit more about the goods than the other fellow and taking the pains to explain it to customers. The dealer who does is usually a lap or two ahead when it comes to interesting customers."

Our explanations must not be over the head of the buyer. Technical matters should be brought out in a simple and interesting way or they will not be understood. Talking about the details on an engine or automobile might do

very well for some buyers, yet would be most monotonous and hazy to others.

Concentrate on your customer, see that there is nothing to distract, like noises, smells, smoke or dust. Make the customer comfortable, taking him or her from the gaze of the public if this is advisable. Never let over-anxiety bring into the situation more than one salesman at a time. Aim to please rather than to sell. By aiming to please the selling will take care of itself. Be thorough, patient, interesting in your descriptions. Keep your mind on your work. Appeal from every angle, politely, graciously and sincerely, by means of suggestion, by exercising the buyer's imagination, by appealing to the instincts, emotions, desires, interests and habits. Appeal to the parent for the child, to the husband for the wife, to the lover of music and tone with the piano, to the love for clothing with style, to imitation by telling of others who have bought, to individuality by showing distinctiveness and uncommonness. Humor the selfish; make it easy for the lazy; let the customer sell himself if possible; cater to his vanity; make him like you and your store. Help the undecided by suggesting; inspire confidence by giving undisputed proof to the suspicious; agree with and flatter the one who

knows as much about the goods as you do; let the talking one talk but not drift too far from the matter of a sale. Find the vital point of attack in the indifferent and reticent, possibly by a question; show the advantages of immediate buying to the one who would wait; be active and in harmony with the one who is nervous and must have things done quickly, and be slow and deliberate with those who would take their time. Comfort the tired; preserve your dignity for the dignified. Anticipate the buyer's objections by answering them before they are asked. Tell the truth always. Say and do the right thing at the right time.

A certain dry goods merchant examining into his business came to the following conclusions: First, that a desire to sell can be so strong as to defeat its own purpose. The desire being selfish, may lead us to forget the point of view of the customer. Second, that any business depends on the good will and confidence of its customers. Third, that if the desire to please and serve the public is kept uppermost in our minds we will develop a much greater volume of trade than if we merely try to sell. By pleasing the public with our goods and service our selling takes care of itself.

Remembering the name is one of the most

appealing faculties that the salesperson can have. The opportunity of learning the name of a customer is not always favorable. When the introduction takes place we do not hear it or understand it. There is a way to get the name and to remember it, and it is well worth cultivating. First get the name firmly fixed in the mind, clearly imprinted there. Get it correctly spelled and pronounced. Repeat it to yourself as often as possible while you are talking to the person, associating the name with the person and especially with the face. Continue to do this after the person has left. This continued repetition and association will make remembering much easier.

Still other important details to be attended to in our selling are the use of tact, good judgment, keeping the character above reproach, letting the imagination play its part freely, taking advantage of the power of suggestion, thinking, thinking, thinking! The customer's tendencies, his actions while buying, the things that he examines, the comments that he makes, —all these tend to assist in determining what will appeal to him. It is a matter of common knowledge that the woman is much more particular and careful in her buying than the man. Another detail worth remembering is that those

who are most difficult to please, once pleased, make the most loyal customers. They know that they are difficult to please and they give credit to the salesperson who can do it. Nor should we forget that selling properly means pleasing, and that the person who buys hastily may be dissatisfied and will return the goods, an uneconomical practise reflecting on the salesperson if it happens frequently. We must learn to know people; be able to judge them to some extent by their appearance, manner and actions. Much can be learned by studying people with whom we come in contact in our work in the store. We have already made a detailed examination of the buyer in the chapter on that subject.

ORIGINALITY

Remember that the man or woman buyer is calling on salesperson after salesperson, in one store and another, day after day. When, therefore, the same form of address, the same questions, the same expressions are heard time after time in dealing with these employees, a feeling of monotony comes over the buyer, a feeling that these words and expressions are stereotyped and ought to be changed for something new and original. "Something?"—"Do you

wish to be waited on?"—"What's yours?"—"What do you want?"—these are just a few of the common expressions. Let us change them. Let us say something appropriate but different. Each customer may present himself in such a way as to offer an opportunity to do or say something that is out of the ordinary. Take advantage of it.

WE MUST KEEP IN MIND THE FACT THAT IN SELLING WE ARE FUNDAMENTALLY APPEALING TO THE INSTINCTS

Instinct is the natural and inborn inclination and ability to do certain things without being taught, like the inclination of the duckling to go for the water as soon as it leaves the shell. These instincts vary in different persons, yet they can be classified as common to all. Some of us have the instinct for music, some for numbers, some for harmony, others for balance. We all have the instinct for wanting to acquire. From the day we are born we have the hunger instinct. Later we develop the instinct for clothing. Every business man is in business by reason of his instinct for acquiring or collecting. Other instincts which are common to all are curiosity, companionship, imitation, indi-

viduality, the parental instinct and the instincts of sympathy, modesty, travel, fear and anger. Did you ever stop to consider that the man who designs or invents is a student of interests, emotions, desires and habits. Did you ever consider that the man or woman that buys for your department is a student of these same incentives? These men and women buyers know popular needs and demands and must only be convinced of adaptability to fill these needs or supply these demands when they make purchases. Every piece of goods in the retail store makes its appeal, when properly presented, to some fundamental instinct. There is clothing, for example. We must have it. It is one of our strongest interests. In connection with it our feeling of pride, almost emotional in some persons, says we must have style. Acquisitiveness, which springs from the instinct of hoarding or collecting, says we must have a fair price.

A pleasant and courteous environment and a willingness to please give the good feeling-tone which is so much desired in all branches of selling. Although there are many surprises in store for the salesman who attempts to "size up" a person, there is a way to determine by tactfully questioning, by carefully directed conversation, by appearance, action and other evi-

dence just what the person desires or needs and what will meet these desires and supply the needs. The buyer who knows exactly what he wants will require little of the salesman's time and attention. Serving this person will be merely taking an order. Then there is the person who knows just about what he wants. Serving him requires not much more salesmanship. There is another class, however, "just looking," or who have made one purchase and might be interested in another. Getting this individual to purchase requires salesmanship; the same inevitable process of getting attention, interest, desire and volition,—good constructive salesmanship, the kind that lifts the salesman from the level of the common to that of the expert.

YOUR SALARY IS PAID FOR CLOSING SALES

There is no money made in retailing unless goods are actually sold. Selling and getting the money keeps the store and salaries going. We may have a wonderful store, a beautiful line of goods, an excellent display. The place may be filled with people day after day looking at our goods and hearing our appeals, yet if we can not close the sale the store will go into

bankruptcy. We must close and have the customer satisfied. This closing must be done with tact. There can not be the appearance of forcing. The appearance must be that of trying to please. Gentle suggestions here and there, extreme patience in showing every style that might satisfy, as a last resort letting the undecided customer take home the article if there seems to be an opportunity to please, asking at the proper time if the article is to be charged or paid for in cash, requesting the name and address, handing the article to the customer with the attitude that you regard it as sold, asking when the person wants it, or how he wants it sent, or which style he prefers, are only some of the means of closing by suggestion. Think again, and do not leave anything undone that should be done to make the sale in the proper way.

AS A LAST RESORT, INTRODUCE THE CUSTOMER TO SOME ONE HIGHER UP

If the sale is of sufficient importance, and everything possible has been done to please the customer, a very good practise is to introduce the customer to some one higher up in the department. Those in authority may decide on

account of the circumstances that a concession might be offered, or some other consideration given in order to close the sale. If it is then impossible to make the sale, the customer must nevertheless be thanked for his time and requested to come again just as sincerely and courteously as if a sale had been made.

KNOW THE LOCATION OF OTHER DEPARTMENTS IN THE STORE

The higher work of creating business demands that salespersons know the location of other departments than their own. If the customer is buying a coat from one department, something to go with it which may be had in that department or in some other, should be suggested. Possibly it is the boot and shoe department, since it is a stormy morning and the customer seems to need rubbers. If the buyer has purchased a heavy coat he may want also a heavy cap, or a flannel shirt. We should know what is on sale and where the sales are taking place, what is specially advertised. All matters of interest pertaining to the store, and which may be asked about should be known to the salespersons. Every sale, whether it be from one department or another, is important.

All should therefore cooperate to see that the sale is made, even if the manager of the rug department has to take the customer to the shoe department to make it.

BY BEING METHODICAL, TAKING ADVANTAGE OF THE QUICKEST, MOST EFFICIENT WAY OF DOING THINGS THE SALESPERSON ADDS TO HIS ABILITY

There is a long and short way to do things. Let us have the short way; it saves time. Names should be correctly spelled and written. Bundles should be tied in the most efficient way. House numbers and street addresses should be correct; when incorrect they cause much inconvenience, loss of time and disappointment. Change should be made quickly and correctly. If the credit must be looked into have it quickly and properly and diplomatically done in order to save time and ill feeling. See that totals are correct, that orders are properly taken with nothing omitted. Little mistakes and omissions may mean much. A wrong spool of thread may mean that the dressmaker must wait. A wrong number may mean that some one will be without slippers for the opera. An incorrect name may mean another trip to the store by some one who has been patiently waiting for delivery.

Do not hesitate to get the correct spelling of a name, even if you have to have it written out for you. All items of purchase should be fully and clearly written down, sufficiently in detail for proper identification should this become necessary. The number of articles is as important as the description of them. If the salesperson will show the order to the customer for approval of name, correctness of address, number, and of the articles ordered little more time will be required and much trouble will be avoided.

How would you feel were you to get a C. O. D. shipment with the price higher than you agreed to pay? If the price of the C. O. D. is too high the customer will not pay, and if it is too low the company may never be able to collect the difference. Be honest with the customer and prove that you are so by calling attention to errors even if you have to telephone to do it. Do not let customers suspect that their credit is questioned by sending orders C. O. D., which should be sent otherwise, and do not send articles otherwise that should go C. O. D. You may make a present of these articles to the person at the expense of your company. The whole matter resolves itself into one of being careful. BE CAREFUL! We have put it in capitals

because it means so much in any branch of selling.

In retailing the attention is obtained by advertising, window display, store display, and occasionally by some extraordinary means. You know the power of the full-page newspaper advertisement that is so often used by the department store. The newspaper advertisement is as important to the woman buyer as is the sporting page to the baseball fan. You know too the power of a good window display. Men and women and children stop to study the new designs and latest suggestions in millinery, suits, dresses, and toys. Now regarding store display! Where do we buy our chocolates? Do we buy them from the merchant with the dark, dusty, sticky and unsanitary candy counter, or do we step into the store with good appointments, agreeable decorations, plate-glass show cases, and with attractive boxes and containers? This is store display.

The man who writes the advertisements for the store knows that the real selling points of an article of merchandise are the qualities and benefits of that article as they exist in the buyer's mind. In the volume on attracting and holding attention, in Shaw's *Retailing Series* we find this: "The real psychology of adver-

tising is this: A man buys an article for the good he will get out of it, and never for the benefit of the merchant. He buys it because he wants to buy it and not because the merchant wants him to.... Therefore in finding the selling points in his goods the advertiser should consider his goods from the customer's point of view, and present his selling talk in a way that will make the customer really agree with the merchandiser's idea; namely, that the goods are worth having."

In obtaining the attention by advertising and display the customer is visualized, as they say. He is vividly pictured with all of his surroundings. His mode of living, practises in buying, where he lives, how he lives, his occupation, his income, his probable likes and dislikes are pictured. Knowing the uses of one's goods enables one to fit these uses to the condition and circumstances of the buyer. In dealing with the class of buyers who have not been reached by advertising, and display, the salesman gains attention and interest in the same manner. He must do the work in this particular case of the advertiser and window-trimmer or decorator, in addition to doing his usual work in retail selling.

THE BETTER RETAIL SALESMAN SHOULD KNOW SOMETHING OF STORE MANAGEMENT, WINDOW DISPLAY, ADVERTISING AND OTHER INCIDENTALS OF THE RETAIL BUSINESS

Some excellent ideas in retailing, advertising and managing have come from the small-town dealers. Some of our most effective advertisements have come from men formerly salesmen in little towns who made a study of advertising. The salesman of the small towns and of the smaller stores of the large cities, must be more versatile than the specialist salesman of the large city department store. The work of the salesman of the small town is more general, taking in often the matter of advertising, window display, possibly temporary management. This is the salesman of to-day who will be the business man of to-morrow. How much better will his salesmanship be if he knows something about the work higher up in his business. The broader his knowledge of business in general and of things in general, the more effective will be his selling.

THE VALUE OF WINDOW AND STORE DISPLAY

Density of traffic adds value to window display. Window display is very strong adver-

tising because of its realism. In this respect it is next to handling the goods themselves. If there is action in the display it becomes still more real. Crowds stop to watch the young athlete demonstrate the shoulder brace. The display window yields an opportunity to give a perfect object lesson full of life and action, so real that when the athlete straightens his shoulders the spectator straightens his also. We are rarely disappointed in the impression we obtain from the display window. It is a very effective method of letting the goods sell themselves. And no less important is the display within the store. The opportunity is just as great here for keeping goods before the constant stream of traffic and in many cases gaining attention and interest that would otherwise never have been gained.

WINDOW AND STORE DISPLAY

The background must be relevant. It is neither good taste nor good judgment to use a background of a busy mill and its smoky surroundings for a display of perfumery. If our store were in the steel mill district and we had a soap display, the mill and some of its employees cheerfully removing the grease and grit with this soap would be relevant.

Good display is an art. It requires skilful and systematic arrangement. Certain combinations, certain kinds of lines, certain blending of colors have esthetic value; beauty and taste and refinement that make one want to stop and ponder and enjoy. Surely care in arranging the cloth or garments or articles on display, seeing that they are in good condition, and that they are naturally placed are important. A skirt thrown over the shoulder of a form would not be natural. It should be where it belongs. The things displayed should have agreement in their relation, conformity, symmetry and harmony. Any object or picture that is presented to the mind, whether it be in advertising, or in display, must have balance and unity. Everything must be where it belongs, inviting the eye to pass from one object to another, naturally and unconsciously, having nothing to interfere with the impression which is being made on the mind. Then the things displayed should have meaning; express something, some thought or suggestion. A group of figures representing children of different ages, dressed in the latest of the season's apparel is a meaningful suggestion. The bedroom completely equipped, or the dining-room, or kitchen, give a complete suggestion with meaning. There is surely no

meaning to a display of silverware and harness, but to harness and harness polish or grease or other stable accessories there is plenty of meaning. Display with meaning is creative. It associates in the mind the relevant. The purchase or presentation of one thing of this related group has a tendency to suggest others. We place a new bed in a room and immediately notice incompleteness in some respect; not the right kind of rug; pictures inappropriate or something omitted or irregular. Irregular why? Because meaningful display has educated us to this feeling. Go back to the laws of memory and you will find that association is its very basis.

In good display objects must necessarily predominate over setting. If ingenuity in color arrangement predominates to the extent of drawing attention to it rather than to the goods, the display is to this extent a failure. The style must be in keeping with the environment. Location and the character of the traffic must be kept in mind. Idealism, or showing ultra styles—those above the average taste—is regarded as effective. Extreme effects make observers curious to learn if the more conservative styles are not exceptionally good-looking. Bizarre effects, the grotesque, odd and fantas-

tic are being freely made use of if it is possible to do so without detracting from the goods themselves.

THE IMPORTANCE OF LINES AND SURFACES

It is well to remember that there are grace and beauty in waves and curves. The grace of the classic dancer is explained in the waves and curves of her movements and gestures. Lines themselves affect the feeling-tone. We are pleased with certain lines on the automobile. We say it has good or bad lines. The lines of clothing are agreeable or disagreeable to us; and so the lines of arrangement in our display window will have agreeable or disagreeable feeling-tone. The firmness and dignity in vertical lines make us respond by standing erect and holding the head high. Now regarding horizontal lines, it is easier to swing the head from side to side than it is up and down. Furthermore, objects at rest are in horizontal positions; they therefore suggest peace and quiet and restfulness. Diagonal lines suggest action like that of the athlete running or hurdling, or the dog leaping through space. We seem to have a native preference for ellipses, ovals and oblong shapes rather than for squares and circles,

The shape of almost every article of regular use proves this; for example, the envelope, the oblong desk or door or window or piano, or the store itself, the calling card, dance-hall, living-room, even the display window. Following this same inclination we prefer the cone, pyramid or triangle or star, to the cube or sphere.

Display is not normal unless it has balance. We are very quick to detect lack of balance in anything. In an art window, mass can be balanced against vista, or against other objects suitable in size and suggestive of weight for balance. To avoid topheaviness, more must be below the center than above, where the light and delicate belong; where nature puts the birds and clouds. Too much in the window suggesting overcrowding, is not good. There should be breathing space and allowance for the effect of background.

The attractiveness of color is very great. It too must have harmony, and masses of color must balance if a color scheme is attempted as is often the case in the strictly art window.

The art window is not always possible on account of the nature of the goods displayed. Groups of small articles such as groceries, including teas, coffees, canned goods and the like, must often be displayed in what is some-

times called the "checker-board" arrangement. This arrangement covers the floor and walls of the display case or window, the articles being properly grouped. The disadvantage of this is the appearance of crowding and the tendency to rob of distinctness, with nothing standing out to make a special impression to make one remember.

Some merchants are very successful who use the entire store for display. Although the display windows are to some extent set apart, they are really a feature of the display of the entire store. The vastness and the opportunity to give meaning to all display are extraordinary, especially at night when good lighting facilities unfold the beauties of the entire first floor which has been carefully and purposefully planned and arranged. There is a great opportunity for the furniture dealer with such a display, and for the one who wishes to give distinction to his automobile store.

The observer welcomes the sight of ferns and flowers, velour in proper colors, and other tasteful and suitable decoration. Standards and fixtures rather negative than positive, add to the beauty of the window.

In display, as in personal selling and advertising, the constant effort should be to strike a

responsive chord. There is a way to show goods which will bring out most forcefully their adaptability to needs or demands; link them with the interests of the observer, with his probable desires and habits; appeal to his emotions. When this point of contact, or center of interest, is discovered and featured the work is at its best. If we can bring out the central figure or idea around which everything else revolves and is subordinated, and so create a focul point for flitting attention, the impression on memory is made the stronger—the problem again of the advertiser and the salesman.

APPEARANCE OF THE WINDOW AND THE STORE

The salesman will find that paint, the broom and the wash cloth are not forgotten in running the modern store. The exterior will be attractive, and a good advertisement of what is within, by having it kept painted. The surroundings, walks, windows, floors, display cases, and the goods themselves are kept clean and attractive. In the stores of our larger cities, men and women are constantly cleaning and putting things in order, keeping them fresh, bright and inviting. The good effect of a beautiful painting can be spoiled by putting it in a poor frame. The good effect of our work in the

display window can be spoiled by the detracting influence of a poor exterior.

The public demands frequent changes in the display. As soon as a certain display has done its work it should be changed. The local conditions will help to determine the frequency with which changes should be made, like the density of traffic, and the apparent drawing power of the display. The life and progressiveness of the management are reflected in making frequent changes.

SOME SIGNIFICANT THINGS

The entrances should be carefully located; the doors should work easily or be opened by attendants. They should be wide enough for the traffic, and level with the walks. The factor of safety is always considered because with heavy traffic passing constantly through the entrances, accidents are likely to happen, and damage suits accumulate. Respecting efficiency and economy, the modern manager studies the arrangement of his departments and of the things in each department, placing these in the relation to each other with the idea in mind of making the operation of the entire store as efficient and economical and conve-

nient as possible. Access to the different departments is made easy, the relative density of traffic to different departments being considered. The floor plan is made as simple as may be. In order to prevent crowds from gathering near entrances and interfering with traffic only goods which sell themselves readily should be placed near the entrances. In the floor arrangement the peculiarities of the man buyer should not be overlooked. He will not follow a labyrinth of departments and counters to do his buying. Unless the purpose is to cater to the exclusive class the store will try to educate the public to believe that it belongs to everybody. Goods should be placed where they will, as much as possible, sell themselves even though there is some loss from their being handled freely. The supply of cards should be plentiful, good cards well designed and printed or painted with prices, directions, descriptions and other labor-saving information. Appropriate display fixtures which will save space and labor, as in unpacking, and which will serve as salesmen in many cases, should be plentiful but not conspicuous. Whenever the nature of the goods will permit they should be displayed compactly, in the grocery for example, with canned goods for a base and selected glass con-

tainers for a mounting pyramid. This saves space and adds variety. The importance of association should not be forgotten. Articles most naturally associated with one another should be exploited by juxtaposition in arrangement, by suggestion from the salesperson, and possibly in department advertising, on cards, or even on the containers themselves.

The modern manager studies the records of his store and learns the buying habits of his customers, then caters to these habits. If he sells more hardware on Wednesday than on any other day, he makes an effort to sell even more by catering to this line on that day. He knows the value of traffic throughout the store; it makes the sales. Bargain counters, entertainments, and special attractions are held with the idea of distributing the traffic where it will do the most good. The comfort of patrons and employees is always kept in mind by seeing to ventilation, light, rest rooms, nurseries and other conveniences. The buyer must be put in the right frame of mind to do business.

ORGANIZATION OF THE LARGE RETAIL STORE

The general manager as is usual has charge. Reporting to him are the store superintendent,

advertising manager, merchandise manager, and records manager. The store superintendent buys the supplies, looks after complaints, exchanges and adjustments, deliveries, inspectors and wrappers, care of the building, including heating, lighting, cleaning, repairing and watching, has direction of the stenographers and floor managers. The advertising manager has charge of all copy, preparing for newspapers, display cards, window trimming, and mail-order circulars. The merchandise manager looks after the buyers, salesmen and customers, and probably after the alteration department. The records manager has charge of the stock-keeping, marking and checking, statistics, mailing lists, etc., bookkeeping which includes supervision over cashiers, credit salesmen, purchases and expenses, and also after credits and collections.

THE CONFERENCE IS VALUABLE

The modern manager has his weekly meetings of department heads for the purpose of taking up matters of importance. Periodically the manager gets together his salespeople for conference, general discussions, speech-making, and inspirational work. Complaints, sugges-

tions and new ideas spring from the conference, giving results often of great value. Here is where matters of policy are discussed and determined; problems which can not safely be left to the judgment of one person, are considered and solved by the group.

DETAILS OF MODERN STORE POLICY

The employer is interested in keeping up the health and spirit of employees. This is acknowledged as necessary if enthusiasm and interest, concentration and loyalty are expected. The employer provides for a reasonable amount of rest, for proper ventilation, light, drinking water, sanitary toilets, sometimes lockers and drying-rooms. Very generally now we find the lunch room in the large stores. Good fire protection is essential, and in large organizations sometimes medical attention. The company likes to have its employees satisfied. For their pleasure whenever possible the library is accessible for good reading. The ball team provides healthy outdoor sport, and so the walking club, or the company camp. In some of the largest organizations very high-grade schools are provided for instructing employees in the ways of their work. Employees must not for-

get therefore that the employer feels much interested in their welfare because it is to his interest as well as theirs to have them healthy, efficient and satisfied, and to that end he is constantly planning and working.

Other details of policy are such as having one price to all. The public is too well informed as to prices to overlook any differences. Modern policy also says that it is not good ethics to go beyond the threshold of the store to solicit. Let advertising do this or telephoning perhaps, but not the salesman himself. Then let courtesy reign everywhere says modern policy. Let every one from the general manager to the night watchman be a promoter of courtesy, extending it to every customer, rich or poor, white or black, clean or dirty. The salesman should cooperate in the policy regarding complaints, doing his part to have it reasonable and farsighted with future business in contemplation. Then in the effort to establish confidence, permitting the return of goods under reasonable restrictions is good policy, many concerns regarding it as advisable to do this without question whenever requested. Many stores now have definite lengths of time during which original prices are maintained on certain articles such as millinery, after which reductions are

provided for. Automatic bargain basements are the clearing house for all goods which do not move sufficiently fast in the regular departments at original prices. For their own good, salespersons should welcome the policy of instruction in salesmanship. This adds impetus to business which means a better prospect for the employees as well as the company. They may check and rate the employees. All right; this is good work. Then the salesman knows the measure of his ability and effort and can be governed accordingly. Needless to say there must be honesty in the policy, actual bargains or none, no misrepresentations, no guarantees that are not guarantees. Finally the management must stand by the representations and errors of its employees even though loss is involved, a fact which should bring the constant cooperation and care of the salespeople.

ATTITUDE TOWARD COMPETITORS

Although there is still much suspicion and jealousy among competitors in the retail business, those who are regarded as most progressive have come to realize the importance of working together. This spirit of cooperation has been evoked largely by the creation of the

thousands of commercial organizations, and the spreading of educational literature and propaganda by manufacturers and jobbers. The success of the manufacturer depends on the success of the retail dealer. The manufacturer first realized the importance of developing the cooperative spirit and brought the value of it to the attention of the retailer. Although retail dealers are not attempting to form monopolies, which would be unlawful, they are working harmoniously, each asking a fair price for his goods, each letting the other have his share of the business, each borrowing or buying from the other when necessary, both purchasing from the same manufacturer and often receiving their shipments in the same car. This cooperative spirit is putting life into cities that were dead. It is trimming the whiskers of the fogies; cleaning up the old-fashioned stores and putting them on a modern basis; bringing in manufacturing and increasing the population.

The first thing that the retailer, who would be up to the times, must do is to rid his system of jealousy and suspicion, and over-anxiety to do all of the business in a community, and to replace these retrogressive notions with the spirit of cooperation and good fellowship toward competitors and other business men of

his locality. The salesman must also reflect this spirit in his dealing with the public, not forgetting that his employer pays his salary, nor forgetting either that it is the employer's intention to be fair with all others in business, and that no unfair practises, unfair dealings, or unfavorable remarks will be warranted.

CHAPTER VII

A KNOWLEDGE OF THE FUNDAMENTALS OF ADVERTISING MAKES BETTER SALESMEN

If our selling is at its best, the sales manager is letting advertising do the preliminary work and the salesman do the closing. Clothing, shoes, silverware or cigars are introduced to the buyer in the magazines, newspapers, attractive folders and in the sales letter, long before the salesman has left for the field. Good photographs or drawings with strong, clear descriptive matter have reached the buyer and made an appeal. Possibly he has ordered. Possibly he is in the frame of mind to order. Possibly, yet not often, he has not been impressed by the advertising. Only what the advertising has left undone does the salesman have to do.

We advise our salesmen to have knowledge of goods, of policy, of selling. To be consistent we must advise him to have knowledge of the thing which works with him and like him;—in his stead, in his absence, to do the very things

which he is called upon to do personally,—advertising. If there is any power in advertising, the secret of that power will be of great value to the salesman. The situation which the advertiser must meet is in many respects the situation which the salesman must meet and the ways in which he must meet it. Both are trying to sell, one with the picture and written word, and the other with the article itself and the spoken word. Both are appealing to needs, desires; the advertiser through the eye, and the salesman through the senses generally.

Advertising is done in one or more of the following ways: in the national magazines,—the advertising of the wholesale dealer or manufacturer; in the daily and weekly papers, the mediums of the retailer; in the class periodicals such as the trade journals, farm papers, etc.; on the electric signs and bill-boards; in the street-cars; direct by mail; with letters, circulars, the house organ, etc.; in the theater program; by moving pictures; by demonstration, distributing and sampling, and with the use of novelties.

SCIENCE IN ADVERTISING

Doctor Harry Hollingsworth writes in *Advertising and Selling*: "In the laboratory

we find students measuring the intensity of sensations, the degree of attention, the strength of belief, the legibility of hand-writing, the agreeableness of color combinations, the excellency of literary compositions, the eminence of scientific men, the humor of comic situations, and many other things which are no less subjective than the persuasiveness of a selling talk or the pulling power of an advertisement."

The call of science has reached the field of advertising. Our advertising is still in the experimental stage. We have to try it on the few before sending it out to the many. We are not yet able to predetermine what the pulling power will be without this testing and experimenting. For years the psychologist has been at work and it is claimed that interesting things are developing. The time may come when we shall be able to say that an advertisement of certain structure will appeal and pull, with the same degree of assurance that we now say that sweets will appeal to the child.

THE SPECIALISTS

Advertising has become so important that many large and responsible concerns have sprung up, especially in the largest cities, of-

fering their services to the man who has the big problem. In the largest of these organizations we will find seven or eight departments, the men in each department specialists in their particular line of work. One will have a general knowledge of advertising and marketing, and will be prepared with the assistance of his associates to give general counsel and to engineer the work in connection with a marketing or an advertising problem. Associated with him will be the man who investigates advertising possibilities, another who prepares the copy and plan, another who looks after the art work, still another who has charge of the printing or typography, another who knows all of the magazines, trade papers, farm papers, and other mediums, their prices and advertising value, and lastly the one who checks the advertising to see what it is accomplishing and what it is costing.

THE GREAT WORK OF ADVERTISING

The great work of advertising is to educate; to lay before the public the nature of the thing to be sold, teaching its uses and adaptability to needs; to keep the memory of the buying public refreshed by repetition, by constant presen-

tation from one angle and another; and eventually to get the goods from the producer to the consumer with the greatest economy.

BEFORE WE ADVERTISE WE INVESTIGATE

We do all of the necessary preliminary work before deciding on a campaign. We determine by study, and investigation, and experience, what is the thing to do and the best way to do it. We do not wander around, guessing and groping, trying to get our bearings. We learn what is the kind of advertising that is needed and when and where it should be done and how extensively. We do not overlook the necessity of making it easy for the man who wants the advertised article to get it. We remember that the local dealer may be an important member of this group of campaigners. We try to fix the ratio of advertising investment for the business by considering all relevant factors, like quality, cost, marketing price, whether the article is a necessity or luxury, trade conditions affecting the product, competition, the necessity of acquaintance advertising, the possible per capita sale, the life of the product and rapidity of consumption, change of fashion, whether the demand is seasonable or constant,

the sales support that will be obtained, transportation possibilities, whether or not there is a general line of goods that will derive benefit, whether subsidiary sales will follow, like the records of the victrola, and whether the demand already created must be maintained.

If the campaign is for the ice-cream manufacturers of Omaha, we will first study quotas, examine our government statistics to learn how much ice-cream is consumed per capita in the United States and in certain parts thereof, and especially in cities that have the population and climatic conditions of Omaha. By comparing Omaha's per capita consumption with that of other places of the same character, an idea can be gained of how much the consumption can be increased by good advertising, and how much the advertiser can afford to pay for this campaign. There is nothing of greater importance than to have a good and thorough preliminary investigation before entering upon an extensive advertising campaign. Nothing of importance is done in these days of efficiency without a plan.

Mr. E. E. Calkins, in *The Business of Advertising,* gives a very good summary of the things to be done in planning the marketing of a new product.

"Investigate the market and distributing possibilities," he says; "the attitude of the trade; line up the obstacles and plan for their elimination; get a name—preferably one descriptive of the article, easily pronounced, easily remembered, and capable of being protected legally; get a good package, of good design, shape and appearance with good display value, practical and economical; work out the advertising plan having in mind the traveling man, jobber, dealer, store salesman, consumer and competing goods; decide on a general sales plan fitting it to the conditions and tying it up with the advertising plan; be careful in the selection and costs of media, and the size of space to use; have the copy properly illustrated, designed, printed, and worded compelling attention and pulling value; finally prove the advertising to see that the many parts and detail are in harmony."

THE IMPORTANCE OF COPY IN THE ADVERTISING CAMPAIGN

Copy is the company's silent messenger. It is given the responsibility of telling the advertiser's story. Often the buying public sees nothing of the manufacturer but his copy, not even a salesman. Five thousand dollars may be the price of a single advertisement. If the copy makes no appeal, gets no attention, does not interpret correctly the message of the man-

ufacturer, the money might better be given to charity. Copy has a big job in these advertising campaigns, and it must measure up to this job. The illustration, designing, printing, and wording must be correct.

THE IMPORTANT MATTER OF KNOWLEDGE

Successful public speakers tell us that the secret of good speaking is to have an overwhelming knowledge of the subject; be saturated with it so completely that the ideas flow freely and without hesitation. Study will convince any one that there is not a book on salesmanship, sales letter-writing, or advertising, that does not lay great stress on the importance of knowing all about the thing that we have to sell or to advertise. Unless we ourselves know, we can not impart knowledge. Unless we ourselves know, we can not describe uses and adaptability to needs. Unless we know other articles we can not compare. The man who uses cement likes to know that it is tested every hour and made by experts. The woman who buys ice-cream likes to know that it is rich in butter fat and therefore creamy. By knowing of what an article is made, how it is made, what its history is, we have material that makes advertising what it should be.

Knowledge presents the opportunity to give individuality and distinctiveness. Knowledge gives the point of view of the maker, of the outsider, and of the buyer and user. It comprehends the service that goes with the sale of the article. It places before the advertiser the character of the people who are to buy, their circumstances, financial standing, occupation, sex, age, education, and other factors. It gives us the point of view of the woman, of the boy or girl, of the college man, of the high-school graduate, of the working man.

Dependable knowledge should come from a dependable source. If it is knowledge of the kitchen it should come from the kitchen. Who can tell us more about the needs of the kitchen than the thinking woman who spends her hours there? Who can give better suggestions regarding the nursery than the woman who spends much of her time there? A current advertisement claims that a certain electric iron is correct in every detail because it was designed by women. Every improvement shown is the result of a woman's suggestion.

KNOWLEDGE OF LOCAL CONDITIONS

There must be a market for the article. There must be some one to use it. A farmer

can not use a rotary kiln. We would not advertise rotary kilns in farm papers. If competition is keen and plentiful we must determine intelligently whether it is advisable to spend much money to break into the field. Whether the article is already in the stores or will be when the advertising is sent out, must be taken into consideration. In some localities, and especially in some foreign countries peculiarities of custom may overthrow a selling policy. The color of the container may be sufficient to spell doom. Those who have advertised in Chili know that we can not talk about Santa Claus there; they do not believe in him.

WE HAVE COME NOW TO THE POINT WHERE WE MUST WRITE SOMETHING THAT WILL BE SEEN, READ, BELIEVED AND REMEMBERED

We must write something, we say, that must be seen, read, believed and remembered. We must in other words get attention. If interest and desire are to result, it must surely be read, and if we are to have action immediately or in the future, it must be believed and remembered. The advertising man has a problem that is fundamentally no different from that of any other man in the business of selling. We are going to

find that with difference only in the equipment with which he must work, he obtains volition in the same manner as does any other individual who sells, whether he be the man on the road, in the store, or sending out the sales letter. All must alike go back to the buyer, determine first what will gain his attention. The methods are almost fixed. We learn what, in our article or proposition, will appeal to his interests and desires, and on the strength of the resulting impulse which always accompanies desire, we finally get action. In the following pages we shall get an idea of the methods used by the advertiser in getting and holding attention; how this is developed into interest, eventually into desire, perhaps, and in many cases into the result of making the sale.

In a general way the advertisement is designed by securing not more than a few shapes or forms that are related properly, placing them in proper proportions, providing for sufficiency of base, proper balance, good color combination with correct relation between such details as the picture itself, border and type, a focul point with satisfactory movement of lines to carry the eye to it and to whatever may reinforce it in making the impression; and finally securing strength and harmony.

Possibly the head-line will be a command such as: "Protect Your Family from the Wolf," "Buy Directly from the Manufacturer," "Chew Gridley's Gum." Very often the question is used: "Do You Like Good Fishing?" "Is that Daughter of Yours Going to Boarding School?" "Wouldn't You Like To Bathe at Rockaway?" The head-line may be a mere declaration of style, quality or price. "Pretty Fitting Cravenettes for the Damp Weather," "Our Six Dollar Ladies' Pumps Are Worth Ten," "Working Your Way through College Is Easy if You Are Selling Maps," "Wanted—A Man for This $10,000 Job," "Father! Let's Talk about That Boy." Accompanying a good illustration of ladies' apparel we have; "Slim, Youthful Lines, Flatteringly Plain and Plainly Flattering." The manufacturer of vacuum sweepers says: "More Leisure for Mother." Notice the simplicity of language designed to appeal to the mass in the following: "They Always Want More,—Blank's All O' the Wheat Bread!" "Green's Grapelade, the pure Grape Spread." "Brown's Supreme Ham." "Block's Vinegars,—Every Drop Awakens Flavor." Under the illustration of a kitchen in which

the maid is using the ware advertised we find the head-lines: "You will be prouder of your kitchen than ever before if you equip it with a set of beautiful bright Never Wear Out Aluminum Cooking Utensils." Here is an elaborate New York hotel dining-room filled with guests. Under the illustration we find the heading to a baking powder advertisement: "THE FINEST FOOD IN THE WORLD! That is what New York demands. And New York gets it." Let us consider first the nature of the people to whom we are sending the message, then with the aid of a good picture, a phrase or expression that grips, and strong, well put words we can gain attention.

Attention value depends on the advertisement's position; on whether it is located at the top or bottom, right or left or middle of the page, and whether or not the page is near the front or back cover, or of the advertising sections. Attention also depends on intensity, striking colors, pictures, etc., on the size of the advertisement, on the length of time that it is seen, the frequency of its appearance, the change of form and the display of action.

We have already analyzed the laws of attention. They apply to advertising as well as to other branches of selling. A mental process

such as seeing, smelling or imagining becomes clearer and more distinct with attention; becomes more intense, increased in duration as does time when we dwell on it; comes more quickly into consciousness as do details when pointed out. We have seen that it is the very basis of volition; that it is short-lived, passing from one thing to another quickly, and that its range is limited to a few things at a time.

In order to obtain attention the advertisement must have something in it that will link it, or "tie it up" with the ideas which the reader may have by reason of such factors as education, purpose, age, social environment, attitude, etc. If one is working with a definite purpose, anything tending to aid him will have attention value. If at this moment I were to see an advertisement of a book that would help me in writing on the subject of attention, I would give the *advertisement* attention. If one's attitude toward the idea or suggestion produced in the advertisement is favorable or unfavorable there will be attention value. The tendency to action will be greater if the attitude is favorable. A farmer who has had difficulty with a tractor may be definitely set against tractors and will give no attention to advertisements. If he has used one successfully he will

welcome new ideas and suggestions. Education and experience broaden the interests and change them. Our opinions, tastes, judgments and desires change with education and experience. An advertisement with an appeal to the civil or electrical engineer means little to the man without the engineer's training. Heredity is also important; whether or not we are descendants of the wealthy American banker or the poor German or Swedish farmer or mill employee. Age has much to do with interests, the attractions of youth being different from those of middle and old age. Then social environment must not be overlooked. Those with whom we travel in social life have much to do with the molding of our tastes and habits. We may be individualistic, aristocratic and exclusive, devoting much attention to club, social life, golf, polo, fine horses, hunting and the like, or we may have the simpler, more inexpensive, unpretentious habits of the middle and poor classes. The man who writes the advertisement knows his article and its uses; knows the public and its needs or demands and how best to link the two together. If it is tooth paste the message goes to the world; if it is baking powder, to the housewife; if it is the vacuum sweeper, to the mother and daughter; if it is

the tractor the message goes to the farmer, and so on. Professor Adams, in *Advertising and Its Mental Laws*, says: "The incoming stimulus must be linked up with other ideas, derived either from our past experience, or with our hereditary responses to situations. As given by Pillsbury (*Attention*, p. 50) they are: Idea in mind, purpose, attitude, education, social pressure, and heredity."

MECHANICAL HELPS IN HOLDING ATTENTION

We have seen how attention flits from place to place. Complexity in the advertisement invites this; invites attention to pass from one part of the advertisement to another. Each division of the complex advertisement leads naturally to another, interest and association being brought out in every part and tending by its relevancy to give unity to the whole advertisement. The complexity must be limited to two or three kinds of type or color or figures because of the limit of the range of attention.

Unity is assisted mechanically by such devices as having all faces pointing in the same direction, all arrows, borders, pointers and other details inviting the eye to follow from one thing to another, all relevant and reinforcing in

effect. The center of interest, or focul point, or point of attack, must stand out strongly, not detracted from by over-ornamentation of the rest of the advertisement, if the unity is to be at its best.

OBTAINING PERMANENT ATTENTION

Inasmuch as we have carefully examined the methods of obtaining and holding attention in another chapter, we need only summarize here what has been learned. In advertising we find the methods the same as in every other branch of selling. What does the advertiser select as the means for getting and holding attention in a lasting way? He selects the following: (1) Novelty, the unusual, the grotesque, fantastic, —bizarre effects; (2) Color, looking carefully to the bright and striking, with good tone and harmony; (3) Illustration, including good cuts, photographs and sketches; (4) Action, displayed in persons, places or things; (5) The Comic, portrayed in word and picture; (6) Feeling or Affective Tone, or the quality of giving pleasure, excitement or strain, or displeasure, calmness and ease; (7) Appealing through the fundamental instincts to the interests, emotions, desires and habits.

FEELING-TONE ALWAYS FUNDAMENTAL

In advertising, feeling or affective tone is very important in holding attention. Pleasant impressions made by the advertising remain with us while we evade the unpleasant, retarding its force and making the impression faint. The details of good feeling-tone read much like those which we examined with respect to window and store display and personal selling. There must be symmetry or proper arrangement of the parts of the advertisement with reference to one another; proper proportion or relation in size and degree of the parts; clearness; balance, giving proper distribution at the top, bottom, right or left of the advertisement; harmony or a pleasing agreement of the parts, including the colors; proper colors; proper lines and spaces; proper mass arrangement, and atmosphere. The wording must be correct and pleasing. The objects selected, topics dwelt upon, people represented, purposes expressed, arguments advanced, associations produced, all help or harm the affective tone. The cow itself must be kept out of the advertisement for meats unless its surroundings are idealized. The farmer, not the city banker, must be represented in the advertisement directed to the

farmer. The purposes expressed must be in harmony with those to whom the message is sent. The associations produced must be agreeable. Even such details as the character and direction of lines add to the tone of the advertisement. There must be an opportunity for pleasing eye movement.

THE VALUE OF SURROUNDINGS

Professor Adams (p. 200 *Advertising and Its Mental Laws*) mentions an experiment on ninety-nine students of the University of Michigan for the purpose of determining the effects of surroundings on the pleasantness or unpleasantness of an advertisement. A certain food advertisement was arranged on a large page surrounded by advertisements of other concerns. The experiment showed that pleasantness was greatest when this advertisement was placed with other edibles such as candy, pop corn and pork and beans, next in the order of pleasantness when surrounded with chocolates, locks and insurance, third in the order of pleasantness with an advertisement of an optical company; fourth, when placed with chocolates, a jewelry advertisement and cameras. The lowest in order of pleasantness was obtained with hosiery, rubber heels,

etc. In other words the more heterogeneous the surroundings became the lower the degree of pleasantness.

STRIKING THE RESPONSIVE CHORD

There is something about every article to be sold that makes the strongest appeal; pulls the hardest; produces action the quickest. That magnetic something is important. In order to find it we must know our article from raw material to finished product, and all of its possible uses, and we must know people of all classes and their needs; we must have their point of view with relation to the article. In personal selling we have a much greater opportunity to determine adaptability than in advertising. In advertising, what we are able to learn in our study and experiment with the few we apply to the many. We must in advertising determine the vital point of attack before sending out our expensive message or we lose. The quicker we discover it the more goods we sell at the least cost.

Efforts have been made to compare the relative strength of different appeals but only in a general way and not very successfully. Tests have been made on students in different

universities under conditions which taken together did not represent exactly the situation that the practical advertiser has to meet. The experiments are on an educated class which does not represent the cosmopolitan character of the mass to which the advertising message is usually sent. We show for comparison the results of tests made at Harvard and at Columbia. The strength or pulling power is shown in the order reported in the tests. The appeals were in the abstract and presented to twenty men and twenty women at Columbia.

Tests at Harvard	Tests at Columbia
1. Mere assertion of value	Manufactured by approved Scientific Methods
2. Time saved; efficiency	Durability
3. Scientific construction	Sanitary
4. Durability	Efficiency
5. Economy	Time saved
6. Reputation of firm	Appetizing
7. Modernity	Family affection
8. Personal comfort	Value
9. Health, cleanliness	Evolution—years of experimenting
10. Imitation of others	Ambition
11. Appetizing	Self-defense
12. Recommendation of others	Reputation

13. Ambition and pride	Guaranteed
14. Sporting instincts and play	Guaranty
15. Family affection	Safety
16. Medicinal value	Popular
17. Hospitality and courtesy	Economy
18. Civic loyalty and patriotism	Maternal love
19. Used by social superiors	Modernity
20. Beautifying qualities	Health
21. Imported	Quality
22. Warning against substitutes	Elegance
23. Sympathy	Bargain
24.	Sympathy

The Columbia list was more lengthy. Courtesty was placed at 27, amusement at 29, hospitality at 30, cheap at 36, civic pride at 40, patriotism at 41, style at 45, imported at 48, beautifying qualities at 49.

Abstract appeals are too general to be of use. The warning against substitutes may be vital in the purchase of some articles and mean little in the purchase of others. Convenience may be the appeal in preparing soup; hospitality in the service of a hotel or bank, ambition and family affection in the matter of education, but none of these may be important necessarily in connection with other things. One of our large magazines found that the appeal to

the boy to make money by selling the magazine was not nearly so strong as the appeal to the parents to have him do something useful. The correspondence schools talk rather of knowledge, position and salaries than of books and study. The talking machine companies talk of Creatore, Caruso and Gluck rather than of the mechanical details of their machine. The development of personality may be uppermost in the minds of some. The fact that overalls are union-made may produce action in the union man. Style is surely uppermost in the mind of the society woman posing as a connoisseur of fashions.

We are back once more to the problem of knowing our article or proposition, and the individual to whom we expect to sell and his needs or demands all well enough to find the strongest bond of connection between them. We are back again to the question of determining interests; of learning to what emotions or desires or habits we can most successfully make the appeal. Perhaps you play golf. Will not an advertisement with a good photographic suggestion regarding the making of a certain shot strike you? Would you not be inclined to send for the advertiser's booklet on golf? If you are a housewife would not the photograph

of a modern kitchen displaying a labor-saving convenience make you read the text of the advertisement? If you like chickens would you not read a story about them? If your boy is in the university would you not be interested in something pertaining to his work? Here before me are sections of well-known magazines appealing with mere announcements to the general interest in education. The desire for food is so strong that interest is aroused with pictures of appetizing dishes and accompanying recipes, and surrounding them with little stories of human interest regarding the home. A flavoring extract advertiser pictures the children expressing a craving for cakes flavored with his vanilla.

The granite company says, under the headline on the monument: "In Loving Memory—Grief mellows with the years, and the tomb becomes the shrine of tender memories. And what tribute more fitting, more adequate than a design in the lovely gray of the eternal granite, the finest and most enduring of monumental materials."—An appeal to the emotion of grief. The following appeals to the desire to save or accumulate, acquisitiveness; "economize by reducing rent with an Easy Davenport; install one in your library or parlor and you add to

your home the equivalent of an extra bedroom and save at least ten to fifteen dollars monthly.'' Appealing to habit we find a biscuit company picturing a table with a vase of flowers, a book and a box of wafers, under which are the suggestive words: ''A good book, a quiet nook, and our wafers to eat between thrills of the story.''

Not only the wording but the general structure of the advertisement should have an element of interest. The arrangement, typography, ornament, literary style, illustrations should produce agreeable or disagreeable, strained or unstrained, comfortable or uncomfortable sensations as demanded. Novelty in cuts, faces, forms, shapes and designs, in arrangement, name, spelling, position, trademarks and trade names, verse and expressions. People love the colors; pause to discuss them; recall them; plan on them. They are of great consequence in getting the advertisement to function as it should. Pictures, when appropriate, striking and artistic impress the visualist who reads in pictures rather than in words; and when relevant they reinforce the advertisement for all classes. Always interesting are persons, animals and things in action,—the dancing maiden, for example, the runner in action or the tarpon leaping in the air.

THE PICTURE AND THE SUGGESTION

The eye is constantly glancing at objects. During every hour of the day the mind receives its myriad of impressions through the eyes. How much easier and how much more natural for me to glance at the vase of peonies on my desk this morning than to read a description of it. How much easier to glance at the picture of these peonies than to concentrate on a description in words. Pictures probably appeal more to the visual than to the auditory motor type, yet the appeal is strong to both. Pictures are one of the simplest, most powerful means of description, clear to the child, and understood even by those who can not read. The language of the picture is universal. For these reasons a picture has come to be a part of almost every good advertisement. The experienced advertiser sees that it is relevant, associated with the thought or message which he is driving home, reinforcing instead of detracting from it. He lets it portray what may connect with the reader's interests, emotions, habits or desires, doing team-work with the words of exposition, description, persuasion or argument. He is guided again by the rules or laws of attention, interest, desire and volition in the

selection and use of the picture. It will have its focul point and those associated with it. It will have its balance, intensity, unity and other requirements. It will have novelty and originality not overworking such pictures as that of the child or pretty woman. It will not cover too much ground, often showing only a part of the human figure in action, a small section of the room, or part of the floor surrounding the vacuum sweeper perhaps. The nature of the article will have much to do with this, some articles demanding more extensive environment.

IMAGINATION PLAYS AN IMPORTANT PART

What wonderful power in the imagination! With it we do all of our designing, inventing, painting; all of our creative and constructive work. With it we give different surroundings to the thing which we have to sell, different conditions, place it among different kinds of people in different parts of the country, in different climates. We can with the imagination picture to ourselves and to our readers, *our* boy in the executive chair; picture the sportsman in the streams of the Rockies; place ourselves under the spray of Niagara, gathering violets. We can see the truck load of peaches going from our orchard to market, over good

roads, with no transferring or unnecessary handling. We can see the possibilities of a certain investment. Imagination is the master-painter or artist, giving vivid pictures of pleasure, of delicious foods and pleasing drinks, of beautiful gowns, of modern homes. The salesman and the advertiser play on this imagination, making it work to their advantage, placing the article in the fancied possession of the buyer and picturing its uses and advantages. It helps to give tone to the advertisement. By arousing the images of the sense of touch, taste, smell, or temperature, great force is added to the advertisement. Words full of relevant and proper suggestion will do this; making these appeals over the subconscious route to emotion, desire or habit rather than to reason. Pictures and words which arouse pleasant associations are very effective in doing this, especially if the words are taken from the vocabulary of poetry and romance; the field of song and story.

LANGUAGE: THE STYLE AND FORCE OF THE ADVERTISEMENT

Discourse is of four kinds: descriptive, narrative, persuasive and expositive. Description represents to the reader the attributes or gives

the characteristics of an article, portraying and explaining its construction, operation and uses. Narration in advertising gives the story of the history and achievements of the company and its article. "For sixty years our goods have made their frequent turnovers on the shelves of America's best stores." Persuasion, consisting of exhortation or argumentation, works on such feelings as those of gain, comfort, fame, honor, ease, etc., and makes its appeal to reason. It presents arguments for and against, anticipates objections and otherwise debates the question of purchase or ownership in a convincing way. To be most persuasive the copy should present the affirmative of a proposition, give liberal presentation of the other side, anticipate the objections, avoid arguments and if possible summarize what has been presented. This can be most successfully done in the letter or folder where space is more plentiful. The advertisement brings out the information piece by piece; point by point. Persuasion recommends, appeals to interests. Exposition explains how an article does what is claimed for it. Illustration is valuable in exposition. The information must be exact and condensed, not introducing persuasion or other kinds of discourse.

The literary style and force of the appeal is as important as the style of the writer of books. Putting our personality into advertising may make specialists of us. Not all advertisers are adapted in personality and style to advertise certain articles. A man who might be excellent in advertising furniture might be a failure with tobacco. He might write a good advertisement for a camera but be unsatisfactory for soft drinks. The style must be appropriate for the thing to be advertised. Good style requires the use of the matter that is interesting, presented naturally and sincerely, rather than too cleverly and smartly. This, however, does not mean sacrificing brightness, picturesqueness and cheerfulness when the article advertised permits. The breezy and possibly the slangy style has its place in advertising as well as on the stage, and in good literature. Whatever the character may be, it must not detract, like the over-dressed salesman, from the force of the appeal. Catchy, cute, sparkling and amusing expressions are appropriately used for low-priced articles like household utensils, soaps, washing powders, drinks, tobacco, etc. The best advertisement gives the reason why the statements of the advertisement are true,—the convincing style. The light and catchy and breezy is intended to

appeal rather to impulses than to calm deliberate reflection.

The use of the pronoun "you" has been used freely in advertising as in letter-writing. Possibly it has been overdone. Too much "you" and "your" may become monotonous. When used to a reasonable extent it is very effective. "Your boy should be a lawyer," "Your coal bins will be empty," "You, sir, should take advantage," etc., are examples of this use. Conversational style is often used to advantage. Popular stories are full of dialogue and conversation. When it is natural it is interesting. Manufacturers of medicines, cosmetics and other articles find the testimonial form valuable. Another popular style is the story advertisement or descriptive article. The tire manufacturer tells us how the gum is gathered in the Tropics and put into the rubber that makes our tires. The asphalt company lets us know that nature seasons its product under the sun of India. The retail dealer tells us the story of how he is able to give a bargain.

Price, when comparatively low, may be attractive to the economical, but to the exclusive may make no appeal. Positive statements are regarded as more forceful than negative ones yet the circumstances may change this opinion.

Associations produced should be positive rather than negative. Sometimes we may find the shocking producing best results especially if accompanied with benevolent appeal. "Whose Fault?" says the advertiser of goggles under the picture of the unfortunate man who has just lost his sight. In the trade papers we find the language of the chemist for the chemist and the language of the engineer for the engineer. If we are writing to the great cosmopolitan world our language must be the language of the mass, simple and clear but proper.

FIXING THE IMPRESSION

Association, we have found, is the basis of memory. If two ideas enter consciousness at the same time, or in immediate succession, the reentering of one idea at a later date will tend to bring to consciousness the other. The more frequently that a nervous current passes over the same pathway to the brain the deeper and more distinct does this pathway become, much like the pathway in the meadow from constant use. As walking becomes easier on a smooth pathway so nervous currents pass with greater ease over well-worn nervous pathways. A well-defined pathway tends to drain energy from

other centers not so well-defined and active only at random. This exchanging of energy produces a connection called association. One idea is bound up with others; grouped. Associated ideas are therefore the result of these modified brain pathways. Single unassociated ideas spring up spontaneously in the mind; connection with other associated ideas brings them up. "Association takes place when nervous energy from one center flows out into related centers, causing a corresponding related consciousness. This overflowing of energy must take place along a nervous pathway, and this pathway must be formed in the nervous tissue before the exchange is direct. The general rule is that energy radiates out in all directions from a center so long as all paths have equal resistance. Now if two adjacent centers should discharge at the same moment, there would be a pathway between them which would be doubly excited, and hence its resistance would be lowered.....Every element thus tends to bring up again the whole of which it was previously a part."*

Association is therefore important in fixing the impression of our advertisements. Naturally we can take advantage of it in many ef-

*Hollingsworth—*Advertising and Selling,* page 190.

fective ways. Contiguity has been exemplified since advertising began in such expressions as "Opposite the Hippodrome." "Just east of the Gayety." "Over Brandeis." Similarity, or the resemblance of things to each other tends to recall either to the mind when the other is presented. Certain elements of each being similar or identical call up both wholes of which they have before been a part. One man's walk reminds of another's; one man's nose, of another with a nose of the same kind. Two names or two places that are similar will be brought up together by association. Still another basis of association is emotional congruity. If the feelings aroused by two different experiences are the same, experiencing later one feeling will bring up the other. The advertiser sees that these feelings are agreeable, because they may lead us to purchase. Such appeals are successfully made through sympathy, interest, loyalty, civic pride, local atmosphere, excitement over current events, popular ideas, fashions, customs, crazes or whatever the public is most directly and immediately concerned in, or better still, permanently concerned in like matters of general welfare.

Our advertisers have long ago learned the importance of frequency in fixing the impres-

sion of an advertisement. The most often repeated gives the strongest connection. Tests show that repeated material obtains several times the memory value of unrepeated. Next to repetition in strengthening the association and fixing the advertisements in the mind is vividness, brought about through surprise, strong attention, interest, desire, fear, hope, envy, or some other interest, desire, emotion or habit. That is the reason we find advertisements in strong colors. That is why in the large cities we find the enormous signs; humorous associations such as are now being used by a prominent soft-drink manufacturer and by some of the tobacco companies. This vividness is brought about by having the reader dwell on the advertisement by such means as the clipping of coupons, tracing the picture, selecting mispelled words, or names, suitable jingles, etc. The first impression or association is important since it will generally predominate when other factors are equal. Tests showing the value of position of an advertisement prove that the first and last pages are remembered better than those in the middle section. The last impression will also be important, however, in many cases as important as the first. The length or the amount of detail in the adver-

tisement is important in fixing the impression, the amount remembered depending on the length. Memory depends furthermore on the attention value of the advertisement. Whatever helps attention helps memory. In familiar songs and jingles we have examples of the importance of rhythm and rhyme in fixing impressions. The words or melody of a song or the catchy arrangement of a jingle will remain with us in spite of our efforts to forget them. And so with cleverly arranged expressions containing alliteration. "The Home of the Honey Bees" is used by the manufacturer of honey. "Put your Sweeping Reliance on a Bissell Appliance." "The Supreme Seasoning." "Pioneer Makers of Power Washers," these are samples of alliteration and rhyme. Ingenuity holds what novelty attracts. "Keen Kutter," "Upsonize," "Rough on Rats," such expressions are not easily forgotten. If the advertiser can influence the reader to go through certain movements in connection with the advertisement the memory is aided. Many people in memorizing must be rocking or swinging, waving the arms, reading aloud, moving the lips, etc. This is called motor-reinforcement, producing action to strengthen the impression of what we say in the advertisement. "Weigh

Yourself. If You Are Five Feet Ten You Should Weigh 175 Pounds." "Test Your Mouth for Acid," suggesting motor-reinforcement in the appeal to the desire for health.

Back in 1908 Professor Walter Dill Scott, of Northwestern University, finished his work on *The Psychology of Advertising,* one of the first works by a psychologist on the subject of advertising. In this work he said regarding memory: "Impressions once received leave traces of themselves, so that, in imagination, we can live over the same experiences and can recognize them as related to our past. The knowledge of former impressions, or states of mind, which have already once dropped from consciousness, is what is known as memory.... Our memories gradually fade with time..... We forget very rapidly during the first few seconds, minutes and hours." (See page 8.) "One can improve the memory by the observance of a few well-known and thoroughly established principles.... Repeat it in all ways possible—say it over aloud, write it, look at it after it is written, think how it sounded when you heard the name, recall it at frequent periods and until it has become thoroughly fixed in your mind."

Besides repetition Doctor Scott mentions in-

tensity, association and ingenuity. Let us have his own words regarding association. "The things which we think over, classify and systematize, and thus get associated with our previous experience, are the things which we commit most easily and retain the longest..... The details of business or professional life which are connected in a series are not hard to learn, and are not soon forgotten."*

The successful advertising man constantly strives for greatest memory value. The advertisement must call up many pictures, each of which tends to reinforce the argument. In repetition he will preserve identity but present from different angles, in new and refreshing ways. He will look to proper color, contrast and harmony in the advertisement itself and in its surroundings on the page. Then he will make full use of the power of association, taking advantage of emotional congruity like picturing the esthetic in connection with the talking machine instead of the tone; picturing the wonderful climate, abundant crops, etc., in connection with lands in California. He will take advantage of the mechanical adjustment of things to assist memory; the ingenious

*Page 10—*Psychology of Advertising.*

method including unusual spelling, newly coined words and expressions, verse, etc. Then he will change his appeal to win those whose imagery is of a particular kind, imagery being visual, auditory, muscular, gustatory and olfactory.

PROVOKING RESPONSE

We have considered some of the ways of attracting and holding attention, arousing interest, and of fixing the impression of the advertisement in memory. Consideration must now be given to the all-important matter of obtaining volition. When a reader has been influenced by an advertisement or series of advertisements to the point where he is in the frame of mind for buying, suggestion is effective in provoking response. This is done by appealing to the imagination by command or assertion, question, invitation, or appeal to the fundamental instincts, interests, emotions, desires or habits;—what the psychologist calls ideomotor action, which we have referred to in other branches of selling. The nervous energy generated by the suggestion emerges at the other end of the arc in the form of action. The suggestion must have strength and vividness. The one who makes it must have accepted

knowledge and authority. Like the advertisement itself the suggestion must come frequently, first in one form and then in another, appealing to one kind of imagery or another. The suggestion must be positive rather than negative, because it leads us to act on impulse rather than after deliberation. If, therefore, we suggest the negative we obtain the negative. Finally the suggestion must be in harmony with well-established habits and feelings, not inviting us to violate our every-day habits and customs.

If we expect our advertisement to close orders we must give the reader the path of least resistance in ordering, asking him to do no more than "pin the bill to the advertisement" or return the coupon, postal or other device. The method of ordering must center on some simple and single operation, preferably not requiring the sending of money. Willingness to send at the seller's risk for the buyer's trial and approval is now very popular.

ADVERTISING AND DEMONSTRATING WITH MOVING PICTURES

Moving-picture advertising, either through the medium of the theater, or in the use of the machine in connection with personal selling of-

fers an exceptional opportunity for effective work. We have found in the study of attention and interest that action is exceedingly valuable. Persons or things in action, or represented in action by language or picture or both always bring attention and probably interest. The great advantage of moving-picture advertising is the possibility of displaying action; it is action itself. Furthermore it gives unusual opportunity for concentration, nothing else for the time being presenting itself on the screen or in the environment. The reader is present of his own volition for pleasure, when not pressed with details of business or profession.

It presents a great opportunity for realism in bringing to the public the story of the manufacturer; his plant and its environment, methods of manufacture and other information not possible to convey equally well in any other manner. Names, addresses, trade-marks, catch phrases and other features can be brought out very strongly. Appeals to the human interests, desires, emotions and habits can be, by means of real humorous or dramatic situations, given an indelible impress on the minds of those who see the picture. The manufacturer of woolens, oriental rugs, furniture; the laundryman, the summer resort, the railroads, have tried the

moving-picture and many continue to use it with great enthusiasm. It is adaptable for demonstration of endurance, speed contests, unusual production, power like that of the motor-truck, showing the tire from the time the rubber is gathered in the Tropics until it is on the car or truck. Where actual demonstration is impossible the film is used to good advantage. The salesman carrying the film can demonstrate the tractor, the great crusher, the rotary kiln, and other equipment and machinery too large or otherwise impossible to demonstrate actually. It has been used to demonstrate the use of dynamite in farming, blowing trees and stumps. Even the newspaper by promoting its occasional local romance gets its advertising benefit, while the local exhibitor, appreciating the value of the local appeal, is generally willing to show the film without charge. Some specialists in this form of advertising have made the claim that eventually every business organization of any importance will have its moving-picture department constantly working out new ways and means of using the picture to advantage, and in many cases going so far as to have a group of actors and equipment, including the studio.

FOREWORD

SELLING THE CONTENTS OF THIS BOOK TO THE SALESMAN WHO IS CONSIDERING WHETHER HE WILL BE REPAID FOR THE EFFORT REQUIRED TO MASTER IT.

This book is intended for the person who is convinced that salesmanship is an honorable profession, rendering an important and difficult service. It is for those who have awakened to the fact that the salesman is not born ready made, with his powers fully developed.

The salesman must be made, in large part at least, by serious study. The efficient salesman must know the workings of, and have skill in influencing complicated and intangible mental processes, which determine the behaviour of men. It takes persistent hard work to gain an understanding of the factors and processes which determine the actions of men. The salesman's efficiency will vary directly with this understanding.

The scientific farmer, the teacher, the accountant, the lawyer, the engineer, the architect, the physician, the minister, and many others, have found it well worth their while to make a serious and careful preparation for the practice of their profession. The salesman will at last come to realize that intelli-

gent preparation for his work is quite as important, and will bring equally great reward.

The salesman can determine whether he is fully prepared for the practice of his profession by asking himself a few questions, and grading himself on his ability to answer them.

What is salesmanship? What does the approach aim to accomplish? What are the laws which govern the direction of attention to a thing, when it has once been secured? How is attention related to interest? What interests does the normal man have? Do you know to what interests your selling appeal should be directed? What is the relation between interest and desire? How would you undertake to arouse desire? When you have aroused desire, do you know how to carry it over into action? How can you tell when you have reached the "psychological moment" for attempting to close? How can a man think ahead and plan what he will say next, while his attention is adequately given to what he is saying? What are the best methods of learning, remembering, and thinking?

This book aims to give the salesman scientific knowledge which will enable him to answer satisfactorily the foregoing, and many other similar questions. Scientific knowledge is thorough and consistent. Methods guided by such knowledge are efficient in accomplishing the desired result. A scientific knowledge of mental processes enables the salesman to work intelligently and directly toward

the end he wishes to achieve, instead of resorting to the aimless and wasteful try, try again of the man whose knowledge is not equal to the demands of the situation.

The salesman ought not to be discouraged, or condemn this book, if he does not at once grasp the full significance or practical helpfulness of all it contains. Two or more thoughtful readings may be required to enable one to get the psychological point of view and master the method of the science. One has not mastered this discussion in a way that will make it of the greatest practical helpfulness until he understands clearly all the parts, and perceives their relations to each other and to the whole. He must learn to reassemble and to put to working harmoniously together the various processes that are here knocked down and taken apart for purposes of study.

The writer has tried long and earnestly to make this book elementary and practical. He is convinced that he could make it simpler only at the expense of making it more superficial. This would defeat the end aimed at in preparing it. The difficulty encountered in understanding and applying what is written here results mainly from the intangible nature of the subject matter and the lack of skill in exploring one's own mental processes. As one becomes skilled in the exploration of his own mind, the practical usefulness of the principles discussed here will become apparent.

INTRODUCTION

SALESMAN PERFORMS AN ECONOMIC FUNCTION

AS A FACTOR in the world of business the salesman is concerned with effecting a mutually advantageous exchange, in which money, or some other means of securing satisfaction, or some form of satisfaction, is received in return for the service, or serviceable thing sold. As the salesman performs an important business function, he should have some knowledge of business affairs.

The salesman must be master of his merchandise. He should have adequate knowledge of the materials, and mechanical and industrial processes employed in making the articles he sells. He must clearly perceive what the process of manufacture confers on the article, in giving to it qualities which make it have a commercial value superior to other things with which it may come into competition. It is generally recognized that it is important for the salesman to have knowledge of these things which may be called the material factors in salesmanship.

A man may be well informed in regard to the things previously mentioned and still be very poorly equipped in salesmanship. Additional factors which make for success, are knowledge of what to do in attempting to sell, and why it is done; also skill in

doing it. Skill may be developed best by practice in which one's efforts are guided by knowledge of the "what" and the "why." It is the purpose of this book to help to give a knowledge of the what to do, and why to do it.

PRACTICAL KNOWLEDGE AND SKILL

The art of selling may be acquired by blind imitation of other's methods of selling and by more or less haphazard methods of trial and error. The methods that fail are rejected and the methods that succeed are adopted, without knowing why they fail or succeed.

By this process one may gain considerable knowledge of what to do and may become skillful in doing it. But he will be able to apply this knowledge and skill only under the conditions in which he learned to apply them. They are not readily transferable and adaptable to a different situation.

Knowledge and skill acquired by the method of blind trial and error afford satisfactory guidance only in cases easily recognized as similar to those in which success has been achieved previously. One who has learned by this method will not be able to perceive the circumstances which alter cases. Even if he perceived them, he could adapt his knowledge and skill to the requirements of the altered circumstances, only by continuing the process of selecting the lucky hits from the misses.

Such a process of acquiring knowledge and skill

lacks the guiding light of intelligence. Even when one has gained practical success by this method he does not know why one attempt succeeded and the other failed.

One who has previously acquired the knowledge which enables him to understand the whys and wherefores of success will be able to go intelligently about the task of finding the right course of procedure under novel circumstances. If one has this kind of knowledge, when it occurs to him to try various lines of effort, he will be able to forecast more or less accurately the consequences of each line of action. He will thus be able to avoid much wasteful bungling.

The Theory of Salesmanship endeavors to bring into clear consciousness a knowledge of the *whats* and the *hows*, the *whys* and the *wherefores* of the art of selling. It aims to formulate general principles and to organize them into a system so that they will have the greatest practical usefulness in selling. It aims, not at a theory divorced from practice, but at a system of general principles which will furnish helpful guidance to the various practical activities of the salesman.

In this book the process of selling is carefully analyzed. A theory of salesmanship is developed so that the salesman can see the general principles which are to be applied in efficient selling. The salesman will master his art more quickly and will

become more expert in it by learning and applying these general principles.

The knowledge and skill which enable one to do a thing have a certain value. But unless one knows why he does the thing that way, he can not adapt his knowledge and skill to altered conditions which make it necessary to change the way of doing the thing. He can not adapt his knowledge and skill to doing other things.

One who knows why he does a thing in the way he does, and sees that the doing is a particular application of general principles, can do many other things which come under the same general principles. A knowledge of the general principles of selling makes one resourceful and adaptable.

The salesman who understands the general principles of salesmanship can instruct and direct others in selling. He has the sort of knowledge which helps the salesman to develop into a salesmanager.

SALESMANSHIP IS APPLIED PSYCHOLOGY

Why is it profitable for the salesman to study psychology? Salesmanship is an art. Though the salesman performs an economic function, the principles of his art are psychological. In the act of selling, the salesman deals directly with mental processes. Salesmanship is, essentially, applied general, individual, and social psychology.

Salesmanship is the ability to influence the mental processes of a person so that he will desire the serv-

ice, or the serviceable thing, offered to him and will perform the acts necessary to secure it. The art of selling involves applying to a special line of activity, under the conditions which govern there, the general principles which must be applied in any case in which one person seeks to influence the behaviour of another.

The art of salesmanship involves understanding of, and skill in influencing the mental processes which are the factors that determine the behaviour, or the actions, of the men with whom the salesman deals. The salesman must discover what interests of his prospective customers are concerned with what he intends to sell. What needs is it fitted to satisfy? What qualities of the thing to be sold fit it to satisfy these needs or interests?

The salesman must secure the attention of the man to whom he wishes to sell. By presenting suitable selling points, in the form of arguments or suggestions, the salesman must influence the mental processes of his customer so that he arouses a desire for the article and a conviction that the purchase should be made. He must not only see that the customer arrives at a favorable decision; he must also see that he definitely commits himself to the purchase.

Argument, suggestion, attention, interest, desire, conviction, and decision are mental processes. To clearly understand them one must study other

mental processes such as habit, memory, association, and thinking.

It must now be clear that in the act of selling the salesman is dealing directly with mental processes. The science which gives an understanding of mental processes is psychology. The salesman needs to know psychology in order that he may intelligently undertake to influence the mental processes and, through them, the actions of men. The master of the art of selling is the master of men. The salesman needs to know psychology as a means to the intelligent direction of his own life.

The general principles of the art of selling will be developed in Part I. This discussion will enable one to see what psychological processes are involved in selling, and how they are to be dealt with by the salesman. Parts II and III will give a clear understanding of the psychological processes with which the salesman has to deal. By means of illustrative examples, it will be made clear how a knowledge of these psychological processes will help to make one proficient in understanding and applying the general principles of salesmanship developed in Part I. It is obvious that much light should be thrown on Part I by reading it again, after Parts II and III have been mastered.

PART I

MAKING THE SALE

PREPARATION OF THE SALESMAN AND OF THE SELLING PLAN

This book aims to develop the general principles which underlie the art of selling. Special study is required to apply these principles in any special line of selling. Skill in the practice of the art must come from special study and carefully and intelligently directed practice.

The things one must do, in order to prepare to sell some particular thing, will vary considerably with the thing.

A detailed discussion of them would hardly be in order in a book which undertakes merely to develop and illustrate the practical application of psychological principles. It would be excluded on the ground that a work on general principles must not confine itself too closely to any particular line of selling. One who understands the principles should be able, by putting forth the necessary effort, to apply them to any special line.

PARTS OF THE SELLING PROCESS

In the complete selling process there is first of all the pre-approach. In the pre-approach one studies

the special needs and individual characteristics of his customer.

[In this discussion the term customer is used to denote the man to whom one is trying to sell. Strictly speaking, he may be no more than a prospective customer. Yet it is well to treat every man solicited as if he were a valued customer. The aim should not be merely to make a sale, but to make a customer. The sincere manifestation of this attitude has a suggestive force tending strongly toward making both the sale and the customer. The salesman, who has this attitude, will think of each man solicited as a customer. It will do no harm to call him so in our discussion.]

On the basis of the information gained, he formulates a proposition adapted to the customer's needs, and plans his approach and solicitation to close the circuit with the customer's interest. After this preparation has been made, the salesman undertakes the actual approach, in which he aims to secure attention to his proposition and an opportunity to present it.

If he is successful in his approach, he proceeds with the solicitation. During this solicitation he may display samples or make a demonstration of the article. The solicitation aims to stimulate desire for the article and to arouse an impulse to purchase it. As the salesman goes on with the solicitation he must dispose of any objections the customer may raise. He must skillfully diagnose the impression he is making on the customer's mind. He must feel

out the customer to see when he has reached the proper time to attempt to close. When the time is ripe, he must undertake to bring about the performance of the particular acts which the customer must perform in order to close the sale.

PRE-APPROACH

In selling a low-priced specialty, or article of general demand there may be little opportunity, or little need for the pre-approach.

The nature of the pre-approach may be made clear by the methods worked out for selling National Cash Registers. This pre-approach is divided into two processes, the investigation and the preparation.

The salesman is first instructed to make a note of things favorable to the success of the prospect's business. Among them are good goods, proper lighting, efficient clerks, desirable class of customers, etc.

The salesman should next investigate the method of doing business. He should find out the ways in which losses may occur. He may do this by observation, by conversation with the clerks, or even with the proprietor. To get the desired information from the proprietor it may be necessary to convince him of the importance of discussing his business with the salesman. In exceptional cases, by making a purchase, the salesman may secure information of much importance, which he could not get otherwise.

The investigation aims to give the salesman facts which will enable him to interest the merchant and show him why he can not afford to be without an up-to-date National Cash Register.

If the store is small, the preparation can be made

mentally, while the salesman is investigating. The investigation, the preparation, and the approach can all be made at the same visit.

If the store is large, the salesman should leave the store after his investigation and prepare a written analysis. For the largest stores this written analysis may be included in a written proposition. This proposition will give an explanation of the system proposed for installation, the location of the registers, etc.

The written analysis should list the good things found in the merchant's place of business. If the salesman unwittingly makes it appear to the merchant that he can see only bad things in the place and method of business, he puts the merchant in an antagonistic frame of mind. By recognizing and presenting the factors favorable to the success of the business, the salesman creates in the customer's mind an attitude which predisposes him to consider favorably the proposition presented to him.

The analysis should point out clearly how the system in use may be improved. It should show how the merchant lacks protection in the handling of his money, how he lacks sufficient information about his money, and why slow service exists.

The analysis should also give the cost of the proposed system. It may be well to compare the price with the cost of the system in use, or of some other system under consideration for adoption.

The written analysis, or proposition, may be used

in approaching the merchant to secure an appointment for a demonstration of the register. It should be thoroughly explained, and then turned over to the merchant and left with him.

The aim in the pre-approach is to enable the salesman to determine on a proposition, and formulate a plan of approach and solicitation. It enables him to present a proposition of such a sort, and in such a way, that the serviceability of what he proposes to sell will close the circuit with the customer's interest and needs. One can do this only as he understands the likes and dislikes of the customer, his point of view, his aims and ambitions, his financial resourses, the requirements of his business, etc.

With such information at his command, the salesman may make the aim of his appeal as definite as that of a rifleman shooting at a mark. Without such preparation the salesman must feel out the man he is soliciting by presenting more or less aimlessly a number of propositions and noting how they are received. His actions may be compared to a man shooting in the dark with a blunderbuss. With such a weapon it is more or less a matter of chance if any one of the missiles hits a vital point. When the projectile does strike the mark, it does not have much force, or penetration, or effectiveness.

The blunderbuss salesman reveals the fact that he is not master of his business. His random efforts make a bad impression which it is difficult to overcome.

Various firms employ persons other than sales-

men to make the investigation of the pre-approach. The New York Edison Company does so in planning to sell its service to displace that of private plants. A technically trained engineer makes a study of the plant to be displaced, as a basis for showing the advantage of using the central service. The data he gathers is then turned over to the salesman, who prepares it for use in the approach and solicitation. This plan is adopted because the engineer, as a result of his technical training, can do the investigating more efficiently than the salesman. The salesman can make better use of the engineer's data in the actual work of selling.

Some firms employ men, who work more cheaply than the expert salesman, to make the preliminary investigation, and locate prospects with whom it is desirable for the salesman to spend his time, and to furnish him with data to use in planning his proposition, approach, and appropriate solicitation. The problem as to whether the salesman, or some one else, is to make the pre-approach is a problem of marketing rather than of the psychology of salesmanship.

The pre-approach aims to adapt the general proposition to the needs and characteristics of the individual customer. It endeavors to gather data which will enable the salesman to formulate a proposition which will meet the real needs of the man to whom it is to be presented. It enables him to plan intelligently how to close the circuit with the customer's interests.

Sometimes an effort is made to prepare the man to be solicited, so that he will be favorably disposed toward the proposition of the salesman. Advertisements in periodicals, and papers, circulars, and letters can thus be used to pave the way for the approach and solicitation. The general principles of advertising and salesmanship must be employed in such an endeavor.

APPROACH AND SECURING ATTENTION

In his approach, the salesman aims to secure an opportunity to present his selling proposition to a prospective customer.

A correct approach means more than merely inducing a man to notice that you wish to sell him something. It involves getting him to lay aside other matters with which he may be occupied and to concentrate his thoughts on the proposition.

The approach is greatly facilitated by a prosperous appearance, attractive personality, pleasant voice, and courteous manners. What the salesman says and does should suggest that he has a forceful character, ability, assured and important position in the business world, geniality, humor, etc. His tactics should be based on a general understanding of human nature, and such knowledge of the customer as he could secure from others, or acquire by direct observation.

Every one is inclined to be inspired by a man who knows his proposition thoroughly, believes in it enthusiastically, and earnestly wishes others to know about it and to be benefited by it. If a salesman meets these requirements, he will have little difficulty in securing and holding the attention of men with whom it is worth while to spend his time.

Let us first consider the wrong way of going about it. Do not ask attention, as a favor, or say that you would like to secure attention for a little while. Never say "I wish to interest you in my proposition." Whenever the words "my proposition" are used they suggest that the salesman wishes to secure the attention for his own benefit. The salesman always should suggest that he is endeavoring to render a service to the customer. He will do this by manifesting a sincere belief in the serviceability of what he is endeavoring to sell.

Do not ask for attention. Attract it. Attention must not be attracted to the salesman, or by the salesman. Attention must be attracted to the selling proposition and by the selling proposition, if it is secured effectively. If the salesman can secure attention to a request for attention, he can secure attention to a statement or question about the proposition, aimed to arouse interest.

In dealing with business men, the salesman should never resort to cheap trickery indulged in by some canvassers, in order to gain admission to houses.

The introductory statement of the approach should be worked out as carefully as the heading of an advertisement. It performs a very similar function to that of the heading. It should make some statement about the proposition which will arouse interest in it and make it seem important enough to demand a thorough investigation. The best way to arouse interest in a proposition is to state definitely and clearly, but briefly, in what way the ac-

ceptance of the proposition will be of advantage to the customer. Awaken a foretaste of the satisfaction he will secure by making the purchase. Put the emphasis on the service the article will render. If necessary, support this with brief arguments or illustrations making clear the importance of the service. Show why he can not afford to refuse to investigate. Keep in your customer's mind what your proposition will contribute to the realization of his interests, if you can make your claims good. You can thus get him interested in seeing how and why the thing will do what you claim for it. A good approach will pass over naturally, and almost imperceptibly, into the solicitation.

If the salesman represents a business noted for the excellence of its products or merchandise, and for the efficiency of its selling force, he may attach some of this valuable prestige to himself, by bringing out clearly in introducing himself, that he is a representative of that business.

In his approach, a salesman of investment securities could well put emphasis on the large and certain dividends, the safety and convertibility of the investment, etc. The salesman of merchandise could dwell on the timeliness, style, quality, and price, which will make them sell rapidly and bring in large profit. The certainty of good business conditions in the near future will predispose a man to consider buying. When interest is aroused, the salesman should then present an article which he believes of-

fers a very attractive bargain, and proceed to make clear its attractive features.

If the conditions of selling are such that it is necessary to make an appointment to go with the man to some other place to see samples, or the demonstration of the article, it may be well for the salesman to be on hand at the appointed time to accompany him.

If a man meets the approach with the statement that he does not need the article, have ready an argument to show why he should reserve his decision until after he has investigated. If he says he is not interested, make it clear that you do not expect him to be interested until he appreciates the service the proposition will render him. The plea may be that he has no time to look into the matter. Remind him that the salesman's time is valuable to himself and his firm. The salesman could not afford to take time to talk to him unless he felt certain he had a proposition that would appeal to him as a business man.

If the customer is ill-natured, or in an antagonistic mood, make him forget it by talking about some subject he is interested in, outside your line of business. If you can not succeed in this arrange to call again.

Approach a man, if possible, when his energies are fresh, and his mind is free. If he is so occupied that he can not give you his full attention, make an appointment for a more favorable time.

The approach should arouse interest in the propo-

sition. If it fails to do this, the chance to sell is probably lost. Hence, the strongest and most attractive reason why the article should be bought, is not too good to use in the approach. The most successful fisherman is the one who uses the bait which attracts the fish most strongly, and displays it most temptingly. So the most successful salesman will be the one who, in his approach, presents the strongest selling points, in the most alluring way.

The reason why an article should be purchased, which may be used most effectively in the approach, as a means of attracting attention to the proposition and arousing interest in it, will generally have somewhat the form or substance of the general conclusion in regard to the desirability of the article, which the solicitation aims to establish.

Arousing interest merely means connecting the proposition with an already existing interest. The salesman can connect his proposition with an interest the customer already has, by showing him how it will contribute to the satisfaction of his need or desire, along the line of this interest. The salesman thus takes advantage of a tendency to desire already existing and stimulates and awakens it.

The following is quoted from the instructions given to the salesmen of a company operating a chain of cigar stores. It makes clear the spirit of courtesy every salesman should manifest toward those with whom he deals. The salesman who handles his customer tactfully does much to create good will for the store:

"Always—if there is no rush of trade—greet the customer when he comes in with a 'Good morning!' or 'Good evening!' or 'What can I do for you?'—or use any other polite phrase to welcome him.

"Call the customer by name, if you know it. A stranger should be asked to call again. 'I hope to see you again, sir,' and 'Don't forget us another time,' are good phrases to use. If you say the right thing the customer will surely think of you the next time he is in your neighborhood.

"After handing the customer his purchase and his change, say: 'Thank you, sir'; or, 'Much obliged'; or, 'Many thanks, Mr. So-and-So.' Two or three words of this kind must be said to let him know you appreciate the value of his patronage. Under our rules the customer who doesn't get thanked is cheated. Our customers go out saying: 'Nice chap, that!' "

"Get to know your customers by name. There is no need to ask a man what his name is, as though you were a police justice. You can say, after he makes his purchase: 'I'm glad to see you like that cigar, Mr. ——. Pardon me; but I know your face well and I'd like to know your name.' Then the next time he calls your 'Good morning, Mr. So-and-So!' will be a real welcome.

"Show everything you have in stock and suit your words to your actions. Give the critical customer a fair chance to make a choice without making him think you know better than he does.

"No matter what happens, unless forcibly at-

tacked never dispute with a customer. Let him talk as loud and as nastily as he likes. Keep your temper. Discuss the matter quietly. Swallow your anger. Cut out the rough stuff."

SOLICITATION

AIM OF THE SOLICITATION

To solicit means to seek earnestly with suggestions and arguments, with, or without, the assistance of a demonstration, to create a desire which will lead to the act of purchasing.

In the approach, the salesman has succeeded in attracting the attention of his customer to the proposition. He has made clear to the customer the service he proposes to render in satisfying his need or interest. He has aroused his interest by awakening in him a foretaste of the satisfaction to be secured by availing himself of the service.

The approach aims to create a desire for the service the thing will render. The solicitation aims to create desire for the thing, by creating the conviction or belief that it has qualities which make it a fit means of rendering the desired, satisfaction giving service.

The qualities which fit an object to render service are the characteristics, properties, or qualities, or features which give value to the object. What makes a thing serviceable we call, briefly, the value-giving qualities of the thing. They are the selling points of the thing.

The purpose of the demonstration, which will be discussed later, is to make clear why and how the

value-giving qualities fit the thing to render a desired service. These value-giving qualities are the talking points of the solicitation. They should be clearly and simply explained.

The talking points should be presented in the order most effective from the logical and emotional points of view. They should be so arranged that each leads naturally to the next. As far as the reasoning will permit, the points should be made in the order of increasing importance, so that the strongest will come last. If the points can not thus be arranged strictly in the order of a climax, each should be given prominence and emphasis according to its importance.

Talk quality first and then price. Quality includes all the properties, characteristics, or features which give the article commercial value. Quality, embraces all that makes the article desirable in material, construction, and design.

When a man has been convinced of the desirability of the article, he can be led to see that the satisfaction to be gained is commensurate with the expenditure involved, and that the price is therefore reasonable. Hence, price is a secondary consideration. It should not be mentioned until the demonstration of quality is complete enough to make it appear that the price is reasonable.

No matter how high the price may seem, the salesman should be ready to show that it is really low in comparison with the service the goods will give. It is, perhaps, hardly necessary to state that when

goods are being sold for resale, the service the purchaser is to derive, is not to be measured wholly by the margin of profit on each thing resold. The ease of selling made possible by an attractive appearance, or package, the qualities which tend to make a regular purchaser out of the casual buyer, and other things, add to serviceableness. Judged on the broad basis of serviceability an apparently high price may be lower than the smaller price of an inferior article.

If the price is asked before the salesman is ready to give it, he should say that he will come to that pretty soon. The price quoted will seem low, when the merit of the goods has been made clear.

The self-confidence of the salesman adds much to the effectiveness of the solicitation. He should appear confident of making the sale, but of course should avoid over-confidence, or presumptuousness.

The confidence which begets confidence in the customer, through suggestion, comes largely from an honest conviction that the sale will be of real service to the buyer, and from a consciousness of being fully prepared to grapple with the situation.

To avoid the embarrassment and fear of failure which destroys confidence, the salesman should have thoroughly mastered what he wishes to say and do in his solicitation. He can then concentrate his attention so completely on the things he is doing that there will be no place in his thoughts for paralyzing feelings of embarrassment, diffidence, doubt, or fear of failure.

It is folly to commit to memory a selling talk worked out by some one else, and to give it slavishly word for word. One is likely to give such a talk with much the effect of a little child saying his piece. A talk, so committed and used, is so stereotyped that it can not be adapted to the changing needs of the solicitation.

The selling talk, down to the smallest details of expression, should be carefully thought out in words. It may well be written out. Each argument used in making a point, or in meeting an objection, should be thoroughly mastered so that one will never be at a loss for what to say, or how to say it. To accomplish this do not depend on memorizing by rote.

Fix upon the germinal or central thought of each argument, from which you may think it out again, or redevelop it, when you wish to use it. This germinal thought, or central idea, will be the general topic of the selling point, or the answer to the objection. Express this general topic in the form of a suggestive phrase, or brief sentence, which will serve as a cue to recall the argument in detailed form when the circumstances are seen to demand its use. For example: this is the "prevents loss," or "reduces expenses" argument, or the answer to the "I want to look elsewhere" objection. If the carefully worked out details of the exposition, or argument, are thoroughly associated with the topic in the order in which they should be recalled, one will always have at his command, ready to use effectively, all that bears on the topic. When what is said

springs from such preparation, it comes with all the adaptability, spontaneity, and stimulating effectiveness of extempore speech.

When the various selling points have been carefully worked out and tagged with appropriate cues, the cues should be firmly associated in memory in the order in which they are to be used. Make the association links established between the various cues, in order to recall them, intelligible or logical, when possible.

The salesman should have the part his selling point is fitted to perform in making the sale firmly associated with its cue of recall. He will then be able to perceive when the situation developed in the solicitation makes it desirable to use a certain argument or exposition and can readily recall it. He should have mastered it so thoroughly that he can give it without much demand on his attention.

While making the point thus mastered, he can think ahead and plan to meet any unforeseen circumstances, which may make it necessary to change his tactics. When such circumstances are encountered, if one is properly prepared, he will recognize their significance. This recognition will bring into the margin of consciousness the cue of the argument he has worked out to meet this situation.

The situation unexpectedly encountered may be one not fully prepared for in advance. In that case he may find several thoughts starting to develop in the fringe of his consciousness. From these he can select the one which seems best adapted to meet the

situation. His many-sided preparation has given him resourcefulness.

STATING THE AIM IN TAKING UP A NEW POINT

The discussion of each new selling point taken up during the solicitation should begin with a statement of what is aimed at in developing the point. It is well to have in the customer's view from the first, the conclusion to be reached from the facts or value-giving qualities presented. A selling point may be regarded as a conclusion in regard to the value of a thing, to be established by reasoning from the value-giving qualities of the thing.

To prevent the customer's mind from wandering, the salesman should develop his subject in a natural and logical order, as rapidly as the full import of the points can be grasped. If the man's mind is not fully occupied in following the visual demonstration and verbal presentation, it may switch to some other line of thought. If the thoughts once get to running freely along some other line, the sale may be lost. At least some efforts have not been effective, and some of the work will have to be done over. Hence, to hold a man's attention, it is necessary to keep new aspects of the problem developing continually. During the solicitation the salesman should dominate the trend of his customer's thoughts.

The salesman should not permit himself to be drawn into conversation about irrelevant matters, while talking the sale. In such a discussion the effect of what has already been said will be lost. An

antagonistic attitude may also be aroused. Conversation about general topics should be had before or afterwards, if at all.

PUTTING THE MAIN POINTS IN WRITING

If a selling talk is long and complex, it may be well to write down each important selling point in plain view of the customer, and then proceed to develop it. The customer then sees at the start the point which is aimed at. The writing, in plain view, enables him to keep the general aim in mind and to more fully appreciate the bearing of what is said, as the solicitation proceeds.

With many customers the appeal through the eye is stronger than the appeal through the ear. The impression made through two senses is stronger than if made through either alone.

The attention is instinctively directed to movement or action. The observer experiences a strong curiosity to see what will be written. This impresses the writing clearly on the mind.

The points thus written down have a long time in which to impress themselves on the mind. They may be given additional emphasis by referring to them from time to time as the discussion proceeds. The written points will be convenient for making the final summary, when the time for closing is reached.

The customer feels different about a claim to serviceability when it is put down in "black and white". Such a claim can be verified. It must be fulfilled. It

commits the salesman to make good in a very definite way. Oral statements are frequently discounted considerably. A written statement can be taken to mean just what it says. Making a permanent record of a claim to serviceability is an evidence of sincerity and good will. The service afforded will be compared with the claims. The claims must be truthful.

The salesman who uses this device combines the simple, condensed form in which the advertisement sets forth the selling points of the article, with the adaptability and warmth of a personal appeal charged with enthusiasm. The salesman should study the principles of advertising in order to use this device successfully.

ADAPTING THE SOLICITATION TO THE CUSTOMER'S MIND

The customer can assimilate, or properly appreciate the bearing or significance of what is said in the selling talk, only by relating it to kindred knowledge he has gained through education and experience. The salesman must present his subject from the customer's point of view, and build on the foundation of knowledge already present in his mind. However, he must proceed to elaborate, enrich and transform this knowledge.

The genius of the salesman is manifested largely in the certainty and readiness with which he hits on the right interest and ideas in his customer's experience to use as an assimilating notion, or apperceptive mass, to which he can effectively connect, by rational links, the points he wishes to make. He must make clear the relations existing between the customer's interests, experience and knowledge and the new matter he presents, pertaining to the thing he is selling.

The salesman's ability to transmit to his customer his own conviction and enthusiasm, depends on his skill in building up in the latter a state of mind similar to his own. To accomplish this, the salesman depends upon exposition, argument, demonstration, and suggestion. The ideas which the salesman

presents tend to arouse in the customer's mind feelings similar to those which accompany them in his own mind. The enthusiasm and confidence manifested in the bearing, expression and talk of the salesman tend to arouse, through suggestion, a similar state in the mind of the man he is soliciting.

The salesman must not be contented with making mere general statements about his article. All such statements should be founded upon a broad basis of facts, or illustrative examples fitting in with the actual business experience and methods of the customer. A generalization is effective only when it is seen to be a conclusion drawn necessarily from an adequate foundation of facts. Such a generalization is full of significance and is dynamic.

EFFECTIVENESS CUMULATIVE

Thoughts, feelings, and volitions are controlled not merely by the idea in the focus of consciousness. All the elements in the dim background of consciousness, or that have been recently in consciousness, contribute their part in directing the mind's activities.

A well-developed solicitation sets to work a number of processes all directing their influence convergingly along one line, and all co-operating to bring about the desired act of closing. Each point made leaves behind it a trace of brain and mind activity, and a favorable emotional coloring. These persist as important factors determining largely the trend in the complex changing state of mind developing as a result of the selling talk.

Each point the salesman has made remains potent and effective while he is developing subsequent points. He thus builds up a constellation of marginal traces of previously made points, and of desire previously aroused. The effect of the appeal is cumulative. The persisting influence of the previous mental processes tends to fill the mind with a well-grounded belief that the purchase should be made. This influence also tends to prevent ideas of acting contrary to that belief from getting into the mind.

A properly worked-out selling talk can thus be

made cumulative in its effect. In a final skillfully arranged summary the salesman can stimulate to greater activity the persisting traces of previously made points, and direct their united force on the act of closing the sale.

In the act of closing, the customer's attention should be centered, not on the value-giving features, but on the act of closing. This will be developed more fully later on.

BRIEF SOLICITATION FIRST

In selling things which do not require a complicated demonstration or argument to make clear the service they offer it is well to make first a strong, but rather brief, presentation of the main selling points. Considerable material is held in reserve for future use, if the first attempt does not succeed. The first, determined, brief presentation may close the sale. In that case, to have used a longer talk might have lost it. At least, time and energy would have been wasted.

After making such a brief solicitation the salesman should sound his man to find whether he is ready to close. The methods of doing so will be discussed later. By thus feeling out the customer the salesman can find out what objections he will have to overcome. He will perceive along what line further appeal may be most effectively undertaken. He will discern whether he should aim to strengthen existing desire, or to awaken new desire, or whether

effort should be concentrated mainly on showing that the thing is best fitted to satisfy existing desire, or that now is the time to get it, or that the purchase will not involve too great a sacrifice of other interests.

RENEWAL OF THE SOLICITATION

If the salesman's first brief attempt is not successful, he should return again to the solicitation, profiting by the enlightenment gained. If he has written down the main points of his preliminary solicitation he should see that they are kept clearly in mind. As he brings into play material previously held in reserve, he should indicate its bearing on the main argument previously presented. He should finally summarize his argument in a form more condensed than his first brief presentation.

Price should not be mentioned until near the close of the solicitation, as the customer may center his attention on price when the salesman wishes to direct it to quality.

Incongruous, irrelevant, or frivolous matter should not be injected into the selling talk. A pause to let a point soak in should not be long enough to allow the customer's mind to get running along another line of thought. Tactics should not be changed too abruptly.

If the solicitation is interrupted at any point, continuity is likely to be lacking when the solicitation is begun again. When the solicitation is resumed,

the part gone over previously to the interruption should be reviewed briefly so that it will be present in mind in such form that the rest of the talk will connect with it properly.

TRUTH

To gain the greatest permanent success, a salesman should make it clear that his desire is to render such service to the purchaser that he will become a regular patron. The salesman selling to a merchant should know what style and quality of goods and what amount can be used most profitably by any particular customer and should give him the benefit of his knowledge. The seller should be fair, candid, and honest in his statements and honorable in his methods. He should guard carefully against making the impression that his chief concern is to make the sale, regardless of the interests of the purchaser.

A common practice among retail salesmen is to look closely for suggestions from the customer and to sell him whatever he may take a fancy to, even when he knows it would be better for him to buy another article. A better practice would be to give him honest and expert advice, so that his purchase would be permanently satisfactory. His good will and future patronage would thus be secured.

To illustrate this point, suppose a woman takes a fancy to goods that will fade in washing. If the salesman knows that a permanent color is required for the use to which she intends to put it, he should tell her that the color in question will fade. By so doing he may lose the sale. This would be better

than to have the purchaser feel that the store had sold her a gold brick, and mistrust it in the future. It is better to lose a sale than to lose a customer, or to create ill will.*

It is wise to appeal to the good judgment and intelligence of the purchaser. Such an appeal is pleasing to the one to whom it is made. Every one believes he is intelligent, and has good judgment. He is flattered when others see it and admit it. Such recognition and admission establish a relation of equality and confidence between salesman and purchaser. Frequently the customer will feel that the reason presented must be a good one, though he can not fully comprehend the significance of it.

*See the discussion of "Good Will" in the author's "Psychology for Business Efficiency."

DEMONSTRATION

What one sees in an object is determined largely by the interests dominant in his mind, and by his preconceptions, or misconceptions. Experiment has shown that one may fail to see very important and significant features in plain view. He may distort what is seen, or believe he has seen what is not there. He may fail badly to apprehend the correlations and significance of the qualities of which he becomes aware.

In order that a customer may get the right understanding of a thing, his observations should be guided and directed by the salesman. The salesman must see that he brings the right ideas to bear in interpreting the observations made. The demonstration aims to accomplish these things.

The demonstration appeals to the strong instinctive interest in observing what others are doing, and to the instinctive curiosity to know the significance of it. Seeing a thing done is much more interesting and full of meaning than hearing someone tell how it is done. Doing it one's self arouses still greater interest in it.

In selling many articles, the demonstration is a very important part of the solicitation. Its purpose is to make clear what value-giving qualities the thing has, and to show how and why they give it

value. It should be accompanied by a verbal exposition of the points of value in the thing and an explanation of the service they render. The solicitation supplements the demonstration with arguments and suggestions aimed to induce the customer to perform the acts necessary to secure the service.

The exposition aims to make one see the value-giving qualities of a thing, their functional interrelation, and how the customer's needs and interests are concerned with the service the thing is fitted to render.

In making the demonstration, one should not fall into the common error of assuming that because the customer's eye receives a retinal image of the thing, he therefore really sees how the qualities of the thing make it fitted to render service.

Seeing, in the sense in which the salesman wishes his customer to see the sample or article demonstrated, is a complex mental process. It involves a clear discrimination and a correct apprehension of the various value-giving qualities and their interrelations, and of the fitness of the thing as a whole to serve as a means of securing satisfaction. This can be accomplished only as the observations are properly guided or directed by the salesman. He must see that the right interest is aroused, and the right ideas are brought to bear in interpreting what is seen.

In making a demonstration, it is never safe to assume that any essential feature will be seen and

rightly understood, merely because it is plainly in view. Neither is it safe to assume that the significance of a thing will be present effectively in mind, merely because it must have been apprehended previously. Familiarity breeds indifference. All essential features, no matter how familiar they are, must be pointed out clearly in the demonstration. Their significance should be brought vividly into consciousness. Many things do not become at all clear until they are presented visually.

In demonstrating a cash register the salesman is not content with pointing out that the indicator shows the amount of each purchase. He makes clear how the indicator gives publicity to the amount, and how publicity enforces honesty. He dwells strongly on how the total sales check up with the amount shown on the recorder, and how this reveals dishonesty or error. He also brings out many other serviceable features in a similar way.

AROUSING IRRELEVANT IMPULSES TO ADD FORCE TO THE DESIRE FOR THE SERVICE OFFERED

The salesman sometimes strengthens the impulse to buy by arousing irrelevant impulses to re-enforce it. The practice is generally questionable, and often deserves strong condemnation.

In olden times the auctioneer began by offering his article at a high price, which he gradually lowered until the sale was made. A similar device is sometimes employed in window displays, in which an article is offered at a price which is to be lowered a certain amount each day until the thing is sold.

In modern times the auctioneer agrees to accept a low price if he can not succeed in his endeavor to get a better offer. The modern practice is more successful than the ancient one, because it affords the auctioneer an opportunity to arouse a spirit of rivalry. He starts competition. He awakens the fighting spirit. A man who is bidding in competition with others may often be induced to pay considerably more than he would offer at private sale. The fact that some one has offered a certain price tends to make others believe that it is worth more than that price. In this way the desire to buy is re-enforced with impulses which could not be aroused by a mere

setting forth of the value-giving qualities of the article.

A salesman working for an unknown insurance company had to spend so much time and effort explaining about his company that his efforts devoted to the sale of insurance had but little effect. He had to sell the company before he could sell insurance. When confidence and good will for a line already exist, they strongly predispose one to respond favorably to the solicitation. Whatever creates good will for the business re-enforces the solicitation. See "Good Will" in "Psychology of Advertising."

ILLEGITIMATE MEANS

Some salesmen endeavor to gain the good will of their customers by entertaining them at dinners, or shows, or ball games, etc. Such means may predispose some men to buy. However, they are irrelevant to the end in view and their use is more than questionable. It is but a short step from such persuaders to open bribery which, of course, puts the salesman beyond the pale.

Some salesmen come to rely on making concessions to the buyer, rather than on forceful solicitation in which the value-giving qualities of the article are presented effectively. By so doing, they reveal a great weakness, either in themselves, or in the line they are selling.

The possession of a large, powerful body suggests that the man has corresponding strength of character and ability. Such a person towers above his fellow-men. They tend to look up to him, literally and figuratively. He has prestige because of his size.

A big man loses much of his size prestige, if a little man with whom he is dealing is placed above him. Regardless of the relative size of the men, the salesman loses prestige in dealing with a customer, if he sits or stands so that the customer looks down upon him. If the salesman can not be seated so that his eyes will be above, or at least on a level with, his customer's, he should stand.

The salesman should not lounge or slouch. He should sit or stand in an erect and alert attitude.

The salesman must be able to meet the gaze of his customer frankly and unwaveringly. A shifting gaze and embarrassed attitude are manifestations of self-distrust and self-submission in the salesman. They are a confession of weakness.

The salesman's gaze, expression, and bearing should show self-assertion and self-reliance springing from reasonable confidence in himself and in his proposition. The salesman's manifested confidence, enthusiasm, and mastery of the situation, tend strongly, through suggestion, to arouse confidence,

enthusiasm, and self-subjection in the customer.

Selling is an important and serious business. The salesman should make his statements seriously and earnestly. His seriousness should not be grouchy or funereal. It should be good-humored and optimistic, but without the spirit of fun or levity.

The man who makes a serious statement and then giggles or laughs about it, destroys its effectiveness. Through suggestion he arouses an emotion in the mind of the customer which prevents him from taking the statement seriously and realizing its importance.

The salesman can get some hints for the effective presentation of his selling talk from manuals on public speaking and from teachers of the subject, and from studying good speakers to see what makes them effective.

Many factors contribute to effectiveness. Among them are clear perception of what one wishes to accomplish and an understanding of what ideas one should choose to accomplish it; the clear expression of these ideas in words and the arrangement of the words with due regard to logical sequence and emotional strength. Contributing to making these effective, are tone of voice, manner of speaking, gestures of head, hand, or body, expression of the face, attractive personality and the glow of honesty, earnestness, conviction, sympathy, confidence and enthusiasm manifesting itself by suggestion, in subtle ways, in the presentation of the selling talk.

The principles of argumentative exposition, of persuasion, and of rhetorical effectiveness, should be applied in arranging and presenting talking points. The persuasive presentation of the selling talk requires a personality and ability kindred to that of the successful orator or advocate. Knowing what to say and do is only half the battle. Half of its effectiveness depends on how it is said and done.

The salesman must secure conviction by well-reasoned proof, but he must not content himself with an unemotional assent to a chain of reasoning. He must arouse the feeling which will lead to action. The persuasiveness of his talk, as indicated before, will depend on what he says, on the logical and rhetorical effectiveness with which he says it, and on his personality and manner of delivery.

The salesman's argument is in the center of consciousness, but all the other factors previously mentioned help to build up around it, by suggestion, a fringe of emotional and impulsive elements which add greatly to its effectiveness, and prevent the occurrence of opposing ideas. Two salesmen may make pleas equally conclusive as far as their logical character is concerned. One may meet with mere intellectual assent. The other, through his emotional appeal, may arouse to decisive action. Hence, logical adequacy of subject matter must be supplemented by the other factors contributing to effectiveness.

We are not advocating overloaded attempts at fine

speaking. Buncombe, or frothy eloquence, will not fill the bill. What is needed is simple, straightforward talk, clearly expressed, and supercharged with the feeling which comes from the sincere and strong conviction of the salesman.

Business men are not carried away by mere plausibility. Build clearly the foundation of facts from which you wish your customer to draw his inferences. It is not sufficient to present good points. The solicitation must close the circuit of what is said with the interest already existing in the customer's mind. The proposition must be connected vitally and naturally with the experience and aims of the customer.

Secure emphasis by approaching the thing from a different viewpoint, and by expressing it differently, as well as by using strong words, or by repetition in the same words, or by emphatic delivery.

Strong speaking does not require big words. Big, strong ideas expressed in simple words and easily understood sentences are what is needed. Over 2000 years ago Tiberius Gracchus said: "The wild animals of Italy have their dens and lairs. The men who have fought for Italy have air and light, nothing more. They are called masters of the world, though they have not a clod of earth they can call their own." Men who can conceive and express strong appeals to interest in simple form like that do most to move the world. They move the world

because they make a direct and easily comprehended appeal to the universal interests which grip the hearts of men.

Of course, when one is talking about a scientific subject to men of expert knowledge, he must use technical terms. Ordinary words are generally too vague, indefinite and ill defined in meaning, to meet the demands of exact explanation under such circumstances. Big words which express big ideas are all right in their place. Men versed in science are repelled by an attempt to express its ideas in the loose and poorly defined words of ordinary speech. Each new idea in science demands that a new technical term be coined for it, or that an old term be used in a new and definitely defined meaning.

Spencer sought to establish that "Evolution is the transition from an incoherent, indeterminate homogeneity to a coherent determinate heterogeneity, through a process of differentiation and integration." Some men have held this definition up to ridicule on account of its technical difficulties. But it set forth Spencer's idea in a form which was highly satisfactory to the class of readers to which it was addressed. Hence, it was used with appropriateness and good effect.

One should use technical terms when he wishes to sell scientific apparatus, or complicated machines to technically trained men. One should not hesitate to use scientific terms when addressing men well in-

formed on the subject. One should not be repelled by technical terms or treatment when he is trying to master the exact knowledge of a technical subject, such as psychology. Such a subject can be adequately presented only by using such terms.

The salesman should not present his selling talk in the form of a challenge for a debate. He should not argue with his prospect, or flatly contradict him. Avoid destroying confidence by too strong statements or by running down a competitor.

DIAGNOSIS

When a salesman is presenting a business proposition to a man, he tries to understand his thoughts, feelings, mental attitudes, and prejudices. He endeavors to estimate their influence as factors in determining whether the proposition will be accepted. He tries to diagnose the mental state of the man.

There is no science which will enable a salesman to predict how any particular man will think, feel, and act in regard to his proposition. Acquaintance with the individual, alone, will give that power. The minds of all men work according to the same laws. The salesman is interested in getting men to do certain things by influencing their minds. Through knowledge of psychological laws he will gain insight into their minds and skill in convincing and persuading them.

A knowledge of psychological laws will assist the salesman, as he proceeds, to estimate the effect his course is having. Such knowledge will help him to steer clear of obstacles, and to tell when he has worked his man up to such a point that he is warranted in pushing the matter to a definite conclusion. Knowledge of psychology, alone, will not enable a man to do this; such knowledge must be supplemented by a thorough understanding of many types of individual character.

Insight into the minds of men may be increased by studying sociology, political economy, political science, history, literature, etc., or by anything that increases one's general knowledge and culture. But skill in reading character and in correctly apprehending a customer's state of mind must come largely through a wide acquaintance and intimate association with men of all classes. One learns to deal with men through actual experience in dealing with them. A knowledge of the laws to which mental processes conform enables one to profit more by this experience. It enables him to perceive the significance of what he sees.

If one has the right sort of natural ability, a knowledge of psychological principles supplemented by wide experience with men, clarified through painstaking effort to rightly profit by it, may develop in him a judgment so accurate and prompt in sizing men up that it may be said to be intuitive. What is known by intuition is perceived directly and with certainty, without the necessity of going through long or complicated processes of thought. Such intuitive judgment is based on certain things actually observed in the expression, bearing, acts, or conversation of the person to whom it applies. We may not be able to tell clearly on what such judgment is based. Such is often the case when we say to ourselves, in regard to a man we have just met for the first time, this man is honest, selfish, or generous. Generally we would be very much at a

loss if we attempted to justify to ourselves, or to others, such judgments in which we confidently believe.

When we thus say we like, or dislike, or suspect, or trust a person on first sight, or say that we believe he is stingy, or generous, or honest, or dishonest, or conceited, or stubborn, or what not, our judgment may be based on some undefined characteristic, observed, but not clearly discriminated, from the other elements of the general impression. We vaguely recognize a characteristic which has been an element in some personality which experience has shown to have the traits we attribue to the person now under consideration.

Just as doubt or conviction in your own mind will manifest itself in modifying your action, so will duplicity, knavery, uncertainty, desire, conviction, etc., manifest or express themselves unconsciously in the attitude, acts, countenance, or tone of voice of the person in whom they are found. Such expressions are the things on which our so-called intuitive judgments are based. Instinctive capacity and capability developed by experience are both factors which contribute to this ability.

Such judgment, based on what is observed in the ordinary ways of expression, must not be confused with telepathy, mind reading, or thought transference as it is variously called. It is generally agreed among psychologists that telepathic communication is an established fact. It is also agreed that it is so

rare and undependable in its manifestations that it offers no help to the salesman.

It is not difficult to understand the parts of psychology with which the salesman is most concerned, the difficulty comes in making the principles practically helpful. When what has passed through the mind is reviewed it may be seen that the activities have conformed to psychological principles. We can generally say why any particular state has followed the previous state. Psychological hindsight is comparatively clear and certain, but psychological foresight is far less easy. For example, what is present in a man's mind will be followed by some idea previously associated with it, or resembling it; but this does not enable one to tell what particular associative connection or resemblance will prove effective in suggesting the idea which is to follow. Psychology gives the laws in accordance with which ideas, feelings and volitions occur in the mind, but does not enable one to foretell with certainty what particular mental states will occur.

Psychology teaches the "how" of the mind's working. It enables the salesman to do, with more or less certainty and assurance, what he would otherwise undertake blindly. Experience, guided by a knowledge of how the mind works and by an understanding of the principles of salesmanship, enables the salesman to undertake intelligently the task of starting with a given content in the mind of the customer, and influencing his thoughts and feelings

in such a way that he is ready to close the deal.

The psychologist's attitude is abstract and analytical: the salesman's is concrete and practical. In a sense, the attitudes conflict and it is rather difficult to combine them successfully in one mind. Psychology is a science, salesmanship is an art. The relation of psychology to salesmanship is much closer, but it resembles somewhat the relation of biology and chemistry to medicine. It takes acumen, ingenuity, and practical ability to make original, successful applications of such fundamental sciences to the development of the art. But after the applications have once been made, many who could not have made them, may profit greatly by applying them in their practice.

Successful salesmanship will conform to the laws of psychology, whether the salesman has learned them from the study of the science at first hand, or from studying the applications of psychological principles made by others, or whether his observation and experience have brought him to conform to these laws without definitely formulating them. A knowledge of psychology should prove helpful in developing the best methods of salesmanship.

Since understanding the man as an individual is very important, the salesman will often secure helpful knowledge by trying before soliciting him, to find out in the pre-approach, something about his methods of doing business, his strong and weak points, and even his interests, outside his business

lines. Frequently it will be impossible to get any helpful knowledge of this sort. The salesman must then depend on carefully observing the man while making his approach, and while soliciting him. Perhaps, if the man is not too pressed for time, he can engage him in conversation for a few moments, and feel him out in a general way before he gets down to business. He can thus combine the pre-approach with the approach.

The man to whom the selling appeal is made is generally on the defensive and tries to keep the salesman from perceiving what he really thinks and feels about the proposition. Since the salesman's efficiency will increase as his insight into the contents and workings of men's minds increases, he should avail himself of every resource that will be of assistance in penetrating this defense and discerning what is really taking place in the man's mind. He must not merely understand the laws in accordance with which the minds of men work, he must be able to comprehend the ideas, notions, interests, prejudices, likes, dislikes, beliefs and impulses of the customer as they manifest themselves in his mind during the solicitation. He must discern his customer's wants, what he knows, and does not know about the thing offered for sale, and how he can be most effectively influenced. Such are the things which will determine how the customer responds to what the salesman says and does.

The salesman must size up his man early in the

game and see clearly, and be guided by, the effect he is making. As the solicitation proceeds he must judge of the progress he is making by noticing carefully what the customer says, and does not say, his tone of voice, the expression of his eyes, and countenance, and his actions. Of course, the salesman can not be guided by what the customer says, unless he allows, or even encourages him to talk. Success in interpreting these manifestations depends not merely upon familiarity with psychological laws, but upon tact, intuition, insight, and ability to read individual character coming from a wide acquaintance and experience with men.

Ingenuity and resourcefulness, a forceful and pleasing personality, wise aggressiveness, and ability to inspire confidence in one's self and in what one is selling are essential to great success. The salesman should be a complete master of his line, not only in all its details, but in its general bearings as an economic force and in its relations to other affairs. When he is thus equipped and has the ability to diagnose the effect he is producing, he can select talking points adapted to the man with whom he is dealing, arrange them effectively and present them with telling force.

While proceeding with his selling talk the salesman may often find out what effect he is making by asking appropriate questions worded so as to suggest assent to them. Such questions are "Have I made clear to you the great advantage of this

feature?" "You see, now, don't you, why there is such a great demand for this article?" "If the matter is properly presented to him, it doesn't take a man long to see that this offers a rare opportunity for profit, does it?" "Isn't this a reasonable conclusion?" Such questions tend to secure assent to the cogency of the reasoning and the validity of the conclusion. By noting the answers to questions and noticing carefully the expression and general attitude of the man the salesman can tell whether he remains doubtful, or is being convinced.

It is often advisable, as explained previously, to make a brief, condensed appeal at first. After this the salesman can feel out his customer to see how the appeal has influenced him. He can then adapt the rest of his solicitation to the state of the customer's mind revealed by this diagnosis.

The salesman should study men as he reads about them, plays with them, talks with them and does business with them. Such study should enable him to put himself, in imagination, in the other man's position, and thus to understand him to judge whether the customer is in a state of indecision or whether confidence has been established; when to confine himself to straightforward matter of fact business talk, or when to use subtle suggestion or finesse, when to follow, and when to lead or use strenuous methods.

On the whole, sufficient uniformity prevails, amid the great diversity of individual character, that cer-

tain methods will work well with nearly every customer. In most cases it will be wise to stick to "the one best way" until good reasons are seen for adopting an unsual course.

As the salesman is presenting his selling points in his solicitation the prospect endeavors, from time to time, to consider them in comparison with ideas bearing on the subject coming into his mind through association; but he will not be able to do this very deliberately, if the salesman is presenting his selling argument effectively.

As the salesman makes each point and asks the man for his assent, he invites him to deliberately weigh the reasons for and against and to decide on the basis of the strength of evidence. When the salesman has finished his main demonstration and presentation and undertakes to close, the man will endeavor to balance the reasons why he should purchase presented by the salesman, against the objections or reasons why he should not, which have occurred to him in the course of the solicitation. If the salesman has not already discovered what these objections are, he should bring them out by appropriate questions.

DEALING WITH OBJECTIONS

When a salesman has succeeded in arousing a desire for an article, he is often prevented from closing the sale by an objection present in the customer's mind. Such objections are technically known in psychology as inhibiting ideas. As long as such ideas of considerable importance are even lurking in the margin of a man's consciousness he will not close the sale. Hence, objections are important things for the salesman to consider.

The salesman should know in advance what objections are likely to arise in the mind of the prospect. The selling talk should be carefully worked out in advance to take the wind from the sails of opposition by anticipating and forestalling such objections as completely as possible. But, no matter how carefully the salesman has planned his selling talk, he will meet with opposition. To overcome this, he should have worked over very carefully in advance the answers to all objections that are likely to arise.

The objections will vary according to the nature of the article which is being sold, and its relation to the needs, interests, and desires of the buyer. Just as it is important for the salesman to select the value-giving features or qualities of what he is selling, and to determine to what interests of the pros-

pective buyer these qualities will afford a means of satisfaction, so it is equally important to find out what interests of the man are giving force to the ideas which serve as objections, and inhibit or keep him from buying.

Of course, the man may refuse to close merely because he is not yet convinced that the article offered is the best suited to satisfy the desire. He wishes to give further consideration to competing articles. The rivalry is simply between competing ways of accomplishing the same thing.

The rivalry may be between competing lines of satisfaction for the same interest. For example, if he buys an automobile as a means of satisfying his desire for recreation, he can not take a contemplated trip to Europe as a means of satisfying the same desire. Or, it may be that the satisfaction of the desire is not believed to be a matter of sufficient importance to offset the loss of the satisfaction of the other interests which must be sacrificed if the purchase is made. A competing interest gives force to the objection. For example, if I buy an automobile, I can not satisfy my home-owning interest, or my interest in accumulating money and being free from debt, or my interest in enlarging the scope of my business.

After the first brief presentation of the article, while the salesman is feeling out the customer, to see if he has reached the psychological moment for closing, the customer will probably avail himself of

the opportunity to offer such objections as have occurred to him. If he does not do so, the objections may be brought out by appropriate questions. An objection so raised gives the salesman insight into the prospect's attitude toward the proposition and affords an opportunity to connect the selling argument vitally with his trend of thought and feeling.

The salesman should not appear annoyed because the objection has been raised. He may say that he is glad he is dealing with a man who wishes to consider every side of the proposition, for it is one which appeals strongly to such a man. Let him feel that the objection is natural from his point of view, but proceed to change his point of view. However, show him that your point of view is right rather than that his is wrong. Never enter into a debate with the man or flatly contradict him, as you may arouse his combative spirit and make him feel that it is a point of honor with him not to yield.

In encouraging a man to argue, you bring into the focus of consciousness, ideas which suggest courses of action contrary to the one you wish to bring about. You start a line of thought which will allow all the interests you have created to die out. You are encouraging a man to try to think of every possible argument to support his point, when you should be trying to make him forget them. If the objection is the result of a misapprehension, remove the misunderstanding from which it arose.

When an objection is raised, face it fairly and

squarely. Answer it then and there if you can do so convincingly. An attempt to evade an objection, or a failure to meet it fairly may cause such action to be regarded as an evidence of weakness in the proposition, or a proof of incompetency in the salesman. If you can not fully answer the objection, say that you see clearly the point that has been raised. A great deal of its apparent weight will be removed by a clearer insight into the proposition. What little real force it has, is so far overbalanced by the advantages of the proposition that the objection raised will be seen to be a factor of very little importance. Minimize the importance of such an objection as fully as possible, and then rely on an effective presentation of the advantages of the article.

If much attention has been given to the consideration of the objection, it may be well to recall the advantages previously presented before proceeding with the selling talk. Perhaps a point of advantage can next be brought up which will greatly offset any force which may still be felt as inhering in the objection. It could be introduced with the remark, "Here is a very decided advantage which will appeal to you strongly along the line we have been discussing."

If the objection has been raised prematurely and can not be answered at that point it may be best to say "I believe you will find that matter satisfactorily disposed of when I have finished," and then

proceed with the solicitation, meeting the objection at the proper time.

What shall we do with an objection which we suspect of being present, although it has not been expressed? Even if one feels certain what the unexpressed objection is, he should not try to dispose of it by direct attack unless he is sure he can completely demolish it with unanswerable arguments. An unexpressed objection is probably lurking in the margin of consciousness. An unsuccessful attempt to answer it would merely bring it into the center of consciousness and thus greatly strengthen its force. Rather than attack an unexpressed objection which he can only half meet, one should depend on making his proposition so attractive that the customer's attention will be centered wholly on it, and the objection thus neglected will pass entirely out of mind.

Never suggest an objection for the purpose of refuting it, thus hoping to make your case stronger. One who does so may be suspected of setting up a man of straw merely to show how easily he can knock him down, or worse than that, to be endeavoring to distract attention from some real weakness in the proposition.

If the man will admit that the proposition is one that will bring him financial profit, but objects that he can not afford it, show him the loss of profit which will result from delay. Make him see that the article will begin paying for itself as soon as it

is obtained. If you are selling him the satisfaction of some interest other than that of making money, impress on him strongly the satisfaction he will lose by postponing the purchase.

Suppose a man intends to buy, but that he does not close because he has made up his mind to investigate more fully, from fear that he may overlook a better bargain. Should one attack competitors, or try to show that their lines are inferior? An attack on a competitor or his line, might arouse suspicion that you feared to have the customer look around. This would increase his desire to do so. There is a motto which may throw light on the matter by approaching it from another point of view. It is "If your competitor talks about you put him on your pay roll. It doesn't matter what he says as long as he talks." When he talks unfavorably about you he suggests that your competition is affecting his business seriously. This suggests that one may do better by seeing such a competitor. People are likely to resent an attack which seems unprovoked and which is made under such circumstances that the one attacked has no opportunity to defend himself.

If you wish to explain the difference between your article and some other, you may say the competing article is inferior in appearance, usability, durability, etc., or you may say that your article excels in appearance, etc. The latter is better. Attract attention to the superior merits of your article

rather than the demerits of the other. When you meet competition, put your emphasis not on demolishing it, but on making clear the strength of your own claims.

If you attack the idea of looking elsewhere, you may merely bring it into the focus of consciousness and make it more effective in controlling action. It would be better to appear perfectly willing to have him make a thorough investigation. Express your confidence that no competitor can surpass your offering in real merit. Your bargain will appear more attractive after the other things are seen. It may be well to talk about something else for a little while. Then return to your article, paint it in attractive colors, make your enthusiasm about it and confidence in it so clear that you will inspire a like feeling in your customer. Make your proposition so attractive that it will fully occupy the focus of consciousness. Make the desire for it so strong that the inhibiting ideas will pass farther and farther into the margin of consciousness, until at last they fade from view and lose their force completely. You have then, in the terms of technical psychology, dissociated the idea of the act you wish to have performed from the idea of acting in a contrary line, which prevented or inhibited the performance of the desired act. Then is the time to make a suggestion directed toward closing the deal.

The most successful salesman is the one who presents his selling points or reason why, so skillfully,

so enthusiastically, so convincingly that the attention is so fully occupied with them, that reasons why not do not come to mind. A salesman who consciously or unconsciously suggests objections is greatly increasing the difficulty of making the sale. It is often easier to anticipate or avoid suggesting opposing ideas than it is to deal with them after they occur.

MAKING KNOWN THE PRICE

If you succeed in arousing desire, you will no doubt lead the customer to ask the price. If he thinks it is too large, be prepared to show him it is reasonable; considering the satisfaction, saving or profit which will come from the article.

If he asks the price before you are ready to tell it, tell him you wish to make clear to him what it will do for him before you tell him what it will cost. Say you wish to make his understanding of the proposition so clear that he will be able to pass a correct judgment on the reasonableness of the price. If the customer is told the price prematurely he will be thinking about price when he should be thinking about quality.

FEELING OUT AND CLOSING

The fiat, or decision, or act of will performed by the customer in closing the sale consists in consciously dismissing or disregarding all ideas tending to oppose the deal, and in decisively accepting the proposition and giving the attention freely and fully to the performance of the act necessary to closing. Closing is cutting attention loose from opposing lines of action and centering it on the act of purchasing.

If the suggestive force of the solicitation has been strong, even if opposing ideas prevent the full performance of the act of closing, the act is at least incipiently performed. That is, faint tendencies to perform the act are manifested in the appropriate organs. These tendencies will at once pass out into the complete performance of the act, if the customer can be led to turn decisively away from further consideration of opposing ideas. The natural impulsive power of the idea of the action then becomes fully effective in bringing about the performance of the action.

To get the customer into a state of mind in which he is ready for closing, the salesman must keep his attention centered on the attractiveness of the bargain he offers, not on his own desire to sell. Every point he has scored in his solicitation,

whether in creating confidence in the integrity of his firm, in the desirability of the service it has to offer, in his own knowledge, honesty, and judgment; or in making clear the quality, style, value, or other desirable features of what he has to offer, each point, if properly made, will have suggestive force persisting and converging toward the act of closing.

The sale may be lost by talking too long, as the salesman may thus suggest some idea which may again arouse a state of indecision in the mind of the customer who has practically decided to buy. The salesman must judge from the words, attitude, manner, and expression of the man, when it is best to endeavor to close.

The so-called psychological moment for closing is when the customer has become interested and convinced and feels a desire and impulse to purchase, then the time is ripe to make the attempt to close. To bring about this state of mind, the salesman, toward the close of his solicitation, should hold the attention of his customer centered on the most attractive features of his proposition, by enthusiastically presenting his strongest selling points in brief review, or summary form.

To determine whether the time is ripe to make an effort to close, the salesman must employ what we have called feeling-out suggestions. He may thus sound his customer by making a suggestion to action which, if carried out, implies willingness to make the purchase. Generally the suggestion is made by

asking a question of such form that the customer shows willingness to close if he gives the suggested answer. Examples of feeling-out questions will be given later.

The suggestion that the customer definitely commit himself, gets its effectiveness, not through the force or persistency with which it is made, but as a result of the proposition commanding the interest and attention and arousing the desire so fully that it excludes all thoughts or tendencies to act in a contrary line. To prefer the proposition is to attend to it to the exclusion of other lines of action. To make the act of choice is to cut loose from opposing ideas and center the attention wholly on the thing chosen. When the attention thus centers itself on the act of purchasing, the recognition of the desirability of making the purchase becomes the fiat of the will that the thing be purchased. The customer then says the decisive word, writes his check, or signs his name, or does whatever else is required to close the deal.

When this stage in the solicitation has been reached the salesman should not ask "You don't want to buy this, do you?" or even "Will you buy this?" He should act as if he were reasonably certain he would do so. His tone of voice, words, manner of expression, and actions should all show that he is confident of making the sale. He should make his question serve as a suggestion that he buy. "This looks like a good proposition. How many will

you need?" The salesman can handle the goods he is displaying, or his order book in such a way that he will make clear his belief that the sale is as good as made. But great tact is required not to offend the customer. It is only a short step from the attitude of the salesman confident for good and sufficient reasons, to that of the conceited and presumptuous fool.

If the salesman feels that the man is about to turn him down, he should lead him to talk about some unrelated matter he is interested in, such as baseball, the theater, church, or politics. When he feels that he has got him in a favorable state of mind, he should again present his subject with renewed enthusiasm and see if he can not carry the man along with him.

In feeling out a customer to find out whether the time is ripe to attempt to close, the salesman should ask him questions which will reveal the state of his desire in such form that the answer suggested would commit him to making the purchase. These questions should be framed so that they can not be answered by yes or no. Such questions are, "Which style, or finish, or model do you prefer?" "How much do you think you can use?" "How soon would you want it?" The insurance solicitor can say "When will it be most convenient for you to take the examination?"

The customer may ask from the salesman questions which would bring from him answers he

should get from the customer. The situation may be handled in this way: If he asks the salesman which style or model he prefers, he can say "That is a matter of individual tastes and needs. Which do you think would best satisfy your needs?"

If the customer makes a selection, put it down at once. After you have closed the deal you can return to this point and rectify the mistake, if you think one has been made. Or you can rectify it then and there, but after it is down. Of course, the salesman should give the buyer the benefit of his wider experience and greater knowledge of the thing he is selling, and sell him what is best adapted to meet his needs, not what he may wrongly have taken a fancy to, through a mistake in judgment.

If the customer asks how soon he can get it, ask him how soon he will want it. If he says right away, say "All right, we'll wire the order right in and have it sent immediately by express." If he asks what terms he can secure, ask him what terms he would like. When he has indicated his preference, as to style, quantity, date of delivery, etc., put them down and say, "All right, sign right here, so that there can be no mistake about the details, and we'll have it here promptly."

In closing an insurance solicitation the following procedure might be followed: The agent could secure assent to his proposition by some such statement as the following, summarizing the main points

of the appeal: "Mr. Blank, I am sure you will agree with me that every man ought to secure himself against business failure and provide for a comfortable old age. He ought to take every precaution to see that his family will be protected against hardship after his death. I have shown you an absolutely safe and sure means of accomplishing these things. I believe you see that the $5000.00 endowment policy I have explained to you will meet your demands satisfactorily. Your signature on this application (as he presents the blank and a pen for his signature) will insure this protection for yourself and your family. Be sure to write your middle name in full." The presentation of the blank and pen, and the remark about the middle name, center the attention on the act of closing. They suggest strongly that the act be performed.

If the man hesitates to sign, the agent should again summarize his main points, presenting them in his strongest way, and show him he is urging him to take a step in line with his dearest and most important interests. He should show that any sacrifice he may be called upon to make in buying this protection is so small that it may be disregarded in comparison with the satisfaction of knowing that his business is safeguarded, comfort is provided for old age, and those he holds dearest are protected against hardship.

In attempting to secure the signature the agent should place the order which he has made out as the

points were agreed on, in a convenient position for signing, should indicate the place for the signature and offer the pen to the man as he says "Sign right here, please." If the man hesitates the agent should add, while still holding the pen and blank in such a way as to suggest signing, "We'll have it here on time and you will be even better pleased with it than you anticipate. You will look a long while before you find a better bargain than this." Of course, it is hardly necessary to say that the remarks given above can not be comitted mechanically and used in every case. We are trying by means of illustrations to suggest general principles which may be applied in ways adapted to varying circumstances.

The request for the signature must be made very tactfully to avoid giving offense. The customer will naturally resent very strongly anything that suggests that his word is not as good as his bond.

To avoid such an implication, as he places conveniently before the customer the order he has filled out and offers him the pen the salesman can say: "Please sign here to show that this order is correct," or "to O. K. it," or "to approve it," or "to authorize us to send it to you." On the order presented for signature the salesman should have written the "O. K." or "Approved," or "Authorized," so that the buyer can conveniently sign his name under it.

The retail clerk could attempt to close with his customer by asking "Which quality or pattern do

you prefer?" "How much do you need?" "Will you have it sent out?" He could lead on a hesitating customer by such remarks as "You won't find a better bargain or a more becoming style than this." etc.

In attempting to close, take for granted, but not in a presumptuous or conceited way, that you have made the sale. The answers to the questions you ask, or the responses to the suggestions you make will guide you in further efforts to close.

Sometimes it is necessary to attack directly and overcome a determination to delay the decision until some future time. The salesman must show that the decision should be made now. The customer has all the evidence clearly in mind. He feels its full force. He is in a better position to decide now than he will be later on, when some of the important features will no longer be clearly grasped.

You have made a careful examination of this proposition. You are convinced that this article is all, or more than is claimed for it. You are conscious of a strong desire to secure it. You believe that purchasing this article will further your best interests on the whole and in the long run. Why should you delay. Your vision of your true interests is clearer now than it will be later on. Now is the accepted time. This opportunity is open to you.

The successful man is the one who has the strength of will, the decisive character, and courage of conviction which lead him to reach out and grasp the opportunity for profit when it is offered. By

embracing this opportunity you will put yourself in a position to grasp other opportunities later on. In the past you have no doubt regretted that you did not inconvenience yourself a good deal to take advantage of opportunities offered, which your deliberate and better judgment told you would turn out well.

Your success has come from promptly taking up good things when they were offered. I am absolutely sure that this proposition is to your advantage --that it will do even more for you than I have claimed. My reason for insisting now is that I am more interested in your future success and good will, than in putting through this particular deal.

I would not be acting in accordance with the true interests and permanent prosperity of a valued customer if I did not urge you to grasp your opportunity when it is offered. Your interests are identical with my own interests and the interests of my firm. We wish you to build up your business so prosperously and to derive such satisfaction from selling our goods that you will be on the market for larger orders in the future.

Our future growth and prosperity is absolutely dependent on the increased business and profit of our customers. I am urging this matter on you so strongly because I know that here is offered to you a great opportunity, and I know that your acceptance of it will bring mutual and lasting satisfaction to both of us. Feeling as I do, I would be disloyal

to your interests and those of my firm, if I did not urge you with every resource at my command to embrace this golden opportunity for profit. I am sure you will follow your own best judgment and grasp this opportunity leading straight to great and lasting success.

I recommend that you try about this amount. You will dispose of it so readily that you will want more in a short time. Shall we make the order for this amount? Of course, when the words "this amount" is used above, the salesman must state the quantity, amount, style, or type of article he honestly believes the man can handle successfully. The talk should be adapted, all the way along, to the thing offered for sale.

If the man objects that the amount mentioned is too large, show him that the experience of other men similarly situated has been that if only this amount is ordered, it will be necessary to reorder in a short time. If an advertising campaign is being carried on to assist in selling the article, show him that it is bound to create a large demand. Suggest to him ways in which he can display, or advertise the article so as to dispose of it profitably, etc.

If he objects that it costs too much, make clear the difference between an expense, which brings in no return, and an investment which will increase profit or reduce expense. If you are selling the satisfaction of some interest other than that in wealth, show that the satisfaction he will derive from

the purchase will more than offset the sacrifice in purchasing it.

Suppose the man is satisfied with the line of goods, but will not close, though it seems probable that he will do so later on. The salesman could leave an order blank with him to use in sending in an order, though there was not great hope that he would use it without further solicitation. It will at least suggest strongly that he is desirous of getting the order and confident of securing it later on. The confidence as expressed may help hold him in line when he is approached by competitors.

The salesman can do something toward retaining the interest he has aroused, by asking him to remember that his goods have the quality which give satisfaction, and selling points which make them easy to sell. This is the line he will ultimately buy. Make it clear that you can give him pointers which will enable him to handle your line successfully. Get the advantages of dealing with you so firmly associated with the general line of goods that when he thinks of ordering in that line he will think of your line. Get his assurance that he will give you another chance before ordering.

AFTER CLOSING

When the sale has been closed, the best course for the salesman, as a general rule, is to let well enough alone.

In many cases the salesman's task is not ended when the sale is closed. Frequently the objections, or doubts, or inhibiting ideas which were lurking around unnoticed in the dim margin of consciousness, kept out of the center of consciousness by the effective solicitation of the salesman, will crowd triumphantly into the spotlight of consciousness as soon as the salesman has left. Fears and doubts and regrets will fill the purchaser's mind. Don't leave your customer in a doubtful, over-persuaded, or half-convinced state of mind, with a lurking fear of failure which will partially paralyze his efforts and make the transaction a bad one for him.

Leave the purchaser confident that he has made a good bargain. Give him suggestions as to how to make the most of it. His effectiveness in pushing your line will depend on his confidence in it. A hopeful outlook founded on a reasonable basis will make success practically certain. A few well-directed suggestions tending to start the customer's thoughts to working along the line of developing his proposition in the most effective way will help materially to keep the paralyzing devils of doubt from

getting a prominent place on the mental stage. The salesman can thus pave the way for the success of his customer and for future sales for himself.

Just as the physician can contribute materially to the recovery of his patients through suggestion, so the salesman can use suggestion to improve the business of the customer after the sale is made. He can impress on the man who has bought, the qualities which give the article commercial value and the best ways of presenting them in selling talk, in display and in advertising, and the best way to handle sales. He can give him advice as to condition of markets, amount of stock to carry, coming fashions, and how to meet competing lines, etc. Of course, this helpfulness need not be restricted to the line the salesman handles.

THE DEPARTURE

After the solicitation has been finished the salesman should not make further demands on the customer's time. He should make his departure promptly and as tactfully as he made his approach. It may be well to express confidence that the satisfaction to be gained from the purchase will measure up fully to the anticipations aroused by the selling talk.

The salesman should thank his customer cordially, whether he has made a sale, or not. He should make it clear that he desires to be informed at any time when he can be of service, and say good day.

He should carefully avoid making the impression that his interest in the customer ended when the solicitation closed. The prompt departure should seem to come, not from a hurry to get away, but from a desire not to waste a busy man's time.

GENERAL CONSIDERATIONS

The true salesman loves the game of selling. He studies its theory and strategy. As the runner warms up to the race, so his enthusiasm increases as the competition becomes stronger. He is a good sportsman when he loses.

A growing salesman studies his successes and failures to find out why and how he made them. A man is stronger after each defeat, if he takes the pains to learn the cause of his failure and avoids that cause in the future. He is ever on the lookout for suggestions which will increase his power and skill. He finds them in the course of daily business, in swapping experiences with other salesmen, in attending conventions and in reading books and periodicals.

The salesman should acquire the habit of concentrating all his energies on what he is doing. However he should not hustle and bustle and waste his energy with unnecessary strenuosity. Over tension and anxiety are more exhausting than work. Worry and nervousness are great enemies of efficiency.

Every one should maintain a healthy interest in some avocation so that he can turn to it for rest and recreation. Some form of athletics, the theatre, some branch of study, any one of many things will do, provided he can arouse a healthy interest and

forget business while engaging in it, and return to business later on refreshed and re-energized. One should eat rationally, secure plenty of sleep and exercise and see that he is fresh and vigorous when undertaking important tasks.

The salesman's usefulness to his firm is measured by his loyalty to it. He should regard its concerns as his own. He should not carry a side line which may lead him to neglect his employer's interests. If a man cannot be loyal to the firm which employs him and become thoroughly interested in his work, he should hunt another job. It will be best for both him and the firm in the end.

The salesman should have a broad and accurate fund of general knowledge, and be interested in the recreations and business pursuits of his customers so that he can talk interestingly on other subjects than shop. Ignorance revealed in any subject a well informed man should be up on, lessens esteem and destroys confidence. General knowledge and culture add to personal attractiveness and make not only a better salesman but a more useful citizen.

The salesman should ever try to excel his past performances. He should hold before himself a yearly, monthly, weekly and even daily amount or "quota" which he endeavors to attain or excel. He should keep himself keyed up to hard work. One rarely works up to the limit of his powers. He should cultivate the buoyant, persistent, resolute spirit which will not acknowledge rebuff or defeat, as long

as there is a chance for success. When defeat comes, he should think of it only long enough to grasp its lesson, and should then devote his thoughts and energies wholly to planning and gaining future success.

SALESMANSHIP AS A PROFESSION

A study of the general conditions, factors, and processes involved in producing and marketing serviceable things is an economic rather than a psychological study. However, there are many problems in this field that can be solved only by the application of psychological knowledge.

Salesmanship plays the part of central and prime importance in the processes involved in the exchange of services or serviceable things. The function of salesmanship is to bring about a mutually advantageous exchange of services, or of serviceable things.

In order that the part which salesmanship plays in marketing services may be ranked as a profession, the salesman must attain a mastery of a fund of practical skill and special knowledge. This knowledge embraces the mastery of a body of scientifically developed and sytsematically organized general principles which must be applied in the intelligent practice of the art of selling. In order that the work of the salesman may be accorded professional standing, the special fund of knowledge and of skill in dealing with practical affairs must be employed in such a way that the exchanges of services which are brought about will be mutually and fairly advantageous to all parties concerned.

In order that the work of the salesman may be

ranked as professional, he must have an understanding of the general and special problems of marketing commodities. Although a large part of this knowledge is economic, it may be well to take a brief glance at some of the more important features of the field. It may help the salesman to bear in mind that he should know and use more than is required merely to make a sale, if his vocation is to secure recognition as a profession.

PROBLEMS OF MARKETING COMMODITIES

A large problem can not be solved until it has been analyzed into its component parts. The general aim of business is to produce and exchange commodities fitted to satisfy the needs of men. To carry out this aim the needs must be clearly discerned and their importance for well-being must be appraised.

To realize its general aim, business must solve many difficult problems involved in the production and marketing of commodities. The solution of each problem in turn becomes a general aim which must be subdivided into many problems demanding solution. Each of these problems must also be looked upon as a combination of many problems. In discussing the process of thinking we have made clear the general method which must be followed in solving problems. We state here some of the problems marketing has to solve.

The salesman should understand the part his work plays in the complex processes of business. Business includes the industrial processes of producing goods fitted to satisfy needs, also finance, accounting, law, and marketing. The salesman performs a part of the work of marketing the service rendered by the business.

The general plan of marketing, or distribution, must be worked out by employing data gathered

from a careful study of some or all of the following factors, according to the nature of the commodity.

The market must be analyzed. What are the qualities of the commodity which fit it to promote well-being? Is it demanded by all, or by certain classes? Is the consumption of it continual, occasional, or seasonal? Does it serve a permanent interest, or an interest which has the nature of a fashion, or fad, or fancy?

There must be a survey of the field in which the market must be sought, to find, among other things: the present number of the consumers of the commodity, their per capita consumption, and the prospect of increasing either this consumption, or the number of consumers; the ratio of present consumption to unit area of territory, in various parts of the field.

The production and marketing of competitors should be studied to determine: their number, their combined and individual output, the distribution of their outputs, their best and worst markets, the accessibility of their markets, the channels through which their output is distributed, whether through jobbers, or direct to dealers or consumers, by salesmen, or by mail order, their advertising methods, etc., the location of dealers and jobbers in the territory; the possibility of increasing the number, etc.

The manufacturing methods of competitors, the merits and demerits, and prices of their commodities must be considered.

Those who have the direction of the marketing

should know, the financial resources and capacity of their own plant, the cost of raw materials, of manufacturing, of overhead expenses, and of selling, the amount of business possible to be secured, and the amount likely to be gotten, the amount of business likely to be secured in various districts of the market, estimated according to the area and accessibility of the districts.

The one in charge of the marketing should know the cost of production, the lowest price which can be accepted, the best price which can probably be obtained, the amount which any possible lowering of price would increase the consumption, and affect competition. When he has determined the price which should be asked to secure a fair return for service rendered, he should be able to estimate the probable sales and profit, as a basis of determining how much should be spent for selling and advertising. These estimates should be based upon what competitors are doing, the comparative desirability of commodities, and, if the business is new, the greater cost of selling resulting from the lack of good will.

The plan for marketing must be adjusted to the various conditions of territory and competition. It must take into account the capabilities and limitations of its own industrial and financial resources. A general plan of distribution should be formulated which is adapted to all the requirements revealed by the survey and analysis of the market.

The general plan of marketing should formulate

plans for advertising and selling. The advertising and selling plans should be properly co-ordinated with each other, and adapted to cultivating the market most profitably. An efficient shipping department should be organized.

In developing material to be used in the appeal of the salesman, and of the advertisements, the commodity should be studied to determine, whether it has distinctive features of serviceability, or whether it is difficult to distinguish from other similar things. The name, the package, and the trademark should be carefully scrutinized. They should be made attractive and distinctive, and should be protected as fully as possible.

The articles of competitors should be studied to get knowledge like the foregoing in regard to them. The strong and weak points in their appeals should be noticed, and how much they have influenced consumption. The efficiency of the advertising methods should be noticed, also the value placed on various media as evidenced by their use.

The stationery should be attractive. Follow-up methods and material should be carefully worked out.

The salesman should have a sound grasp of the fundamental principles of marketing. He should master the special marketing problems of his own line, as well as the theory and practice of selling. Specialization in selling narrows the view, unless it is accompanied with progress in general knowledge.

The narrow specialist in selling can not view the significance of his work in the right perspective. He can not readily adapt himself to the changes in conditions that are certain to come. He has small chance for promotion to a position of greater responsibility. Every salesman should have a knowledge of the broader problems of marketing, as well as a knowledge of the processes of selling, and skill in practicing the salesman's art.

The salesman should be thoroughly familiar with the plan adopted for marketing his commodity. He should understand the general advertising policy, and should keep in touch with the things done in carrying out that policy. He should carefully coordinate his efforts at selling with the advertising campaign, so that the salesmanship and the advertising will be mutually helpful. He should also see that the efforts of the local dealers are properly adjusted to profit by the work of the advertising department. He should be a competent adviser in regard to their methods of display, their local advertising, etc.

He must know the previous successes of the house in his territory, how much opportunity there is for growth, and where his efforts will be likely to bring the best results.

The salesman should know the terms of sale, the credit rating of those to whom he wishes to sell, and the normal requirements of their business in his line.

The salesman should keep the firm informed in

regard to the financial standing and business success of actual and prospective customers. He should be keenly alive to the amount and character of competition, its points of strength, and of weakness. He must know the style and quality of goods desired. He is ever alert to find how his own line may be better adapted to satisfy the needs of the consumers. The salesman must improve every opportunity to gather data which will be helpful to the manufacturing and marketing departments.

The foregoing should be taken as illustrative rather than literally prescriptive. It should be adapted to the particular conditions of the commodity. The aim has been to make clear that a man must be more than a narrow specialist in the art of selling, if he is to perform efficiently the duties of a salesman.

The aim of the business should be to render normal service to the consumer. The return secured should be only a fair exchange for service rendered. The salesman should be animated by the same ideal.

The salesman should be more than a mere expert in the art of selling. But general capacity and proficiency are not enough. He must understand the general principles of the processes of selling and have skill in practicing the art.

Psychological processes are the most important factors with which the salesman has to deal. The salesman must employ his own mental processes, so that he will be most efficient in influencing the mental processes of prospective purchasers, in such a

way that they will desire and buy. To do this, he should understand the mental processes of his own and the buyer's mind.

Practice guided, not by general principles, but by haphazard trial, may give a certain skill. One may, in this way, attain to a certain degree of success without being efficient.

An exhorbitant price is paid for skill acquired by this wasteful method. The skill so acquired is not adaptable to changing conditions, except by the same wasteful process of random trial and error and the selection of lucky hits.

The salesman must not merely understand the general principles of the selling appeal and the function of its various parts. He must acquire proficiency in practicing the art of selling.

The salesman must know many things about the particular commodity he is engaged in selling. He should know something of the materials and the process of manufacturing. He can then give the buyer an idea of the materials, and labor, and machinery required to make the commodity. He should thoroughly understand the serviceability of his goods. He should know the serviceability of his line in comparison with competing lines; the points of relative advantage and disadvantage, etc.

By this time, it should have been made clear to the salesman that, in practicing his art, he is dealing with psychological processes. Attention, interest, desire, suggestion, impulse to action, and many others, have been dealt with frequently in developing

the general theory of salesmanship. An attempt will now be made, in Parts II and III, to give a clearer understanding of these processes.

PART II

PROCESSES OF THINKING, FEELING, AND ACTING

BEHAVIOUR

Behaviour is purposive activity, or activity which aims at some desired end. Behaviour is intelligent, rather than merely impulsive, when it involves comparison of means available for the attainment of an end, and the selection of the means which the comparison shows to be best fitted for the attainment. Psychology deals with the constitution and processes of the mind as factors in behaviour.

DISTINCTION BETWEEN MENTAL AND PHYSICAL PROCESSES

Think about your brain! The brain is a material object. It can be weighed in ounces and measured in cubic inches. It fills a definite amount of space in the skull. Another material object can not be put in the space occupied by the brain without injuring and displacing it. When the skull is opened, the brain may be observed by a number of people at the same time. The brain is a manifestation of certain processes, known as vital and physical, the inner nature of which is clearly beyond our power of direct observation.

Now think about the thing which thinks about the brain. This is the mind, or the processes manifested in the consciousness of the thinker. Conscious processes do not fill space or have weight. The head is no fuller and one is no heavier when he is thinking of a ton of coal than when he is not thinking at all. The mind is not in the brain as the seed is in the pumpkin.

Objects of the material world may be observed by many. As far as our observation reveals, they are not conscious of their existence or of what is happening to them. Mental processes are conscious of being mental processes. In the lowest, or least developed, forms of living things the consciousness must be extremely vague and diffused. It probably takes the form of a feebly felt striving. In man, with whose mental processes we are here concerned, the mind not only thinks, feels and wills, but also knows that it does so. In man, conscious processes are self conscious. In self consciousness the ability to observe and classify and understand the function of conscious processes has been developed.

SUBJECTIVE AND OBJECTIVE REALMS

The things, of which we have experience, but which exist independently of our experience of them, are called objects of experience. They make up what is known as the objective world. Our conscious processes which experience the external objects, together with our experience of these objects

are said to be subjective. Our thought or idea of another person, or of a house, or other material object, is subjective, but the person or the house is objective.

METHOD OF GAINING PSYCHOLOGICAL KNOWLEDGE

The study of mental processes is carried on by introspection, which means looking within one's own mind. Every normal person can observe and describe, more or less satisfactorily, what is going on in his own mind. He does so, for example, when he says he is puzzled, or was imagining, or thinking, or feeling pleased, or angry, or striving, etc. The introspection which the psychologist employs is similar to this universally practiced self observation. The psychologist merely takes more pains to make his observations clear, accurate, and complete.

Progress in the knowledge of the workings of one's own mind would be very slow, if one had to rely solely on the results of his own introspection. In psychological literature, one finds accumulated the knowledge gained by the efforts of the best observers and thinkers of countless generations of men. Psychologists have gathered the general conclusions from this wide range of observation and experience, and have arranged and classified them and tested their truthfulness by applying them to experience to see whether they would work satisfactorily in giving us guidance in dealing with experience.

Reading, alone, will not make a good psychologist,

any more than it will a good physician. A book can only serve as a guide in pointing out what to look for, where to find it, and what its significance is. If one is to acquire useful psychological knowledge, he must become interested in, and skillful in observing what goes on in his own mind.

One has not mastered the general principles developed in this book well enough to make them helpful in the practice of salesmanship, until he can illustrate them with elements of his own experience, other than those given in this book. One has not mastered a thing until he can apply it successfully. Attempt at application is an efficient method of learning. One can thus tell whether he has grasped a thing. If one can not verify in his own experience the truthfulness of the general principles explained here and provide additional illustrations of them, he has not adequately grasped them.

EXPERIMENTAL PSYCHOLOGY

Certain mental processes have been studied experimentally. By using the apparatus and following the directions of the original experimenter, the processes can be reproduced as often as desired, under conditions which free them, to some extent, from confusing and distracting factors. In this way the conclusions of the experimenter may be studied by many different observers, and modified, or corrected, or verified as holding good for all minds. Experi-

ment, when it can be applied, merely aids, rather than takes the place of introspection.

KNOWLEDGE OF THE MINDS OF OTHER

Psychology assumes that the minds of all men work according to the same laws, and that conscious processes and behaviour are similarly correlated in all persons. That is, the same conscious processes are manifested by the same forms of expression and behaviour.

Also simliar forms of expression and behaviour may be assumed to have resulted from similar conscious processes.

We can not directly observe what is going on in the mind of another. The mental processes of another can only be inferred from what he says and the expression of his countenance, and the tone and manner of saying it, and from what he does and his manner of doing it. These things that are significant expressions of the mental processes of others, can be interpreted rightly only as one, as the result of accurate introspection, has a correct knowledge of the processes in his own mind which have the forms of expression he observes in others.

Not only thoughts, but also feelings and volitions are communicable. Through understanding the interplay of processes in his own mind one gains insight into the interplay of processes in the minds of others.

In saying that we know the minds of others only

by inference, we do not mean that we must clearly discriminate the significant expressive elements in the total impression we are receiving, and center attention on them, and make explicit inferences from them. Through wide experience, carefully digested, we learn to apprehend the subtle expressions of the feelings and emotions of those with whom we deal, without being able, in many cases, to tell just how we do it. We learn to apprehend the symbols of these as readily as we learn to apprehend the thoughts expressed by verbal symbols. Our attention is not directed to the symbol in either case.

The ability to understand the feeling and motives of others is largely instinctive. One who did not have at least an innate capacity along this line that could be readily developed in experience would not get along well with his fellows.

CLASSIFICATION OF CONSCIOUS PROCESSES

Psychology aims to describe and classify the various conscious processes as they are manifested in experience, and to make clear their correlations with behaviour. As one observes his conscious processes he will distinguish in them three aspects, known as thinking, feeling, and willing.

The processes of knowing about things are studied in psychology under the headings, sensation, perception, conception, association, memory, apperception, judgment, and reasoning.

In sensation and perception we get a knowledge of our own bodies and of the external world. We may distinguish a mere sensation of warmth, cold, light, color, sound, touch, taste, smell, pressure, muscular strain or motion, without referring it to any particular object. But when we are aware of a warm object, or moving object, or colored object, we are said to have a perception of the object. We can distinguish a sensation of red, but we have a perception of a red apple. In the perception of the apple, along with the actually experienced sensation of redness, we attribute to it various qualities as roundness, smoothness, weight, taste, edibility, etc., which, our previous experience has taught us, are possessed by apples.

We form concepts or general ways of thinking and behaving in regard to objects, we pass judgment on them, and enter into extensive trains of reasoning about them.

We not only have various processes of knowing about objects; we are also affected by them. That is they arouse feelings of pleasure or pain and various emotions. A cut or bruise causes a feeling of pain. When you are cold, a fire gives a feeling of pleasure. Other experiences may give rise to the more abiding emotions of joy, sadness, pity, sympathy, hate, love, jealousy, respect, anger, fear, remorse, happiness, etc. These emotions spring from more complex intellectual processes than do the feelings. They are also tinged with pleasure or pain.

The volitional processes are attention and volition. They will be studied more fully later on.

The processes of thinking, feeling, and willing, are merely distinguishable, but not separable, aspects of the one conscious experience. Thinking, feeling, and willing are manifested, with varying degrees of prominence, in every conscious process.

MIND AND BRAIN

Mental processes are accompanied by and depend upon brain activity. Increased mental activity involves a similar increase of brain activity. The increased brain activity requires more nourishment and produces more waste matters to be eliminated. Other organs of the body such as those of digestion, the kidneys, the liver and the lungs must work harder to supply the energy and eliminate the waste. A sound mind requires the services of a sound body.

Salesmanship makes heavy demands on both the mental and physical processes. The efficiency of the salesman will vary with the general condition of his body. He should be careful to take proper food, exercise, recreation, etc. Excessive exercise or severe manual labor impairs the efficiency of mental processes. Loss of sleep prevents proper nourishment and removal of waste matters. It causes a temporary loss of weight, with a corresponding decrease in the amount of energy available for work.

HABIT

When we first undertake to perform a new act which is complicated, or requires special skill, our efforts are hesitating. Awkward and groping movements that are bungling and ill suited to the purpose are mingled with those properly directed. We note

with satisfaction the well directed movements, and endeavor to repeat them and to check the others. With practice, the movements gradually become better co-ordinated, more accurate, and easier to perform.

Painstaking effort, faithfully persisted in, develops skill. Finally, the whole complicated process is running smoothly. It runs along, almost without conscious supervision, while attention is directed to other things. Through discriminating practice and repetition, complicated acts come at last practically to repeat themselves, although they at first required careful thought and effort to perform them with indifferent success. To all intents and purposes the acts have become automatic. Acts which have thus, through practice, come to be practically automatic, are called habits. Thus we have learned to walk, to eat, to talk, to read and write, to sing, or play, or run a typewriter, or do the countless other familiar routine acts with which our lives are so largely filled.

The explanation of habit formation is largely physiological, rather than psychological. However, some hold that habit involves some psychical modification, as well as physical. The tissues of the brain are plastic. Plasticity means that the brain cells are modified by, and permanently retain, the effects of the activity which takes place in them. Nervous impulses, or currents of nerve activity, are aroused in the organs of sensation such as the eye, ear, or hand. They go through the brain, and then pass out

through another set of nerves to control muscular activity. In so doing they leave an effect on the nerve cells, or a "path" that other impulses will tend to follow. By repetition, definite channels are developed, which currents of nerve activity habitually follow.

While these channels are being developed, conscious supervision, guidance, and effort are necessary in performing the acts. When the pathway of nervous discharge has been definitely established, the impulse follows it without guidance. The switches are set for the impulses in the nervous tissue to pass along the right tracks. The physiological organism has gained the ability to perform acts which originally required conscious supervision. It performs them more quickly, and more accurately and with less fatigue.

In forming habits, the brain has been moulded by practice. It has taken on stereotyped forms by means of which many of the routine acts of life may be economically performed. The lessons of experience are thus registered in habitual ways of thinking, feeling and acting about things. Familiar acts thus come practically to perform themselves, while the attention and intellect are left free to grapple with new problems and situations which arise. We thus see the importance of rendering habitual the routine acts of our daily life.

LAW OF ACQUIRING PROFICIENCY IN A NEW LINE

The movements, or procedure, involved in forming a new habit may be learned by the method of trial and error, or by imitation of others.

When the right procedure, or combination of movements, has been apprehended, the factors which make for success in forming the habit are:

1. Concentration of attention on the task.
2. Careful rehearsal, or repetition.
3. The avoidance of lapses into another procedure until the habit has been firmly established.

With the formation of the habit there develops a propensity to do the thing in the way being made habitual. The habitual way grows to be the pleasant way. A departure from it becomes unpleasant.

One should make a strong resolve to form the new habit. He should reinforce this by holding in mind the satisfactory consequences which will result from forming the new habit and the unsatisfactory consequences which will result from failure.

When a man takes up a new line of work, his general education and experience enable him to make rapid progress at first. Improvement is rapid at first, because the steps of progress are made largely by merely using old habits, and previously acquired skill and knowledge, and reorganizing them and adapting them to a new use. When these easy steps have been made, and when farther advance depends mainly on acquiring new knowledge and developing

new habits, progress becomes slow and difficult. The enthusiasm resulting from the novelty of the work fades away. For a time one seems to make no further advance in skill. He may even become less successful in the performance. He has reached what is known as a plateau in habit formation.

When a plateau of arrested progress or develpment has been reached, the faint hearted often become discouraged and quit. However, the knowledge that their experience is a normal one should give them resolution to keep on. When a plateau is reached, further progress depends mainly on the ability to hold one's self to the task by sheer force of will, until the new knowledge is assimilated, the new habits are formed, and the new skill is developed. Finally another stage of rapid progress will be entered upon, and may continue for some time, before another plateau is reached, and another stage of arrested progress must be worked through.

Our nervous tissues are plastic in youth, but become less easily moulded as we grow older. Under twenty is the time to fix right personal habits of eating, exercise, neatness in dress, well modulated speech, ease in intercourse with others, etc. Between twenty and thirty is the age best adapted to forming intellectual and professional habits.

To develop a new habit of this sort, start with determination and vigor to do the act. Improve every opportunity to practice it. Make no exception in favor of the old habit. One brief lapse into the old

way, will sweep away much that has been gained by long and painstaking efforts, and will greatly increase the chance of future lapses occurring. Banish the old habit from your mind by keeping your thoughts fixed on the new one, and on the satisfaction to be gained from forming it. Keeping the old habit in mind develops an impulse to perform it which it requires effort to resist.

Every one should realize early in life that he must work out his own fate. Whether he is a failure or success depends largely on the habits he forms.

We easily become slaves to bad habits, or to poorly formed habits. The hell hereafter is not more to be dreaded than the hell we can make for ourselves on earth by developing wrong habits.

Habit gets one into a rut. We grow to like habitual ways of doing things. Constant self-criticism, alone, will tell one whether his ruts are carrying out of the line of progress and of greatest efficiency.

One should endeavor to discover the most efficient ways of doing the routine matters of his business and to make them habitual as soon as possible. Attention can then be centered on the important problems clamoring daily for solution.

The discussion of habit will be continued under the topic, "Developing Character and Personality."

ASSOCIATION OF PROCESSES OF THINKING, FEELING AND ACTING

The effect that the solicitation of the salesman has on the customer, depends on the processes of thinking, feeling, and acting, aroused in the customer by the suggestions and arguments used. The form which these processes will take depends upon the habits and associations previously formed by the customer.

ASSOCIATION BY CONTIGUITY

To make clear what is meant by association by contiguity, think of the word "stock " for a few moments, and then notice what thought follows it in your mind. The word stock may suggest to you the goods in a store, the paper representing a financial interest in some corporation, the raw materials from which something is to be manufactured, or a part of a gun, or a thing to wear around your neck, or the stock from which a cook makes soup.

A merchant would be most likely to think of the goods in a store, a broker of the stock certificate, a farmer of the animals, a haberdasher of the thing to wear round your neck, a cook of the soup stock. This is explained by the fact that each man has formed a habit of going in thought from the one idea to the other. When such an habitual process has

been established between thoughts they are said to be associated by contiguity.

The law we are now considering is often called the law of association of ideas by contiguity. But in using the word idea, we should bear in mind that an idea is a process of thinking about a thing. Also that an idea may become associated with a feeling. For example, if one has become ill from eating an article of food which he has previously liked, the thought of eating the article thereafter may arouse in his mind a feeling of disgust, with its volitional tendency to avoid eating it. If a customer has been offended by a salesman, or even unjustly feels angry at him, or dislikes him for any reason whatever, the customer may thereafter feel ill will for the store which the salesman represents. On the other hand, a courteous efficient salesman, who is considerate of the real interests of the customer, will inspire a feeling of good will which will become associated with the thought of the business he represents.

The thought of the store is much more likely to revive the feeling of ill will or good will associated with it, than the presence of the feeling of ill will, or good will, in consciousness is likely to revive the thought of the store. We tend to pass more readily from the processes of thinking to the processes of feeling associated with them, than vice versa.

The following statement of the law of association by contiguity includes processes of feeling and willing as well as processes of thinking. If two pro-

cesses have been in consciousness together or in immediate succession the reappearance of one of them will tend to recall the other.

ASSOCIATION BY SIMILARITY

If one disregards the spelling of the word "stock" and centers his attention wholly on its sound, it may suggest the word "stalk" having a similar pronunciation but a different meaning. This illustrates association by similarity. The law is as follows. A process of thinking tends to suggest similar processes of thinking. A process of feeling does not in the same way suggest similar processes of feeling. The process of feeling rather tends to bring it about that the process of thinking, or ideas associated with it, will suggest other ideas which have a tendency to arouse a similar process of feeling. This point will be made clearer later on, in discussing emotional congruity as a factor in association.

If you think of the moon, some idea previously thought of in connection with the moon may come into mind in accordance with the principle of contiguity. You may thus think of "green cheese," or of something you did on a moonlight night, or of something you know about the moon.

If you focus your attention on the brightness of the moon, you may next think of the sun, or of a light, or of some other bright object. If you focus your attention on the spherical shape of the moon, you may next think of a ball, or some other object of

similar form. If you focus your attention on any aspect, quality, or characteristic of an object, the object may suggest any other object which has the same aspect, quality or characteristic, no matter how unlike the two objects may be in other respects.

Any object may suggest any other object which resembles it in any respect, provided the attention is focused on the quality in which the objects resemble each other. The similarity may be commonplace and evident, or far-fetched and fanciful, as in poetry. The similarity may be one of abstract relationship and difficult to perceive. A classical example of this is Newton's perception of the similarity in relations between an apple falling to the earth and the moon drawn continuously toward the earth, so that it moves around the earth, rather than passes off into space in a straight line; as it would do, if it were not attracted to the earth as the apple is. By assuming the force which holds the moon in its orbit to be the same as the force which causes the unsupported apple to fall toward the earth, Newton was able to demonstrate that the motions of all the bodies in the universe conformed to the law of gravitation. He proved the universality of the law of gravitation. The great inventor is the person who sees the similarity of relations which makes it possible to put a familiar contrivance, or process, to a new use.

The great poets and artists, and leaders in thought, the great inventors and captains of indus-

try, in short, the geniuses in every line, have minds unusually fertile in association by similarity. Fortunate is he who can see the resemblance of things!

An idea which a salesman presents in his solicitation may arouse in the mind of his customer, through association by contiguity, any idea which the customer has habitually thought of in connection with the presented idea. But other things being equal, the presented idea is more likely to suggest an idea which has been recently or vividly thought of in connection with it. Or the idea suggested by association may be similar to the idea presented, and will probably be in harmony with the existing emotional tone of the customer.

It is probable that the word stock, when previously thought of, revived the idea most firmly connected with it by habit. Now stock may suggest a neck piece, or soup, because the latter ideas have been recently in mind, and probably vividly so, since the association caught the attention because it seemed far-fetched.

If you were in a vindictive frame of mind the word stock might suggest the "stocks," a contrivance formerly used to punish criminals. To an unsuccessful or discouraged merchant, the word stock may suggest that he has too large a stock on hand already, and that he should reduce it rather than add to it. A successful and optimistic merchant tends to think of increasing his stock, as a means of increasing his profit. The trend of association is thus

determined by the emotional state. The idea brought to mind by association will tend to be in harmony with the prevailing emotion.

His emotional state is an important factor in determining the thoughts and actions of a man. The "bull" is in an optimistic attitude of mind in regard to future prices, while the "bear" is pessimistic.

The salesman must endeavor to arouse in his customer's mind a general emotional attitude favorable to the acceptance of his proposition. He should aim to create a feeling of confidence that business will be prosperous in the immediate future. A desire for profit aroused will tend to make one buy the thing offered as a means of increasing profits. A vivid fear of loss will make it easier to sell fire insurance, or a fire-proof repository for business records.

MEMORY AND THE ART OF RECOLLECTING

The law of habit, manifested in forming associative connections among mental processes explains the ability to revive, recollect, or recall processes previously experienced.

The memory and recall of mental processes depends upon the fact that during the experiencing of the processes the structure of the brain is modified. A permanent change takes place in the structure of the cells of the brain and in the arrangement of the connections between them. The brain thus retains a trace of the mental process after it has passed out of consciousness. The activity has established a course through which the nervous excitation will tend to pass more readily in the future. A stimulus is more likely to follow a previously established course than to open a new one.

The existence of such an inactive brain path is retention. When the brain path is again stimulated to activity it gives rise to, or revives, the mental process which accompanied its formation. The process is thus remembered and recalled.

In studying memory and the art of recollecting, it is convenient to use the familiar term "ideas." However, we should bear in mind that an idea is a *process* of thinking. A process of thinking is found only as a part of a conscious process which also in-

cludes feeling and volition. The conscious process always has these three distinguishable, but not separable, aspects or factors, of thinking, feeling and willing. But, in order to get a clear understanding, it is necessary to study one aspect or factor at a time, while others are disregarded. In studying memory, our attention is thus mainly directed to the process of thinking.

When we are dealing with the conditions which account for the retention and recall of ideas, we naturally ask how can one increase his ability to retain and recall the things he wishes to know?

Ideas may be remembered and recalled as a result of associatively linking them together by mechanically repeating what we wish to recollect. Will practice in this form of memorizing increase our ability to memorize? Many experiments have shown that the retentive capacity of our brain tissue can not be noticeably increased by any effort of ours; though it will vary with our freshness, fatigue, health and age. It is possible to make great improvement in one's ability to memorize, but other methods than mere mechanical repetition are required in order to achieve the result.

The ability to retain and recall ideas can be increased only by forming improved habits of memorizing. The habits which make for efficiency in memorizing are a habit of clear and adequate observation and thinking, and a habit of discriminating and appropriate association. Both these habits in-

volve the habit of concentrating the attention.

The prime essential of correct memorizing is to see that the things one wishes to be able to recollect are clearly and correctly perceived. The fact that one wishes to remember a thing shows that it has certain qualities which make it a factor bearing favorably, or unfavorbly, on the satisfaction of some interest.

The qualities which make the thing such a factor are the essential or significant qualities. In other words, the meaning of a thing is its bearing on the satisfaction of our interests.

The thing should be linked firmly by association with the interest whose satisfaction it concerns. The most salient, or characteristic qualities, that is the ones which will serve most readily and certainly as a means of recognizing the thing, must be singled out and carefully noted. They should be associated with the less obvious or significant qualities, or meaning, to serve as cues of recall.

We must carefully observe the essential or significant qualities of the thing. That is, we must note its bearing on the satisfaction of our interests. We must also note the significant and easily recognizable characteristics, and firmly associate them with the meaning of the thing. One should also observe the most natural or important connections between the object he wishes to remember and his previously existing store of ideas. These will be ideas closely connected by previously formed association with

the interest concerned with recalling the thing. We must connect these ideas with the idea to be remembered by as many association links as will be likely to prove useful. To make the associative connections between the ideas as serviceable as possible, the attention should pass from one to the other in the order in which it will be useful to recall them.

Two orders of recall should be established. The interest should serve as a cue to recall the thing as a means of satisfying it. The thing should serve as a cue to recall or awaken the interest and suggest to it that here is a possible means for securing satisfaction. To insure this result one should notice these relations and should endeavor to establish firm associative connections in both orders of recall. The occurrence of the need should suggest the thing. When the thing is encountered, it should suggest an opportunity of satisfying the interest.

Suppose that while studying salesmanship you are looking around for an opportunity to advance at some future time your interests as a salesman. When you meet men who may be able to give you a position, or help you to get one, you should firmly associate the idea of the men with your interest in getting a position. Your interest in getting employment should suggest the idea of the man as a possible means of getting employment. A meeting with the man should suggest that here is a possible opportunity to get employment.

Let us consider a more concrete illustration. Sup-

pose you meet a man and it occurs to you that "He may at some future time be on the market for what I am selling, or can give me valuable information or assistance." When you meet the man again you will wish to recognize him as a prospective customer, and call him by name. You will also wish to recall him when you are endeavoring to think of prospective customers to visit.

As you talk to the man, you should notice the most prominent characteristics of his appearance so as to impress a clear and accurate likeness of him on your memory. If you are a poor visualizer, and do not readily recall in memory, or picture to yourself how things looked when you actually saw them, it will be helpful to make to yourself a brief verbal description of the features of his general appearance which you believe will enable you to recognize the man when you see him again. You may compare and associate these with similar features of other men you know. For example, he looks like Smith but is taller. With this picture or idea of the man you must firmly associate his name, by thinking of it while making your observations. Use his name frequently while talking to him.

After the interview has ended, you should strengthen the association links you have established by recalling them and thinking them over. With them you can associate the man who introduced you, the place and circumstances of your meeting, the conversation you had with him, his business and so-

cial position and relation to other men you know, etc. Some, or all, of these, or similar associations you should form. You should firmly link them to your interest in the man as indicated above. Some men record in a note book the things they thus wish to recall.

If you wish at any time to recall the man's name, or appearance, or some fact about him, you can do so only by thinking over the ideas associated directly, or indirectly, with what you wish to recall, until one of them, or the combined force of all of them, suggests it.

ASSOCIATION PROCESSES IN EDUCATION

Education is the development of innate capacities of thinking, feeling and acting. Educational development takes the form of capabilities and habits of thinking, feeling and acting in such ways as will best contribute to the harmonious satisfaction of the various interests. This will be explained more fully later on.

The developed tendencies of thinking, feeling, and acting must be organized into serviceable association systems, if they are to serve effectively in securing satisfaction for the various interests.

PROCESS OF LEARNING

We may define the process of learning as the organizing of knowledge and skill so that they will be useful.

The efficient life is the well ordered purposive life. The efficient education is the one which arranges, systemizes, or organizes, the materials of knowledge and skill in such a way that they will serve most effectively as means of attaining life's purposes. Interests and purposes are the criteria by which one measures the value of things. Things have meaning and are valued, only as they are perceived as being in the relation of means to ends. The aims and purposes of life determine the selection of the elements to be associated and what associations shall be established between them.

Inefficient doing of a thing comes largely from inefficient thinking out of the method of doing it, or from failure to think at all. Efficient doing consists of selecting the essential factors from the unessential, and in skillfully organizing and employing them as a means of attaining the end in view.

In order to become generally efficient, one should formulate an ideal of efficiency and endeavor to attain it in every line of activity.

The principles of efficient learning and thinking

are the principles which make for efficiency in all lines of business activity.

Efficient thinking aims at the attainment of some end or purpose. Thinking will be discussed more fully later on. It deals with the solution of problems or the surmounting of difficulties hindering the attainment of ends. One must first think into his experience, or learn, what he would use later on in thinking out his problems.

When one encounters a problem, whether it is practical or theoretical, he can solve it only on condition that it suggests to him by the help of previously formed associations, the means required for its solution. The man who is efficient in grappling with problematic situations in an original way can do so only as his previously formed associations suggest original means.

The process of learning should be so ordered that it will be most helpful in thinking out problems. The most important question in education is how to organize the materials of experience into the most serviceable connections with each other.

One who wishes to accumulate a rich fund of experience, from which he can draw helpful suggestions when they are needed, should cultivate a questioning attitude of mind toward the matters with which his business is concerned. When he comes upon significant things, he should put them in his sinking fund of knowledge, by firmly associating them with the interests for which they have signifi-

cance. He will then have a wide range of knowledge at his command, from which he can draw to meet the obligations of thinking, when they are encountered.

MEANING OR SIGNIFICANCE OF THINGS

The meaning or significance of a thing is the bearing it has on the satisfaction of our aims or interests. Meaning lies in the qualities of the thing which determine our behaviour toward it. Chair, as a general notion, is a symbol of a class of objects with which we may do certain desired things. We class as chairs all objects with which we may do these things. We pass judgment on a thing when we put it in a general class and attribute to it the qualities of the class. An apple has a different meaning or significance than a chair because it concerns the satisfaction of different interests. A bench has a meaning similar to a chair. But its meaning is different from that of a chair, to the extent that the bench has certain qualities which affect the satisfaction of our interests in a different way.

A thing thus has meaning only as it recalls, through association, the memory of previous experiences with the thing, or with a similar thing. Our previous experience with an apple has revealed to us that it has qaulities with which we are concerned in various ways. When an apple is perceived, the meaning attributed to it comes from the awakening of previously formed dispositions to think, and feel, and act in regard to it. A thing has significance

only to the extent that present consciousness of it is supplemented by previous experience with it, recalled through association.

LEARNING AIMS TO GRASP THE SIGNIFICANCE OF THINGS

The purpose in learning is to discover the qualities of objects and the relations existing among them which affect our behaviour toward them, so that we can take intelligent advantage of the information in gaining satisfaction for the demands of our nature. We wish to know how our various interests will be affected by the various changes which may occur among the things of our experience. Knowledge aims at grasping the qualities and correlations of the objects of our experience so that we can deal with them intelligently in our efforts to secure the satisfaction of our interests.

Learning is a process of adjusting one's self to a new factor of experience, by the light of present and past experience, so that the factor will be properly appraised when it is again encountered in experience, or is considered as an element of future experience; and so, also, that the factor can be recalled when the needs of future experience so require.

The process of recognizing the signficant qualities and inter-relations of the various objects of experience is a process of judgment and inference.

MOST EFFICIENT METHOD OF LEARNING

To apply the most efficient method of learning, one should first find out the general nature and significance of the thing he is undertaking to learn. He should make a preliminary survey to see what interest is concerned with it, and the way it concerns the interest.

The next step is to get an adequate understanding of what is to be learned. The endeavor should be to get a clear, definite, and complete impression of all the parts of the thing in the order or arrangement in which they are presented.

In the third stage of learning, one should aim to select the more significant features, or qualities and characteristics, and to discern their relationships. Effort should be concentrated mainly on the proper understanding and arrangement of the more significant points. Less important matters should receive less attention.

In the last stage one should see that the general meaning, purpose, or bearing, of what is being learned is clearly in mind. He should review the associations fixed upon as most important, and see that they are properly organized and correlated with each other, in view of the general purpose.

By attentive and thoughtful repetition, the meaningful associations should then be firmly associated

with each other, and with the general purpose, in the order in which it will be most advantageous to recall them. A written outline will often give valuable help to learning.

Learning should be undertaken as a process of organizing the materials of knowledge in such a way that they will be most serviceable in attaining the purposes one endeavors to realize. Associations of resemblance or contrast, or contiguity, or class and member of the class, cause and effect, etc., will have ultimate value only as they supply means for realizing the ends which our trains of thought are endeavoring to reach. Hence, we see the importance of keeping aims and purposes in mind while forming the associations.

If one is to gain the greatest profit from the reading he does, he should apply the right method of learning. He should endeavor to grasp and condense or summarize the significant points of what he reads. He should fix upon the general topics to serve as cues of recall. He should make similar summaries of the subordinate points to be recalled under each general topic. While establishing meaningful associations among minor topics, he should at the same time, keep the general topic, under which they come, in mind, and link them firmly to it by similar associations.

He should clearly perceive the relations of the general topics as parts of an organic whole, and firmly fix in memory the perceived relations.

Learning should always be a process of working over and reconstructing in terms of one's own thought processes. In this there should be a wise selection and emphasis of what is significant for the realization of one's purposes.

The reader should be able to reproduce in his own words the definitions, generalizations, deductions, and other thought connections occurring in what is read. He should be able to make a systematic recapitulation, or summary, of what has been read. Taking brief notes will often prove of great practical help in mastering what is read, so that one can reproduce, in logical continuity, its salient features when one needs to recall them in his thinking.

When one is endeavoring to learn so as to reproduce verbatim, he should endeavor in like manner to grasp and organize the features which give the thing significance. He can thus greatly lessen the effort required in memorizing and increase the practical value of what is learned.

The great disadvantage of learning by means of arbitrary mnemonic devices, such as are employed in many advertised systems of memory culture, results from the fact that one does not grasp the meaning of the material so learned. Hence, the material is not available as a means of attaining the purposes which determine the trend of our activites. Bonds of association that are not meaningful are generally of little practical value.

It is generally more advantageous to undertake to

learn as a whole than in parts. But if the amount to be learned is so large that it seems expedient to break it up into parts, each part should be attacked according to the method outlined above. The various parts should be finally joined and organized as a whole and firmly associated with each other. In order to link a following part with a preceding part, by means of a cue of recall with which it has been associated, the general bearing and cue of recall of the following part should be held in mind while the preceding part is being reviewed and firmly associated with the following part. This cue should be one from which the various points of the following part can be developed readily in the proper order.

As the last stage of learning, one should practice recall in reviewing the whole until it can be reproduced readily. Weak associations should be strengthened. The practice in recall should be carried considerably beyond a point at which the whole can first be correctly reproduced. While practicing reproduction, the speed of recall can be gradually increased. What has thus been learned should be carefully reviewed on succeeding days, until it can be reproduced correctly and without hesitation. One should improve the earliest possible opportunity to make the first recall of what he endeavors to learn.

If learning is to be carried on most effectively, the attention must be intensely concentrated on the thing to be learned. Such application is very tiring.

One should not continue his attempt at learning until the element of fatigue paralyzes his effort.

After an attempt at learning, one should let his mind rest for a few minutes before undertaking something else. During this time the associations are becoming fixed. Their formation would be interfered with if other things were actively taken up. A brief rest will prevent such interference, or retroactive inhibition, as it is called.

INTEREST AND ATTENTION

Every one knows, in a general way, what is meant by interest and attention. At times one attends closely to an event he is witnessing, or to a conversation or speech he is hearing, or to a proposition which is being presented to him. At other times his attention wanders. He accounts for his inattention by saying he is not interested in the thing. It gives or promises no pleasure. It does not concern his fortune or welfare. One is likely to be inattentive to what a person says, if his personality repels, or his approach is not tactful.

Inattention to a thing that becomes an element of consciousness results from the fact that the attention is given to some other thing which arouses more interest. Absent-mindedness is a state in which one's attention is so completely concentrated on developing one line of thought that he does not notice other things which otherwise might arouse interest.

We may get a clearer notion of the nature of interest, from which attention results, and its relation to objects, by considering concrete examples. Ordinarily one is not interested in a time table. Even if he notices it, he at once turns his attention to some other object. But if one is going to take a journey, he may become intensely interested in a time table as a means of learning the trains that will take him

to his destination most conveniently. One's interest in the time table is satisfied, and his attention to it ends, when he has gained the desired information. His aim, or purpose, has been realized and his interest has been satisfied.

Perhaps the reader has previously had no interest in psychology, but has been led to believe that he can learn something from it which will enable him to improve his efficiency as a salesman. If he finds that an understanding of psychology will enable him to solve the problems of salesmanship more satisfactorily, he will become interested in psychology.

Objects not interesting in themselves will become so by bringing them into a significant relation to that which is already interesting. Show a man that the object you wish to sell him is the best means of realizing some aim or purpose he is interested in gaining and he will become interested in the object and will desire it.

At first one may be interested in accumulating money as a means of securing satisfaction for other interests. As one labors to accumlate wealth, his interest may be transferred from the things the wealth will secure and, through association, may become attached to and centered wholly on the accumulation of money as a means of securing satisfaction, as the traditional miser is attracted to and hoards his gold.

VOLUNTARY AND SPONTANEOUS ATTENTION

It is helpful to distinguish between voluntary and spontaneous attention.

Voluntary attention is attention directed to an object by an act of will, influenced by some motive other than interest in the thing attended to. A prospective customer may give this sort of willed attention to an article because of a request made by the salesman. Perhaps the salesman has assured him that the article will be a satisfactory means to the realization of some purpose in which he is interested. For example, the salesman may claim that the article will save expense and prevent losses. If the customer finds in the article nothing to warrant the salesman's assertion, he does not become interested in it and his attention soon wanders from it.

If the selling talk and demonstration of the salesman lead the man solicited to discover in the article a promise of bringing about the saving claimed for it, he will become interested in it and his attention will remain fixed upon it for some time. To hold the attention when it is once secured, the salesman must continue to develop interesting points, and thus lead the customer to discover in the object a growing promise of making the desired saving. This spontaneous, or nonvoluntary attention, held by the developing interest in the object, is what the salesman must secure, if he is to be successful.

Expectation of securing satisfaction arouses vol-

untary attention. Progressive satisfaction of the expectation leads to spontaneous attention.

That is attended to which seems to concern the satisfaction of the aims, purposes, interests, or instincts which at the time are more or less clearly in consciousness. Passive attention of an instinctive sort is given to intense, moving, pleasant, and unpleasant stimuli, to those which arouse curiosity and those which have a rhythmic character, etc. The various instincts and interests and their part in influencing conduct will be discussed later.

We give spontaneous attention to a thing we are conscious of being immediately concerned with. Such a thing takes on the aspect of being interesting in and of itself. It requires no effort to attend to such things.

Voluntary attention is given to a thing which is not in itself immediately interesting, but on the ground that it may concern, or is believed to concern, the future satisfaction of some interest. Such attention is very fatiguing. The ability to give attention of this sort, which is sustained for any considerable length of time, can be developed only by a rigorous course of training.

The power of giving sustained voluntary attention is the ability which enables one to direct his efforts persistently and unswervingly toward the attainment of some aim or ideal. The end to be gained is the motive which gives the trend to conscious activities.

Things thus attended to through voluntary attention tend to become immediately interesting. The interest is transferred to them through association. Henceforth they may arouse spontaneous attention.

Tasks which were at first uninteresting or positively disagreeable, may thus become interesting. The business man will finally come to turn with pleasure to tasks which originally aroused a feeling of repugnance. A knowledge of this fact may do much to encourage one to put forth the initial efforts required to perform certain unpleasant tasks connected with new work he is undertaking.

The idea of taking up a new task arouses a feeling of repugnance. The first efforts are put forth with reluctance. Persistence in the efforts tends gradually to overcome the antagonism felt for the task. The work done grows accordingly in efficiency. One should accustom himself to taking up new tasks that seem uninteresting with the consciousness that the worst will come first, and will soon be over. It is like a cold plunge. The first contact with the water is painful, but the final result is stimulating.

There is a rhythmic rise and fall in the effectiveness of attentive effort. As the power of attention wanes, the task may come to seem irksome. There is a tendency to yield to distracting influences. Under such circumstances, if one can hold himself resolutely to the task, he will find his efficiency again increasing with the rising wave of attention.

In order to accomplish things worth while, one

must be able to put forth a persistent effort to attain a remote end. He must have the ability to resist the distracting influences which tend to lure him aside. Such ability can come only through the formation of habit, as was previously explained.

FOCUS AND MARGIN OF ATTENTION

The focus of attention is the spot light on the stage of consciousness. When an idea is in the clear central light of consciousness it is said to be in the focus. Surrounding this center of clear perception are ideas of which we are but dimly and vaguely aware, if we are at all aware, that they are in consciousness. These are known as marginal ideas.

The reader can make clear to himself the distinction between the focus and margin, by practicing introspection. He will find that, as he reads, the focus is filled with what he is reading. There are, no doubt, ideas in the margin of his consciousness at the same time, which he can become conscious of, if he pauses to notice them. He may find among these ideas the ticking of a clock, the sound of people walking or talking in the house, the noises of the street, etc.

Ideas not attended to do not get into the clear center of consciousness, but remain obscurely in the margin, and soon drop out of mind.

The mind is focused on the idea to which it attends. Such an idea becomes clearer and remains longer in consciousness. Close attention to an idea makes it more likely to be remembered. By attending to an idea we bring it about that the ideas associated with it will come next into mind.

One can not give concentrated and effective attention to more than one thing at a time. However, one can get along fairly well in doing some task which he has made habitual or familiar through practice, and which as a result requires but little attentive effort, while, at the same time, his attention is focused on some unfamiliar, or difficult task which requires delicate adjustments to meet new conditions.

One can attend to an end to be gained and at the same time compare, criticise, choose, or use, means fitted to gain the end. But in any case when one attempts to attend to things which are not parts of one general process, or are not closely related to each other, the attention will alternate between them. Neither can get the effective attention which either alone would receive. Divided or distracted attention results in weak feeling, feeble impulses to action, and indecisive action.

EXPECTANT ATTENTION

Some of a magician's success comes from baffling the eye of the spectator. A greater part of it comes from diverting the attention from significant or essential things, and centering it, by suggestion, on features which do not reveal the true explanation.

The magician also creates a state of expectant attention. By carefully planned and skillfully employed suggestions, he works the spectator up into a sympathetic state of mind. He leads the onlooker

to expect vividly that the result he proposes to attain will be secured by the means, or process, he pretends to use. Criticism has been forestalled by predisposing to belief that the result will come in the way and form specified by the wonder worker. This belief fills the mind of the onlooker so fully that he sees what he strongly believes he will see.

A preconception of the intellectual sort will warp observation and judgment. A practiced reader does not readily see misprints. He overlooks them easily, even when looking for them. One standing on a crowded street looking for a friend to come along, may believe he sees him many times before he really appears. He may mistake for his familiar friend, men who are very unlike him.

Expectant attention often leads one to misjudge the real qualities of objects presented for his consideration. One sees what he expects to see. If one approaches a proposition in a skeptical frame of mind, he finds things which arouse suspicion and exaggerates their importance. If one is confident that everything will turn out all right, he is less critical. We prejudge the article favorably. Our mind is colored by the satisfaction we expect to receive. In this state of mind we are likely to overlook weak points, and see only the good ones. Good will as a business asset is largely a predisposition to look for satisfaction.

A strong desire, mingling with a strong feeling of confidence, often leads one to act without giving due

consideration to factors indicating the wisdom of another line of action. The fraudulent advertisement, or selling proposition, creates and takes advantage of such an uncritical state of mind. Attention is centered on some strong claim, or alluring promise. Desire is aroused. The mind is filled with a foretaste of the satisfaction which will result, if the attractive promise is made good. The person is made to believe that he is in danger of losing the golden opportunity, if he does not act at once. In such a state of mind, the weak features of the proposition do not receive proper consideration.

ATTENTION DETERMINES THE DIRECTION OF THINKING, FEELING, AND ACTING

Attention is the controlling factor in consciousness. The line followed by attention determines the course of thought and action. Several ideas may be in the margin of consciousness at the same time. They may be presented through the senses or revived by association. Only the one among these ideas to which attention is directed will get into the clear center of consciousness. The ideas which do not receive attention soon drop out of mind. The idea on which attention is directed remains longer in consciousness than it otherwise would. It becomes more clearly perceived, and becomes the dominant factor in determining the trend of association. Various ideas, associated with the one the attention is thus focused upon, may come more or less clearly

into consciousness, but the one of these which the attention selects will in turn become dominant in the train of thought.

In selecting the ideas which will come into mind, the attention controls the feelings which pervade consciousness, and the choices it makes, or the acts of will it performs. In more technical language, the attention, in exercising its selective function, controls the direction of thinking, feeling, and volitional acting.

The above applies to conscious processes in which association alone is depended upon to supply the ideas which come into mind. The conditions are modified somewhat when the salesman is presenting arguments and making suggestions to action. The arguments and suggestions displace ideas which would naturally come through association alone. But the arguments and suggestions have influence in controlling conscious processes and behaviour, only as they are selected by the attention.

ACTS OF WILL, OR IDEO-MOTOR ACTIVITY

One performs, as a matter of course, any act upon the doing of which he focuses his attention, unless he is prevented from doing it by some idea opposed to doing it, which is at the same time present in consciousness. Such a preventing idea is known in psychology as an inhibiting idea, and the prevention is known as inhibition.

The reader can readily find illustration of the motor tendency of ideas. Let him recall a recent trip to a store. Suppose he vividly imagines himself going to a store to make a purchase. If he tries to picture to himself in detail the actions involved, he feels himself actually beginning to perform the motions required to open the door, examine the article, etc. He will feel tendencies to activity in his vocal organs as he imagines himself speaking to the clerk.

The idea of performing an action tends to work itself out into action, that is, it is also an impulse to action. The ideas of purchasing which a salesman puts into a customer's mind are impulses to make the purchase.

Let us consider an example of an impulsive act which is fully performed. If one sees a child about to walk in front of a rapidly approaching car, he will reach out to pull him back. The act will be performed impulsively without stopping to think about

it. The thing seen arouses a strong feeling and suggests an act felt to be demanded by the situation. The impulse to perform the act fills consciousness so that all ideas of acting otherwise are excluded. In such a case the act is performed without other act of will, or volitional fiat.

The following illustrates how an inhibiting idea prevents an impulse from passing over into action. If one saw a child fall into deep water, he would feel a strong impulse to jump in to rescue him. If he could not swim, the situation would suggest to him the uselessness of carrying out the impulse. The idea of the uselessness of the act would doubtless prevent him from performing it. Such a preventing idea is technically known as an inhibiting idea. An objection which prevents a customer from closing is such an inhibiting idea.

ACTS OF WILL INVOLVING DELIBERATION

When two or more different lines of action are open to us, we may find it difficult to choose between them. Suppose it is a question whether I shall accept employment with another firm, or remain with the one for which I am now working. Each position has certain advantages and disadvantages. To bring these clearly into view, I endeavor to estimate fully the consequences which will follow upon each line of choice. Among them would be the prospects for permanent employment, increase of earnings, promotion, etc. The advantages of accepting the new position are compared with the advantages of

the present employment. Finally, I come to the conclusion that one position offers, on the whole, more desirable prospects than the other. I turn my attention from the less attractive alternative and fix it on the more desirable one. In so doing the decision, or act of choice, is made. I accept the position which I have come to regard as the better.

Deliberation between alternatives is necessary for deliberate action. But carried too far, it paralyzes effort. The active, energetic, practically successful type of man is one who makes sure that all the essential facts bearing on the situation have been given due consideration. He then cuts loose from all but one line of action accepted as the most desirable. He concentrates all his energies on carrying out the chosen course.

THINKING

The line of development which mental processes follow is determined by a more or less explicit aim, or purpose, which the person desires and strives to realize. Thinking takes place when one becomes conscious of a not immediately realizable end he desires to attain. The thinking takes the form of casting about for ways and means of attaining the desired end.

When one encounters an obstacle to the attainment of a purpose, a state of stress or effort is aroused in his mind. The anticipated attainment of the desired end arouses a feeling of satisfaction and striving toward the end. The less satisfactory present state, contrasting with the desired one, arouses a feeling of aversion, or striving away from it. In a consciousness of obstructed attainment of purpose, a state of mingling desire and aversion is thus found. A feeling of hostility to the obstacle is also experienced. This stimulates the effort to get around the obstacle, or overcome it, or even to destroy it. One has reached a thought crisis which demands clear and effective thinking, rather than blind yielding to any one of the various impulsive feeling aspects of desire, as the state as a whole is generally called.

Any activity is said to be interesting, or to arouse a feeling of satisfaction, when it awakens within us

the feeling that we are accomplishing something worth while; whether the "something" is very clearly defined or not. A feeling of interest is aroused by the consciousness of making progress toward the attainment of a desired end. The feeling of interest is a warming up to the activity, and at the same time a propensity to continue the activity which promises to satisfy the interest. The feelings of aversion and hostility lose in strength as the feeling that one is "getting warm" and the foretaste of the anticipated satisfaction grow stronger.

The desired end may be near or remote in the order of events. When the end is remote, it may be necessary, in order to attain it, to formulate many nearer ends which are subsidiary to it. The remote end then serves as a guide, or norm, in formulating the nearer ends, and in correlating and co-ordinating the efforts to attain them.

The efficient worker devotes his efforts continuously and persistently to the things and aims which he believes will play an important part in the attainment of his larger purposes. Efficiency requires that the non-essentials be eliminated. It demands that our aims or purposes be appraised according to the contribution to well-being that may be secured by attaining them. The efficient person cultivates a knowledge of, and desire for, the things worth while. He works to attain the things which give the richer and more enduring forms of satisfaction.*

*See discussion of "Well-Being or Self-Realization."

Thinking always has a purpose or end in view. This purpose is to secure satisfaction for an instinct or interest. The origin and nature of the various interests, and the different lines of activity in which they seek satisfaction will be discussed later. The end which is held in view in thinking is felt to be desired. The end which it is desired to attain through the thinking processes is to bring about such an ordering of conscious experiences as will best satisfy the awakened interest or felt need.

Thinking occurs only when one becomes aware of an obstruction or hindrance to securing the satisfaction of the interest or need. There is the consciousness that one faces a problematic situation which must be solved before a desired end can be gained.

The problematic situation may consist essentially of the awareness that the end is not clearly enough comprehended and formulated and correlated with other ends to permit one to work definitely and efficiently toward its attainment. For example the problems of promoting welfare work among employees are largely of this character. Efforts along this line are often largely ineffective, because the one putting them forth does not clearly and adequately apprehend what definite ends must be attained in order that the welfare may be promoted satisfactorily. The ideal in doing welfare work should be to promote the harmonious satisfaction of the various interests of the employee involved in a fully developed personality. Success in the work

will involve seeing to it that the employee has such incentive, wisdom, means, and opportunity as will enable him to secure such satisfaction.

If the purpose of the thinking is to overcome the difficulties in the way of accomplishing a definite mechanical result, or of performing some act such as selling an article, the problem may consist in selecting appropriate means and in employing them skillfully in the attainment of the clearly formulated purpose.

The first step in effective thinking and acting is to formulate and find answers to definite and pertinent questions. What is the end, or purpose, or aim, or goal, I wish to reach? What is the character of the obstacles that have obstructed the flow of my activities? Will this, that, or the other suggested answer be of assistance in solving the perplexity?

When one has clearly perceived his problem, the next step is to make a careful analytic search for the elements which have a significant bearing on the solution. The criterion for the selection and rejection of materials available, is their fitness for use as a means for attaining the desired end. The features of the materials which make them fit for this use are the qualities which give them significance for the end in view. The next step is the selection and arrangement of the significant features in such a way that they will contribute to the realizing of the end in view.

In the process of thinking, the interest or purpose dominant in consciousness at the time, through the

form of activity known as attention or volition, exercises a selective control over the stream of thought. The interest exercises this selective control by determining on which of the various ideas coming into the margin of consciousness the spotlight of attention shall be focused. When this control is being effectively exercised, only such ideas are received into the clear center of attention as are believed to be relevant in some way to the end which the thinking is endeavoring to gain. It becomes interesting for this reason.

The interesting idea which is received into the focus of consciousness is more vividly perceived and remains longer in mind than the marginal ideas which are merely accorded a passing glance. The interesting aspect thus held in the clear center of consciousness becomes dominant in determining the ideas which will next come into mind through association.

As the ideas recalled through association appear above the threshold of consciousness they are noticed. If they appear to have no bearing on the business of the moment, they are given no further recognition. They remain withering in the dim margin for a brief moment, as they drop out of the mind.

If the idea occurring seems to have a bearing on the desired solution, the attention is fixed upon it. It is critically examined and fitted into its proper place in the thought system which is being con-

structed. If the solution is not readily reached, an attempt is made to hold all apparently relevant ideas in the background of consciousness. In this way there is built up a fringe, or constellation, of ideas mutually helpful in suggestive force, in the hope that one, or all of them, will finally suggest the solution the judgment approves.

When an interest or purpose thus controls the processes of thinking, it lapses into the background of consciousness. The attention is directed to the ideas that appear in the foreground, discriminating, measuring, and accepting or rejecting them. But the purpose must not be allowed to lapse entirely out of mind or thought will be deflected from its guidance.

The purpose of controlling the development of conscious processes, remains in the background, but its influence pervades and gives coherence to the flow of thoughts, feelings, and strivings. Figuratively speaking, it is the commanding officer viewing, and appraising, and ordering the whole field of conscious activities. Though it occupies a position on the field of action it is aloof from the various activities and vicissitudes of the actual contestants. The associative and logical thought processes are employed merely to serve the purposive processes of feeling and striving, just as the soldiers and the equipment of the army are used as a means of accomplishing the aim of the general.

In active thinking, as has been said, one has a

definite aim, or purpose, or problem in mind. He is searching for a means of gaining the end or solving the problem. Success in overcoming the difficulty encountered depends absolutely on the ideas which come to the mind through association. Success will depend upon the care and skill previously exercised in organizing knowledge into association systems.

Efficient thinking and doing must be founded on and spring from efficient learning. The process of learning efficiently was previously explained. Such learning consists in organizing the materials of knowledge into such forms of associative systems as will contribute most satisfactorily to the use of the materials in gaining satisfaction for the interests concerned with them. In such learning, the interest to be served by the organization must be kept alive in the margin of consciousness and must be firmly associated with the organized elements with which it is concerned, by concentrating attentive effort on firmly establishing the association.

The truly efficient man is the one who can see problems where others are unaware of them. He has cultivated a questioning and critical attitude of mind toward the affairs with which his activites are concerned. He is able to bring a well organized intelligence to the solution of the problems he thus discovers. Such a man has real initiative and brings about improvement and progress. Efficiency in business involves first, the adequate formulation of the ends to be striven for. One must then locate

the obstacles in the way of attaining the ends. He must clearly perceive, and select, and skillfully employ the best means available for overcoming the difficulties and gaining the end.

In order to think and act adequately about a situation or proposition, he must have developed keen powers of discernment which enable him to select focus of attention. Right thinking and acting require that elements not relevant be disregarded, and that relevant matters be kept in mind until the means or way to the end is found. If one has previously fitted himself to handle the situation and keeps his attention concentrated on significant qualities or points, he will find coming into mind, through association, ideas which will guide him to a wise course of action.

One can have fertility and resourcefulness in thinking, only as he has previously established an extensive system of associations organized in accordance with their significant features. Fortunate is he who can see the significance of things, and can recall them when their significance will make them useful! The thinking of one whose knowledge is so organized will be significant rather than superficial. He will not be led off into inconsiderate action by the first plausible suggestion which occurs to him. He will be freely supplied with suggestions along alternative lines, which will lead him to carefully examine and appraise the superficially plausible suggestion.

When the suggestions do not come through the

associations previously established, one should undertake a systematic search for them. This search may take the form of carefully planned experiments or investigations of some sort. Or one may seek help in the experience of others through conversation or reading.

The solution of the problematic situation may thus demand that one acquire new learning. To avoid the uncertainty and tremendous loss involved in learning mainly by the method of blind trial and error, one should give an intelligent and searching investigation to the factors which may have significance for the solution of the problem. The number of failures in thinking and acting can thus be greatly reduced, but not entirely eliminated. The wider and more intelligently organized the past experience has been, the more effectively can be brought to bear on finding a way to overcome the difficulties of a novel situation.

TEST OF TRUTH

The more clearly one has centered his attention on methods of procedure, and has discriminated them from their context, and associated them with the general conditions under which they can be applied, the more effectively he will be able to bring the previously learned methods to bear in dealing with a novel situation.

Novel problems must be solved in terms of previous experiences, by combining or using the elements of such experience in new ways. One must search either his own experience or the experience of others for factors bearing on the solution of his problem. It is a difficult task to select the few significant factors in the problematic situation from the the significant aspects and hold them clearly in the many irrelevant features which are manifested along with them. When these are found it is still more difficult to form the right hypothesis, or theory, of dealing with them, than it is to determine whether we are on the right track to the solution, after the hypothesis has been formed. The only method of procedure is to critically examine the various possible solutions suggested. The most promising of these solutions should be selected as an hypothesis. By study and trial, or experimentation, one must endeavor to ascertain whether the tentatively accepted

hypothesis offers the best way out of the difficulty. The test as to whether the true solution has been reached is whether it will guide us satisfactorily in dealing with the elements of experience so that we can attain our purpose. If we find that it works satisfactorily we accept it. If not, we reject it.

Whether a suggested solution, or tentative hypothesis, is correct can be determined only by testing it in subsequent experience. However, one can often arrive at a high degree of probability by carefully thinking out the consequences that can be foreseen as likely to follow such an attempt at verification in experience. In imagination, one can anticipate the results of experience. If the situation does not involve too novel elements, he can reach a reasonable certainty that his forecast of consequences is essentially correct. This is the process of verification; whether we are searching for general notions which will enable us to deal with presented materials, or whether we are searching for a particular means of attaining a general end. One by imaginatively testing his solutions in experience can form a conclusion that they are probably true. He should not make the mistake of regarding them as certainly true, until they have been actually tried out in experience.

JUDGMENT AND REASONING.

When one discriminates the various thought relations among the elements of experience he is said to pass judgment upon them. So also when a choice is made and a decision is reached after deliberating over the consequences of following different lines of action, the act is known as a judgment.

The function of judgment, as an element in the process of thinking, or reasoning, is to notice the significant relations existing among the objects of thought. Among the significant relations are resemblances and differences, the relation, of means to end, individual to class, cause and effect, the estimation of merit or value, and the discrimination of various other relations between ideas.

One passes judgment on a thing when he decides that it's value is equal to or greater than that of some other thing, or when he decides that he can use it to bring about an effect he desires to produce, or concludes that a certain effect has resulted from a cause of such and such a character, etc.

The salesman's task is largely to induce the man he solicits to pass judgment that the article offered is the best available means of securing some end which he desires to attain. He will then desire the thing as a means of attaining the desired end. In bringing this about the salesman has produced a

state of conviction or belief in the customer's mind.

Reasoning involves a series, or chain, of judgments. There are two forms of reasoning, known as induction and deduction. One is reasoning inductively when he derives general principles or conclusions from observed facts. If the salesman can show that this, that, and the other business man belonging to a certain class has found it profitable to use in his business the article offered for sale, he arrives inductively to the general principle, or conception, that the article will be found profitable by all men of that class.

The salesman can apply deductively the general principle thus established inductively. He does so if he convinces the men he is soliciting that the circumstances, conditions, and methods of his business will rightly bring him under the general class of profitable users. If the customer is convinced of this, he will conclude that what has proved profitable to others similarly situated will also be profitable to him. His belief is founded on his acceptance of the truthfulness and validity of the evidence on which the general principle of profitableness was established, and the conviction that the circumstances in which he finds himself, will rightly put him in the class of profitable users.

It may be well for a salesman to understand the method of procedure in deductive and inductive thinking, but he will hardly find it profitable to apply them in the formal way above illustrated. However,

the salesman should understand that what is known as creating desire is generally merely showing that the object is an important member of a class of objects habitually regarded as desirable.

Our satisfied customers are our best advertisement, is a statement which aims by suggestion to cause the hearer, or reader, to make the inference and draw the same conclusion, which was reached above by following formal logical processes more closely. Such a suggestive statement is usually more effective than cold logic in influencing to action.

Such a suggestion may be backed up by a few reasons why. Even when such is the case, the one who is influenced by it is not moved by formal logical processes to make a fully reasoned choice. He is rather moved by suggestion to perform an act of rational imitation. This subject is developed more fully in discussing suggestion and imitation in the "Psychology for Business Efficiency" and the "Psychology of Advertising."

It must be remembered that thoughts originate, or grow, only from one's own experience, past and present. One is skillful in judging, as his past experience has been rich and varied, and skillfully organized and assimilated. One, so prepared, can readily select the right idea and apply it accurately in solving the problems at hand.

The genius is one who clearly perceives the significant aspects and relations of things and links them together, and to the related parts of his experience,

by helpful associations. The expert has reflected on experience, has studied and classified actual and hypothetical cases, and has formed useful association systems. He thus has many fully formed conclusions and principles of action stored away in his memory. As soon as the essential facts of a new proposition are clearly established, he at once recognizes it as belonging to a class with which he is already familiar. Without apparent consideration, or deliberation, the expert, thus prepared, can immediately and confidently give a decision on matters of the utmost importance. He has previously gone through the processes of investigation and deliberation. He sees his way clearly at once, and is ready to act confidently in accordance with his judgment. A selling appeal addressed to an expert should take a different form from one addressed to an inexperienced buyer.

BELIEF AND ACTION

Deliberation results normally in conviction, belief, and action. If I am convinced, or believe, that it will rain, I shall carry an umbrella; unless, taking everything into consideration, I am convinced, or believe that getting wet will involve less inconvenience than carrying the umbrella. In either case the belief determines the action.

I am always ready to act along the line which I believe will contribute most to the realization of the purpose which at the time seems to me most im-

portant. Because it seems most important, my attention is fixed upon it, or rather it holds my attention.

Deliberation and reasoning aim to eliminate rivalry and conflict among impulses to action. Deliberation is brought to a close when order and harmony are established among the impulses to action. When a decision has thus been reached, one refuses to attend to suggestions arousing impulses to act along an opposing line.

In attending to the acts appropriate to the conviction or belief established, he sets the switches for their performance. At last, when all preparations are made, and the judgment declares that the time and circumstances are ripe for the believed in action, and that the line is open, then the act is performed as a matter of course.

PART III

FACTORS WHICH DETERMINE THINKING, FEELING, AND ACTING

INSTINCTS OR PREDISPOSITIONS

Some parts of the following discussion of interests may seem very difficult to one who has not studied psychology. The relative importance of the subject is fully as great as its difficulty. This fact should stimulate the reader to put forth the effort necessary to grasp it. It goes to the core of the motives which influence action. The mastery of this part of the subject should helpfully illuminate the work of the salesman. It is of fundamental significance in the widely prevalent effort to rightly motivate education, vocation, and other activities of life.

"The Classification of Interests", and most that follows it, will be easier. The application of psychological principles in the practice of salesmanship will become clearer if one has a thorough understanding of the interests and the part they play in determining the actions of men. The significance of the harder parts of the book will be better understood on a second reading. If the psychology of salesmanship were easy, many books would have been written on the subject long before this.

Men are moved to action by impulses which have their roots in instincts. These instincts originated in very remote evolutionary processes because of their usefulness in promoting the welfare of the individual, or of the community to which he belonged, and in perpetuating the race. The social reformer, the politician, the teacher, the preacher, the advocate, or the salesman can influence men only by appealing to emotions, sentiments or interests developed from these instincts.

The salesman who attempts to awaken interest and desire will be greatly assisted by understanding the origin, nature and significance of these mental processes and the part they play in influencing the actions of men. One who has this knowledge will be better able to arouse interest and desire for his proposition and to take advantage of their impelling force.

An eminent authority has defined an instinct as an inherited, or innate, mental and physical predisposition to experience an impulse to attend to certain things, to feel desire or aversion for them, and to act in a predetermined way in regard to them. An instinct is complicated, purposive behaviour which has not been acquired or learned through educational processes.

From the physiological point of view a predisposition is a complex constellation of nervous paths. These paths may be fully pre-formed or partially pre-formed. That is, they may exist in a fully de-

veloped form previous to experience, or they may be only partially pre-developed and hence require experience to perfect them.

On the psychological side a predisposition is a capacity and tendency to feel interest in and strive for. Physical predispositions may be fully pre-developed or partially pre-developed.

On the psychical side the predispositions have various qualities, attributes, or characteristics which distinguish the various processes of being interested. In their developed form they take on the differentiations which are distinguished in and predicated of the conscious processes. The qualities or characteristics observed in objects awaken certain correlated mental processes of feeling, interest, and striving which have distinguishable qualities or characteristics.

When one becomes aware of the object which is the stimulus to which a certain form of instinctive behaviour is the appropriate response, he feels a strong impulse and desire to perform the instinctive act. When one first performs the instinctive act he is probably not aware of the purpose which his behaviour serves to attain. Even if he has a certain sort of vague, innate fore-knowledge of the general end to be gained, it is evident that the awareness of the purpose does not determine the form of the behaviour. There is no deliberate effort to determine what to do, or why to do it, or what is the best form of behaviour under the circumstances. When such

factors enter into the performance, the act is not a perfectly developed instinct. It results rather from more or less definite instinctive tendencies and capabilities.

The instinctive endowment of man consists largely of general tendencies and capabilities. Even such perfectly developed instincts as he has, cease to be blind as one grows in experience. With the growth of experience, the real purpose of the instinctive act comes into view and determines the choice of means to attain it. The original instinctive behaviour, or reaction to stimulus, is greatly modified. Such modification is often necessary to adapt the act properly to the circumstances in which the individual finds himself. This is true largely because the conditions of human life have changed greatly from those of the remote evolutionary period in which the instinct originated.

Authorities vary greatly in the number of instincts they enumerate. As was said before, some of the innate tendencies and capabilities of human beings are not manifested in the form of perfectly developed instincts. They require development through education and experience. However, most authorities will agree in the broad view that man, as the result of the inherited structure and tendencies to development in his psychical and physical organism, is predisposed to do a much larger number of things than are the lower animals.

ENUMERATION OF INSTINCTS

Taking the broad view, the following are among the more important instinctive capabilities or tendencies:

Appetite for certain foods and disgust for others, anger, hate, affection, rivalry, emulation, jealousy, shyness, fear, teasing, self-assertion, modesty, sexual love, parenthood, desire for approbation, sympathy, imitation, play and recreation, fighting, nomadism, agriculture (making things grow), hunting, constructiveness, secretiveness, inquisitiveness (curiosity (or desire to know), acquisitiveness, the predatory instinct, artistic interest, respect for others, gregariousness, co-operation with others, loyalty to group interest, subordination to superiors, morality, and religion, or self-subjection to the Divine Will.

The following are brief illustrations of the sort of behaviour to which some of these instincts lead. The setting hen feels that she simply must set, even if the nest is empty. Whether a brood of chickens will result from her setting evidently does not influence her act. The instincts in a human being can not long remain as "blind" as this. However, the boy may unquestionably follow an impulse to collect articles of no real value. So one sex is attracted to the other, and so the man may feel an overwhelming impulse to go fishing, or hunting.

The innate predispositions play an important part in ordering the affairs of life. One instinctively fears whatever threatens to prevent the attainment of a desire.

The consciousness of being alone in the dark or in a vast wilderness may arouse an instinctive fear, which is none the less genuine, though one recognizes that there is nothing to harm him. We hate a person who maliciously hinders the attainment of our purpose. Emulation impels an individual to rival the achievements of a superior. Rivalry, developed to excess, grows into envy, jealousy, anger, and hate. We are jealous of persons whom we regard as our rivals. We envy them their success. Acquisitiveness leads to competition and rivalry. It leads to envy, when the thing desired belongs to another. One is envious of a person when he covets his goods, and may become jealous of him as a successful rival for the goods.

Secretiveness impels one to conceal his business from others. Its instinctive character is shown by the fact that it often influences one when there is no real reason for concealment. Curiosity, or inquisitiveness, is interest in knowing. In business, curiosity, or interest in knowing about a thing, should be clearly distinguished from acquisitiveness, or interest in securing it. Curiosity may be made to lead to acquisitiveness, if proper advantage is taken of it. Combativeness may be dangerously strengthened by an extreme militaristic policy, or dangerously weakened by a peace at any price attitude.

Sympathy is the general instinctive tendency to experience an emotion perceived to be manifested in others. One responds as instinctively to the observed expression of an emotion, as he does to the object which is fitted to arouse the emotion, and for similar reasons. The instinctive imitation of the expression of the emotional state makes one aware of the nature of the state, by arousing a corresponding emotion in him. This emotion aroused through imitation is accompanied by an impulse to carry it out into appropriate behaviour. The person who experiences and responds to an emotion through instinctive imitation may be totally unaware of the stimulus which aroused the instinctive response in the person imitated. This has been a source of advantage as when the instinctive response has, for example, enabled one to escape a danger of which he was unaware. It may also lead to destructive panics and other detrimental acts. Through this instinct the enthusiasm and confidence of the salesman arouse similar feelings in his customer.

One instinctively reacts to the expression of an emotion which he has inspired in another. The suggestive force of one's own expression is reflected back to him and adds strength to his already strong feeling. As each one of a crowd is thus influencing and in turn being influenced by others, the emotions may be worked up to a very intense form. The sympathetic, reciprocating, cumulative spread of an emotion through imitation accounts for the fact that the

emotion a person experiences when witnessing a play as one of a large crowd is much greater than he would experience as the only spectator. The expression of pleasure or displeasure by the various members of an audience tend mutually to heighten each other. More will be said on this subject later.

Instincts do not appear until the necessary nervous connections have developed through bodily growth. No two children manifest exactly similar instincts. They vary in number, in relative strength, and in time and order of manifestation. All the instincts will appear sooner or later in a normal person, if a suitable stimulus is experienced when the nervous system has reached a proper stage of development.

In a general way, the human instincts have tended to adjust the individual to the necessary conditions of his existence. They enable him, independently of education, to make his environment contribute in some measure to the satisfaction of his needs.

In man the instinctive preadjustment has never attained to the perfection which it has reached in the lower animals. In the animals the instincts are ready made capabilities to perform certain acts. They are, compartively speaking, modified or improved but little by education. In man the instincts are largely tendencies and capacities which must be developed into capabilities and habits through education.

INSTINCTS REQUIRE EDUCATIONAL DIRECTION

It is not safe for the individual to follow blindly the guidance of his native impulses. Pugnacity may be taken as an illustration. The fighting spirit, as developed in some militaristic circles, is harmful to the interests of society as a whole. Yet there is no doubt that a refined and tempered form of the fighting spirit is essential to the attainment of great achievements.

An instinct may develop into a good or bad habit, or die out from lack of exercise. It may be so strong as to lead readily to over development. Or it may be weak and require strong stimulation and much exercise.

As a result of stimulation and exercise the instincts are correlated and developed into habits. In their developed forms they manifest themselves as interests and temperamental traits of character.

An instinctive tendency may fail to develop into an element of character, because of the lack of an appropriate stimulus, or of an opportunity to perform the act: or the failure to develop may result from the fact that one yields so fully to some one instinct that he neglects to exercise others. Or the instinct may be forcibly repressed. While a merely neglected instinct may die out, one that is forcibly

repressed may merely become dormant and manifest itself in some foolish or perverted act later in life.

It is the business of the educational agencies, among which the parents occupy a very important position, to see that proper stimuli and opportunities for exercise are furnished to each instinct when it ripens. In this way the instinct may be developed into an interest or trait of character useful to the individual.

The instincts are often in rivalry with each other. The educator must see that they are properly harmonized. He must also see that the person is furnished with knowledge and incentive to guide his development along the lines of his real needs.

The mental constitution of an individual has taken its form through the development in the evolutionary experienec of ancestors. This constitution includes the rather specific instincts we have mentioned. It also includes more general innate capacities and powers which are more variable in their manifestations in individuals than the more specific instincts.

Among such qualities we may mention, as examples, the capacity for more than ordinary achievement in science, business, mathematics, politics, painting, music, etc. The possession of such capacities apparently does not result entirely from the inheritance of a practically perfect nervous organization. They appear to be, in large part, innate

mental tendencies, qualities, and capacities. The inborn capacities must be developed into capabilities through education. The born salesman needs education to fully develop his ability. This inherited mental constitution determines largely the trend of the development of the nervous organization acquired during the life of the individual. An instinct acquired during remote evolutionary experience is a trace of that experience persisting in the mental and physical constitution of the individual. This innate trace of remote racial experience is comparable to a memory of such experience. Through these traces the lessons of past experience indelibly impressed on the mental and physical constitution of the individual are operative in guiding him through present experience.

In the instinctive striving there may be, previous to actual experience, some faint perception of the end at which the impulse aims. In the fear instinct this preperception may take the form of a very imperfectly defined "Danger—there! This way to escape!" In carrying out an instinct, the stimulating object is regarded as a thing with which one is greatly concerned. There is certainly present also the feeling that something worth while is being gained by the behaviour.

The awareness of why the act is worth while could arise only through the awakening of innate knowledge along with the innate feeling and impulse.

The traces of previous experience preserved in

the mental constitution and manifested as instincts work through more or less perfectly preformed pathways of neural discharge. The less perfectly or less completely these pathways are organized, the more important is the function performed by the traces of past experience existing in consciousness, and the more necessary it is to develop intelligence to guide in the response to the stimulus.

MODIFICATION OF INSTINCTS

Instinctive behaviour may be analyzed into the following important elements: The perception of an object which serves as the stimulus; the emotion and impulse aroused by the stimulus; the form of behaviour which results as the response to the stimulus.

One may learn to improve the instinctive response to a stimulus. He may learn to discriminate the circumstances under which he should make the response, from those under which he should not make it. He may, through experience, associate with the object which first called forth the response, another feeling and impulse which will lead to a different response. "The burnt child dreads the fire." One may learn to respond instinctively to objects which at first failed to arouse such a response.

An instinct may be modified by associating with the object and the feeling it arouses another form of response. The response to the feeling and the impulse aroused by the stimulus is shunted off into another line of action. In this way one may be led

to make the conventional rather than the primitive response to the stimulus. Actions are thus made to conform to the forms of conduct prescribed by society. The sex instincts, for example, require such modification.

Instincts may be modified by refining, sublimating, generalizing, and co-ordinating them. The gregarious, co-operating, and fighting instincts and those of emulation, play, etc., are thus modified by properly conducted sports. One who fights for victory according to the rules of the game is likely to become one who fights the battles of business and political life in accordance with the principles which should govern conduct in those spheres.

WILL TO LIVE

In the earliest form of conscious life there was probably simply a vague consciousness of impulsive-process-going-on and of satisfaction-accompany-the-going-on. It was the will to live seeking and finding satisfaction in the conscious-impulsive-satisfying-activity which constituted the process of living.

The general will to gain satisfaction through carrying out impulse has come, through the process of evolution, to manifest itself along many different lines. The various instinctive predispositions serve to guide impulsive activities into the lines along which they most profitably seek for satisfaction. They are differentiations of the original capability of experiencing impulse and of feeling satisfaction in carrying it out. As such they must be dominated and correlated by the general will so that they will work together harmoniously, each contributing duly to the satisfaction of all.

INSTINCT OF SELF-REALIZATION

We have found that we can trace one all inclusive, all pervasive instinct manifesting itself in the various special instincts. We may call this the instinct of self-realization. It is essentially a process of seeking satisfaction through carrying out impulse.

In one aspect, the instincts are processes of react-

ing to the environment. The form of the reaction is determined by a correlation existing between certain objects of consciousness and certain qualities in the physical and mental constitution of the individual. In another aspect, since the behaviour resulting from the stimulus is determined by the psychical and physical constitution, this behaviour may be regarded as a form of self expression.

The instincts are predispositions to act in such ways as will best promote one's well-being, or self-realization. The instinct of self-realization works blindly at first, groping its way by mere impulse. As man's experience widens and as his intelligence increases, the character of this predominating instinct becomes more clearly revealed. It develops into an ideal of well-being. The ideal is that of a form of well-being to be attained by developing all one's capacities into capabilities of securing satisfaction and of exercising these capabilities, each with due regard to the other, and of safeguarding them.

Some of the instincts aim largely at making one's material environment subservient to the progressive approximation to the ideal of well-being or self-realization. Among them are constructiveness and acquisitiveness.

Other instincts, such as play, curiosity, and especially imitation, have for their purpose the improvement of well-being through giving a better mastery of the objects of both the material and social environments so that they may be employed more efficiently as means of securing satisfaction.

Some of the instincts concerned with the social environment are egoistic or seek for the well-being of one's self. Some are altruistic and seek for the well-being of others. Some are antisocial, others are pro-soical.

Among the egoistic or self seeking instincts are pugnacity, fear, self assertion, rivalry, shyness, secretiveness.

Teasing and the predatory instinct are antisocial.

The altruistic instincts are general pro-social. That is, they aim at promoting the well-being of others. Such are parenthood, sympathy, modesty, sexual love, respect for others, co-operation, gregariousness, loyalty, and subordination to superiors.

No man can come into being or develop his capacities apart from others. Born into collective life man's well-being must be brought about through co-operation with others, in collective life. The will to live in its various lines of instinctive development clearly aims at self-realization in the give and receive of association with others. The state of well-being aimed at is a state of social well-being in which each will profit in proportion to his service to others, and only as he renders such service. The supreme good is a common good, to be attained in a community, the members of which are mutually dependent and mutually helpful. One just as naturally feels regard for the collective welfare, as for his individual welfare.

The striving for self-realization is a striving for

such a condition of collective well-being as we have just explained. The ideal of self-realization has been formulated through co-operative experience and co-operative reflection on experience. It is an end not fully attainable, but to which we can always approach more closely.

Man is a social being with broadly diversified interests and concerns, as well as a marvelous machine for performing work. His well-being can be promoted only by providing opportunities and stimuli leading to the satisfaction of his various lines of interest. This fact should be kept in mind in planning welfare work.

MORAL INTEREST

The instinct of self-realization has developed into the interest of self-realization, which is known as the moral interest. This moral interest is an interest in well-being, or in well-doing, as being is in this sense a process of doing. In a condition of well-being, or well-doing, all of one's interests, both egoistic and altruistic, would be developed in proportion to his true needs. All of these interests would be satisfied with due regard to the well-being of the organic individual whole, of which they are characteristics. It is a condition in which one gains a harmonious satisfaction for interests which have been developed in proportion to needs.

Moral acts are acts which concern the social well-being. Acts which affect the efficiency of any individual member of society, affect the well-being of the

society of which he is a member. Society must see that its various members keep themselves in a condition to render efficient service, just as a person must see to it that his various organs are working properly. Hence society lays down rules to which the behaviour of the individual must conform.

The moral judgment is the judgment of society, which has followed and handed down, in tradition and custom the best judgments of the moral leaders of the past. This judgment voices the collective racial experience as to acts which tend to hinder or promote the individual and social well-being.

By our instinctive endowment we are sensitive to the praise and blame, or approval and disapproval of our fellows and conform largely to their will. Those who do not so conform are penalized in various ways. Through suggestion and imitation we accept the maxims and traditions in which are formulated the racial experience as to what is good or bad.

One gets his ideal of conduct as a suggestion from others. When he comes to see that this ideal aims at the true co-ordination of collective and individual welfare, he may strive to promote this welfare, regardless of the collective approval, or disapproval, of his acts.

The sentiments and impulses, which give force to the moral ideal in controlling conduct, have developed under educational influences from various altruistic and egoistic, instinctive tendencies. The moral ideal may thus be conceived as developing

from impulses and capacities which have their origin in the Eternal Consciousness or Divine Spirit which is manifested in us.

The Universal Will to Live manifests itself in all living things. Its impulsive force becomes manifested along the lines of the various instinctive tendencies. In our conscious experiences we become aware of these native impulses and capacities. As experience develops, intelligence furnishes guidance in efforts to seek satisfaction for them. But the form into which the moral personality develops is determined mainly by social agencies.

The instinctive predispositions have been developed in the course of evolution as a means of promoting well-being. They are tendencies to feel and act in a certain way in regard to things which concern well-being. When one becomes aware of this concern with a thing, he experiences a desire and an impulse to strive for it, or an aversion and an impulse to strive away from it, according to whether it concerns his well-being favorably or unfavorably. The person is said to have an interest in the things which thus concern well-being.

The things which concern well-being similarly are arranged in a general class. General lines of concern come to be recognized. Around each line of concern, of which one becomes conscious, is organized a system of tendencies to feel and act. The habits of responding to such classes of objects with co-ordinated tendencies to feel and act, are known as

interests. When an interest has been formed, as soon as an object is recognized as belonging to the general class, it arouses the desire and impulse characteristic of interest.

The individual is said to be adapted to his environment by his instinctive tendencies. However, these tendencies seem rather to be the agencies by which the environment is made to promote the satisfaction of the individual. The instincts act as guides before experience has been sufficiently developed to deal with things which concern well-being by furthering or hindering it. They guide one to the satisfaction of certain needs not yet felt to be such. Where the instincts are lacking in perfection or definiteness, consciousness steps in and undertakes to do what preformed structure has left undone, in the way of making the environment subservient to human interests.

Man grows gradually into a consciousness, or realization, that certain classes of things concern his well-being in certain ways. The ends toward which the instincts impel one come to be formulated as aims or purposes to be desired. The line which the development of the individual actually follows is a resultant, or mean, of two component factors. The two factors determining development are instinctive endowment and educational influence.

When the conscious realization of concern is awakened, it takes the form known as interest. Conscious processes are interesting when some ca-

pacity of the self is finding satisfaction in the activities. Man is impelled to action through a conception of himself as satisfied as the result of action. The foretaste of satisfaction, which arises from representing or picturing one's self as having gained the object, or attained the interesting or desired end, arouses the impulse to the action and leads to such a rearrangement of conditions as will bring about the anticipated satisfaction.

TWO MEANINGS OF INTEREST

The word interest is used in two different senses which should be distinguished from each other. In the wider meaning of the term, one is interested in all that concerns his need or welfare, though he may not be conscious of the concern. In this sense one may ignorantly do a thing contrary to his interest, if he is unaware of the effect the act will have on his well-being.

In the psychological sense, an interest is a conscious realization that a general class of things concerns one's need or well-being. The feeling of interest varies with the importance attributed to the thing as a means of affecting the well-being favorably or unfavorably.

The consciousness of favorable concern arouses a feeling of pleasure, a foretaste of the satisfaction to be attained, and a striving or impulse to attain it. This complex state is known as a desire.

The consciousness of unfavorable concern arouses

a feeling of pain, a foretaste of dissatisfaction, and an impulse of aversion, or a striving away from.

CLASSIFICATION OF INTERESTS

The experience of the race in working out the due co-ordination and satisfaction of the various interests has found that they may be dealt with most conveniently, in theory and in practice, when they are grouped in a few important classes.

In the fully developed consciousness, an interest as a motive impelling to action, will be found to have two aspects. In one aspect it is an interest in a special line of activity. In another aspect the special line of interest is a manifestation of the general interest in self realization which includes all other interests.

The all pervading and all inclusive interest in self realization or well-being, manifests itself in the moral interest. The moral interest is the interest in correlating and co-ordinating the special lines of interest. The special lines of interest include politico-legal, philanthropy, sociability, health, knowledge and educational skill, wealth, beauty, vocation, family and home and recreation.

The interests are the ends which the instincts serve, brought into clear consciousness, and developed into habitual lines of desiring and striving.

MORALITY—THE MAJOR INTEREST

The interest in general well-being, or in properly

co-ordinated satisfaction along the various lines of interest, is known as the moral interest. The feelings of interest which attach themselves to matters which concern general well-being, or self-realization, are known as feelings of oughtness, or obligation.

The feelings of rightness and wrongness attach themselves to acts which tend to further or hinder general well-being. These feelings are manifested at first as blind instinctive impulses. They predispose one to do the right act and not to do the wrong one.

Through educational development, which is guided by social influences, the feelings of obligation, or oughtness, tend to lose their blind instinctive character. As experience develops, one gains the ability to appraise the tendency of the acts to hinder or further general well-being. Wrong acts are seen to be acts which have bad results. Right acts are those which bring good results. However, the obligation feelings to which judgments of rightness and wrongness give rise, still retain their instinctively imperative character.

Goodness means fitness to promote well-being. A thing is good only as it is good for something. It is good only when it is adapted to serve as a means of attaining a good purpose. Goodness can be estimated only in relation to the end to be served. Good and bad things are things which have a favorable or unfavorable bearing on well-being.

The enlightened conscience aims at a progressively realized state of well-being, to be brought about through a happy adjustment, or co-ordination, and satisfaction of the egoistic interests, which have regard for self, and of the altruistic interests, which have regard for others. It aims to harmonize the various interests of the individual and the interests of society so as to achieve a higher and richer life for all. Conscience aims to bring the interests of the individual into harmony with the great social will, and with the Universal Will of which it is a manifestation.

Moral principles arise from the recognition that acts concern both individual and social well-being. They are general principles to which acts must conform in order to promote this well-being. They are rules for playing the game of life. The moral virtues are habits of acting in accordance with moral principles.

The principles to which acts should conform, in order that they may be regarded as moral, include, among others, honesty, truthfulness, fidelity, loyalty, justice, mercy, courage, industry, thrift, frugality, temperance, chastity, modesty. They are the principles by which impulses to action along the line of the various interests should be appraised, to see whether they should be held in check or strengthened.

PHILANTHROPY INTEREST

From the various predispositions to perform actions which promote the well-being of others has developed the interest in philanthropy. This interest has its roots in gregariousness, the parental instinct, the tender emotion, affection, sympathy, cooperation, loyalty to group interests, filial devotion, respect for others, self-subjection, religion, etc. It is the interest in rendering social service for which no service, or means of securing service, is to be received in exchange. This distinguishes it from business, which is the rendering of service for a consideration.

Many confuse philanthropy with the moral interest. However, philanthropy is merely one among several lines of well-doing with which the moral interest is concerned. The philanthropy interest must be co-ordinated and correlated with the sociability, health, education, wealth, beauty, recreation, vocation, family and home, and politico-legal interests, in accordance with moral principles. One is under obligation to develop and exercise his own capabilities along all these lines. He is also under obligation to provide, through exercise of his philanthropy interest, that others have opportunity and incentive to develop their interests along the same lines. The moral interest is coextensive with life interests.

POLITICO-LEGAL INTEREST

The politico-legal interest aims to render service to the individual and to society through organized co-operative effort. The political organization is the machinery employed for rendering this service. Through legislation the legal interest aims to enact the laws which will establish the form of organization which will be most efficient in promoting individual and collective well-being through co-operative effort.

The legal interest also aims to make laws which record the consensus of moral judgment, to establish judicial machinery to apply this judgment to concrete cases, and to provide for executives to enforce the judicial decisions.

FAMILY AND HOME INTEREST

The family interest aims at promoting the various interests of those for whom conjugal, or parental, or filial affection exists. The members of the family are interested in the home as a means of satisfying a great variety of interests.

Service to the home and family is the vocation of a large majority of women. It also makes large demands on women who have other vocations, and on all normal men.

The home interest embraces all the activities which aim at the well-being of the members of the home and all the things with which these activities

are concerned. The home and family interest is concerned with things pertaining to domestic economy and domestic art. Among them are wholesome and appetizing food, architecture, heating, ventilating, and lighting, domestic art, decorations, furnishing, sewing and various forms of household activities which it is hardly necessary to mention. The home interest embraces all the home activities which aim at the well-being of the members of the home, and all the things with which the attainment of this well-being is concerned.

SOCIABILITY INTEREST

This interest impels one to strive to secure personal recognition along social, civic, political, business, and other lines. It gives rise to the ambition to be esteemed and reckoned with by one's fellows. Whatever gives one advantage in competition with others, or in influencing and leading others, or makes him looked up to, admired, or considered by others, appeals to this interest and will be desired when the social advantage to be gained by means of it is made clear.

For example, a new fashion is taken up as a means of securing social recognition, or prestige. What makes one appear well dressed is desired as a means of securing recognition from his business associates. See the discussion of "Fashion" in the "Psychology for Business Efficiency". Posting the names and records of the men who do the most ef-

fective work in a factory may stimulate others to do much better work in order to secure such recognition. This appeals to the instincts of emulation, rivalry, and self-assertion, which are elements of this interest.

HEALTH INTEREST

The health interest attaches itself to anything which prevents or cures disease, or prevents accident. It is concerned with wholesome food, water, light, ventilation, dwelling place, conditions of labor, physical culture, and athletics.

EDUCATION INTEREST

The educational interest is concerned with whatever increases knowledge, or wisdom, or makes for efficiency in economic, social, or political activities, or enlightens one as to a better means of self-realization along the line of any recognized interest. It makes for culture as its ideal. Culture is knowledge, appreciation, and utilization of the things which give enduring satisfaction.

ÆSTHETIC INTEREST

This is generally known as the interest in beauty. It is concerned with such things as the theater, literature, music, painting, sculpture, architecture, landscape gardening, beautifying the person, the home, and its furnishings, and surroundings, and with the beauty of natural objects, etc.

WEALTH INTEREST

The wealth interest aims at mastery of the material environment. Whatever increases ability to earn money, or save money, or reduces expenses, appeals to this interest.

It is a superficial and false ideal which makes the pursuit of wealth the supreme end in life. The attainment of wealth is not a true criterion of success. The amount of wealth attained is only one among several elements which must be taken into consideration in estimating business success. Riches acquired without adequate beneficial service rendered to others, in return for the wealth secured, is exploitation. It departs from the principle of the square deal, and is bad business.

The attainment of business success is only one element involved in attaining broad human success. The attainment of wealth is desirable mainly as a means of securing satisfaction along other lines of self-realization.

Two motives contribute largely to the effective performance of the economic activities of business. One motive is to meet the demands for service to the well-being of others, which the business aims to satisfy. This is the vocational interest. The other motive is to provide the means of satisfying not only the economic interests of the worker, but also his æsthetic, educational, sociability, health and recreation interests as well. The economic, or wealth,

interest is only one of several belonging to the same general class. These interests are manifested in many sub-varieties and combinations. The moral interest aims to so co-ordinate their various activities that all will receive a degree of satisfaction such as will make them contribute duly and harmoniously to collective well-being.

VOCATION INTEREST

In one aspect, the vocation interest is an interest in rendering to others service which will promote their well-being. The vocation interest aims also to make the rendering of service to others, a means of securing the things which will promote one's own well-being. The two motives working together aim at a mutually advantageous exchange of services, or of means of securing service.

Every one may rightly demand the satisfaction of his own interest in well-being, provided he renders an equivalent service in promoting the well-being of others.

Most people are under the necessity of making a living, in order that they may be able to meet their obligations to enrich the well-being of themselves and others. Vocational activities are directed along certain specific lines largely as a result of the fact that efforts to satisfy the needs must be correlated and concentrated along rather narrow lines, in order that they may become efficient and deserve and receive reward.

Work which is taken up merely because it affords an opportunity to make a living may lack qualities which are very essential to the satisfaction of the vocational interest. In order to gain due satisfaction for the vocational interest, one should specialize his efforts along some line in which he feels he is rendering value received to others in return for the compensation he receives for his work. Vocation should be chosen along lines of fitness to serve, not merely along the lines in which it is possible that the greatest financial returns may be secured for serving. The feeling that the activities are worth while helps make them interesting. The satisfaction which comes from doing worth-while things is one of the greatest rewards that service can gain.

Vocation means a calling to render service to others along the line for which one's abilities best fit him. The choice of a vocation is the selection and devotion of one's self to activities one feels called upon to perform. To be truly vocational, the activities should be interesting. The achievement of their end should bring satisfaction. An occupation which meets the demands of one's nature, and in which one's aptitudes and abilities fit him to be successful in rendering service to others, is the greatest source of lasting happiness.

Work which really meets the demands of the vocational interest may at first be neutral in feeling or even distasteful. Yet if the occupation, as a whole, is really felt to be worth while, much of the

work will take on an acquired interest. It is more than likely that work, which as a whole satisfies the requirements of the vocational interest, will always be found to involve distasteful, or painful activities.

When one has chosen his vocation, he should say to himself: "This is my job. It is up to me to do it, or to be done for. I will do it."

Practical necessity usually compels one to confine his vocational activities to a rather narrow line. His vocation can not afford satisfaction along all the lines of his interests. It must be regarded as the means of securing that which can be used to secure satisfaction along avocational lines.

One's vocational activities do not completely fulfill his obligations to render service to others. Part of one's serious efforts at self-realization must be devoted to rendering service to others, for which the only compensation is the satisfaction resulting from the consciousness of the service rendered. One must render a vocational service to others, as individuals, and as members of family, political, civic, and other social groups.

To successfully perform serious work of the more important sort, intense voluntary concentration must be maintained for a considerable period of time. Such work involves dealing with theoretical or practical problems which must be solved in order to promote well-being. The problem may be concerned with adapting or employing external means to satisfy a felt need. Or, the problem may be of the in-

tellectual sort which aims at satisfying the felt need for orderliness and consistency in our knowledge.

Being thwarted in the solution of a problem gives displeasure and adds to the fatigue of the work. A satisfactory solution of a problem, or the consciousness of progress toward a solution, gives pleasure. Such pleasure plays a wholesome part in the economy of life.

Even when work is rich in the amount of such pleasure it gives, it finally becomes fatiguing and demands periods for recuperation and recreation. The fatigue and the need for means of recuperation are much greater in lines of work which are largely routine and disagreeable in character.

WORK AND THE NEED FOR RECREATION

Work that is full of interest and pleasure finally becomes fatiguing and demands periods for recreation. Life grows wearisome as it follows the daily grind of routine in shop, or store, or home, even if the occupation, on the whole, is congenial. Such work may grow repulsive, if persisted in too long without interruption.

The dull rounds of some forms of monotonous toil become deadening in their humdrum influence. One may become so desperate as to be ready to resort even to crime to break the monotony, if no other means is available. Even if sufficient leisure is provided for rest and sleep, they alone are not sufficient to restore the exhausted energies of one employed

in the more deadening occupations. Such a person can not come back to work with a wholesome feeling, unless some form of recreation is provided.

One employed regularly at a congenial occupation will have many interests not sufficiently exercised in his ordinary work. He will become conscious of the need of satisfying these interests.

The brain cells corresponding to various developed interests should be stimulated, to use up the accumulated energy. In this way alone can the capacity for supplying energy be kept in efficient working. Atrophy, or wasting away of capacity, follows disuse.

A disagreeable emotional tone arises from developed interests which are denied wholesome stimulation and satisfaction. A similar feeling results from interests so stimulated that an undue amount of energy is used up. Such an unpleasant emotion spreads a disagreeable feeling over vocational or avocational activities, which would otherwise have an agreeable tone. When work is monotonous or disagreable, the unpleasant feeling, arising from the understimulated or overstimulated interests, may add to the dislike for it to such an extent as to make it practically unbearable.

RECREATION INTEREST

The recreation interest plays a very important part in the activities of a well ordered life. This interest demands that vocational and avocational work

must not be allowed to fill all one's time. One must have time to engage in the satisfaction of other interests. One must also have opportunity, and proper stimulus and incentive, to insure the exercise of otherwise neglected interests.

Recreation may be satisfactory in character, though it does not fully exercise all one's interests outside his regular line of work. Practical considerations generally make it necessary for one to seek his recreation along rather narrow lines of interest. The instinctive impulses leading to recreational activities thus become systematized by habit along special lines, such as the theatre, music, art, literature, travel, games, sports, dancing, social functions, study, forms of manual work, etc.

Recreational activities should appeal to existing interests not sufficiently stimulated in ordinary work. They should have the character of novelty and contrast, when compared with regular vocational and avocational work. They should arouse adequate but not excessive activity. They should give rise to a pleasurable feeling which tends to persist as a permanent emotional tone. Recreation should also provide for bodily exercise of a sort and kind necessary to keep the various organs of the body in good working condition.

The agreeable emotional tone aroused by activities which meet these requirements will displace the disagreeable feelings resulting from the deadening routine of work, or from fatigue, or lack of proper ex-

ercise and satisfaction of developed interests. This pleasurable feeling pervades the conscious processes involved in ordinary work, and adds to the efficiency of the efforts.

Proper recreational activities facilitate the gaining of energy during the periods of rest, and create conditions favorable to the performance of the various physiological activities which make one efficient. To be classed properly as recreational, activities must re-create, or create again, one's powers of body and mind.

Exercising interests involved in regular work, along different but more pleasurable lines, may be recreative in character, if the demands on the interests have not already been too great. The professional baseball player may find recreation in playing golf. One whose work is routine and not too fatiguing may seek recreation in matters involving close concentration of the attention and sustained mental effort, and vice versa.

The instinctive demand for recreation is one of nature's provisions for keeping alive and developing, through exercise, capacities which would otherwise die. It is also a provision for renewing the waning powers of mind and body, and keeping one's working efficiency up to the standard.

The gregarious instinct is a strong impelling force in choosing the forms of recreation. It leads one to seek his recreation in the company of others. The sympathetic instinct also leads one to seek to share

the emotions of others and to share his emotions with them.

The play instinct plays an important part in the development and form of recreational activities. It, and many other subjects, taken up briefly, in this book, are discussed more fully in the author's "Psychology for Business Efficiency."

The recreation interest may be concerned with satisfying any one, or several, of the other interests previously mentioned. The end to be gained in doing a thing as a means of satisfying the recreation interest is different from the end sought in exercising the interest as part of the regular work of life. Yet one who understands the true nature and function of recreation, can often find, or make, much of his daily work recreative in character.

Almost any line of activity may be undertaken as a means of securing recreation. Many things are sold almost solely for recreational purposes.

One who is selling an automobile, for example, as a means of recreation will have to talk along quite a different line from one who is selling an auto truck as a means of satisfying the wealth interest. The recreational interest aims at novelty, contrast through change of scene or form of activity, restoration of mental and physical energy used up by serious work, and the displacement of a disagreeable or neutral, or less pleasurable state of feeling by a pleasurable emotional state; all of which tends to bring about a well-founded assurance of mental and

physical fitness. The seller of an automobile may also, of course, appeal effectively to the sociability and other interests.

The things with which the recreation interest are concerned are innumerable. They include the theater, music, literature, lines of study, art, games, travel, hunting, fishing, social activities, constructiveness applied in various manual occupations, agriculture, athletic sports, swimming, boating, etc.

CORRELATION AND CO-ORDINATION OF INTERESTS

Every one has philanthropy, politico-legal, sociability, health, education, wealth, beauty, vocation, recreation and family and home interests. He also has a moral interest which impels him to strive for self-realization along the lines of all these interests. He is under obligation to have due regard for the other interests while seeking satisfaction for any particular interest.

As a matter of fact, as a result of deficiency in natural endowment or of imperfect educational development, one may not strive for the satisfaction of his various interests in such a way that each will contribute its part, harmoniously with the others, to the promotion of his general well-being.

One may not have shown due regard for his interests in choosing and pursuing his vocation. He may be held by deeply ingrained habit to seek excessive satisfaction for certain interests. In such a case, certain interests will have been neglected so that they have not developed properly, or so that they have died out from lack of exercise.

Health may be knowingly disregarded in the struggle for wealth or pleasure. Or one may struggle according to his light, but he may not have been fully awakened (or may have gone to sleep) to the

importance of the realization of his interest in certain lines. One may be alive to the importance of physical well-being, yet he may not clearly realize the importance of a certain factor as a means of impairing or improving physical efficiency.

Success in attaining satisfaction for one's vocational interest in a business, professional, scientific, artistic, political, or other career can be secured only through a long-continued concentrated process of thinking and striving.

The aim in the background of consciousness holds one continuously to a definite line of effort. The satisfaction resulting from the partial successes achieved, and the foretaste of a fuller satisfaction to be obtained from the still greater successes one believes he can achieve, spur one on to greater and more concentrated effort. One sets his eye on the end to be reached and struggles on, stimulated rather than daunted by obstacles, unrelentingly toward his goal.

The business one builds up in this way becomes flesh of one's flesh and blood of his blood. It grows to be another part of himself. Such an one is always in danger of becoming intolerant of interest in everything that does not pertain to his business. He is hypnotized by concentrating his attention on the fascinating lure of a great vocational success.

One is justified in making his vocation a major interest in life. But he is ever in danger that his vision will be so short in range and narrow in scope

that he will wake up some day to the fact that he has been merely making the means for securing a living. He may come to realize, when it is too late, that he has lost for all time the greater opportunity of making a life rich in the nobler, more significant, more abiding elements of joyous satisfaction.

He has become hardened, narrowed, and unsympathetic. He has failed to gain the satisfaction to be derived from disinterestedly serving the well-being of others, from the unselfish friendship, from broad interest in learning, in literature, art, health, and life-giving recreation.

The supreme interest in life is the interest in symmetrical, harmonious, many-sided development, known as self-realization. One should be ever on his guard against exalting into a position of supreme, if not sole importance, one of the interests which should really be subsidiary to the interest in being a fully developed person. In the strenuous drive for great achievement, interests of vital importance are likely to become stunted or atrophied because they have no chance to develop through exercise. Eternal vigilance and effort, alone, will enable one to avoid sacrificing the richer, nobler self on the altar of a narrow success.

While many fail in this way, many more fail because they weakly follow the course of least resistance. They take a spineless, purposeless attitude toward life. They need to feel the spur of great ambition.

This discussion must have made it clear that there is a very complex correlation between the interests as they habitually manifest themselves as desire in the ordinary individual.

INTEREST, DESIRE, VALUE, AND PRICE

Interests are habits of attending, thinking, feeling, desire, or aversion and striving away from or striving toward certain classes of objects.

A desire is both a painful sense of **something** lacking and a pleasurable foretaste of the satisfaction to be derived from securing the thing which will supply the lack. The foretaste of satisfaction is usually the more prominent or focal element in the desire. In this case the painful element will be found occupying a more or less prominent place in the margin. However, the painful element may be in the focus and the pleasure to be gained in the margin of consciousness. Each heightens the other by way of contrast. Both together give strength to the desire.

The desires have normal strength, and the values attributed to the things are normal values, when they are proportional to the various services the desired things will render in promoting well-being, or harmonious self-realization, in which all the lines of interest are satisfied in due proportion. Desires are normal when they are proportional to the intrinsic value of things. By intrinsic value we mean value in promoting general well-being. Desires and valuations are subnormal if they fall short when measured by this standard. They are inflated to the

extent that they are in excess when measured by that standard. Inflated value and desire, and subnormal value and desire, are abnormal. Desire and valuation are perverted when the desire is attached to, and value is attributed to, a thing which does not contribute to well-being. Intrinsic value results from the possession of qualities which fit a thing to serve as a means of contributing to normal satisfaction of interests. By normal satisfaction is meant satisfaction, the value of which is appraised by applying the norm of self-realization.

Commercial valuation, or determining the price one can afford to pay for a thing, is arrived at by determining the balance of gain or loss in well-being which will result from the expenditure, or amount of the service, or its equivalent means of securing satisfaction, which is required to be given in exchange for the service in promoting well-being which will be gained by securing the desired thing.

The intrinsic value of a thing can not be made the basis for determining the price which may rightly or fairly be asked for it. A man of great wealth might conceivably be placed in circumstances such that a drink of water, or a supply of fresh air, or something to eat, would be of more value to him than all his wealth. In such a case, one who supplied the water, air, or food would not be justified in requiring all the man's wealth in exchange for it, if supplying it involved very slight sacrifice on his part. One who supplies a need is entitled to payment, not

in proportion to the extent of the need, but in proportion to the services which must be rendered in order that the need may be supplied.

The price asked should not be in proportion to the value of the serviceable thing offered for sale. It should rather be estimated on a basis of securing a fair return for all that is contributed by the services rendered in making the serviceable thing available. Such contributions may be made in preparing the raw material and in the industrial processes of manufacturing it, in furnishing capital to carry on the industry, and ability to organize and manage it; or in transporting or selling the raw material or finished product. All who render service in any of these lines are entitled to a fair compensation. Price should be based on the cost of producing and marketing, and should allow a fair margin of profit to all rendering services in these lines. All parties to the exchange should profit by the transaction. Price not based fairly on the service rendered in producing and marketing has been inflated through control, or reduced through competition.

It is extortion, exploitation, or perversion, and is essentially fraudulent if, through monopolistic combination, or other acts in restraint of trade, or through misrepresentation, or overpersuasion in selling, one exacts an unearned increment of profit. Any unnecessary inflation of prices, or any disproportionate stimulation of interest, or any perversion

of interest, is bad business, and hence is bad salesmanship.

Governments grant to inventors a monopoly lasting for a few years, in order to reward them for the benefits they have conferred on society in making the invention and to stimulate the production of inventions.

Continual success in business depends primarily on maintaining the good will created, through lowering the cost of production and price and increasing the serviceability as much as the highest efficiency and fair returns for services rendered will permit.

The salesman should set forth clearly the normal value of the thing. It is his duty also to see that the price secured is not based on the serviceability of the thing, but that it is fairly proportionate to services rendered in making the serviceable thing available. A sale is dishonestly made when the price received is knowingly greater than the normal serviceability of the thing sold. When salesmanship secures a price in excess of normal serviceability, it is guilty of exploitation. When salesmanship secures a price which does not properly pay for services rendered in producing and marketing, it is guilty of inefficiency.

TRUTH, THE IDEAL OF SELLING

Truth, as the ideal of the Associated Advertising Clubs of the World, requires on the one hand a truthful and adequate setting forth of serviceability in promoting well-being. On the other hand, conformity to the ideal of truth demands that the price asked must be fairly proportioned to the services contributed in producing and marketing. This is the ideal to which all salesmanship should strive to realize.

"Caveat emptor," let the buyer take care, can no longer control in modern marketing. Good will is based fundamentally on honest and efficient service. The continued prosperity of a business depends on good will.

Producers and consumers, as a whole, are mutually dependent on each other. Good business has regard to the well-being of both parties to every business transaction. Benefits and the rendering of services must be mutually advantageous, in order that capacity to produce and capacity to consume may develop equally.

Truthfulness in salesmanship consists in setting forth adequately the article's serviceability to the person to whom it is sold. The truthful salesman will not understate, or overstate, or exaggerate this serviceability. He will not exact or take from the

customer more than a fair price for the service the article will render to him. Such truthfulness is demanded of salesmen in accordance with the moral principles which apply to all walks of life.

Truthfulness in selling is not an obligation arbitrarily imposed on a salesman. It is the only foundation on which permanent business success can be built. Efficient salesmanship must render a service which creates confidence and begets good will. It is not sufficient that the salesman honestly believes that the sale he makes will prove satisfactory. He must have such knowledge of the serviceable qualities of the thing he sells, of the general demands of business, and of the requirements of the buyer that he will be able to make satisfactory sales.

The salesman who renders the best service as a business-builder will carefully avoid making sales that do not render profitable service to the interests of the buyer. He must know the truth about the value-giving qualities of his article. Without exaggeration or distortion he must present this truth to the buyer.

The salesman, to a certain extent, relies on the confidence and good will of the buyer, on suggestion, on personality, on tactful approach, on pleasing delivery of the selling argument, on wording the selling talk in such a way that it will have great effectiveness in arousing emotional activity and volitional impulses which tend to close the sale. It is proper that the salesman avail himself of all the effective

aids to selling. Such means are employed legitimately only so far as the salesman sees to it that, in making the sale, he is profitably serving the interests of the buyer.

The salesman may properly resort to an appeal to various emotions and to suggestion to action to get the buyer to accept the estimate the salesman puts on the service the value-giving qualities will render, provided the salesman's estimate is fairly proportional to the satisfaction the buyer will derive from the purchase. It is also true that the purchase must not involve undue sacrifice of other interests.

It is the salesman's duty to get a fair return for the service rendered. Getting more in return than the service rendered is worth, is not salesmanship. The seller is working a confidence game. He is obtaining money under false pretenses.

The article will render full service to the consumer, only as he has clearly in mind the service the value-giving qualities of the article fit it to render. Even if the sale is made largely by emotional appeal or by suggestion, the salesman should see that the buyer is correctly informed about the article. The salesman should make it a point to show the buyer how to get the serviceability out of the article, even if the sale can be made with less effort than that requires.

In selling to a reseller, the salesman can often make clear the best methods of merchandizing, of financing, and of creating good will. He is entitled

to adequate return for such service. However, the return should come in the increased profits which come from the increased market for the goods.

AWAKENING LATENT NEEDS

A market is a class of people whose needs and interests make them possible consumers, and who have sufficient means to enable them to purchase when the latent desire has been sufficiently stimulated. The market may be increased by stimulating desire; or by lowering the price so that a larger number will be able to spend the amount required to secure the satisfaction for their desires.

Men are not intuitively aware of their real needs. The existence of the need must be made clear by educational means. It is necessary to undertake consciously and systematically to develop latent capacity into an active tendency to desire.

The salesman and the advertiser perform an important educational function in creating desire. The awakened desire to satisfy the need one is thus made aware of, stimulates him to develop greater efficiency in serving the needs of others in order to get the means of satisfying his own desires. The desires thus awakened by the salesman and advertiser stimulate the men in whom they are awakened to more efficient service and thus increase production in other lines.

AROUSING DESIRE

Success in selling depends on finding what interests of the consumer are concerned with the goods so that appeal may be directed to them in such a way as to arouse desire. It will depend also on wisdom in selecting the qualities of the article which give it value as a means of satisfying desire; and on skill in presenting these value-giving qualities in such a way as to create desire for the article and arouse an impulse to buy it. The tendency to buy may be strengthened indirectly by anything which strengthens the desire. It may be strengthened directly by suggestion, or command, which stimulates the impulse more strongly.

No strong desire to possess a thing can be aroused unless an appeal is made to some form in which one of the instinctive or developed interests is manifested. When an interest exists vividly in the psychological sense, that is when one is keenly conscious of the need, all that is required to arouse desire is to show that the thing is a serviceable and available means of satisfying the need.

When the interest exists merely in the broader sense in which the fact of the need is not recognized, the salesman's task is to make clear the extent to which the well-being is concerned with the thing offered for sale.

The salesman must determine whether it will be advantageous to awaken the impulse of striving away from the unsatisfactory condition of affairs, as well as the impulse of striving to gain the satisfaction to be secured by making the purchase.

When the demand already exists but the sense of something lacking is a familiar and tolerated sore, it may be necessary to dig into the tender spot and irritate it afresh, to give it potency in impelling to action. People become dulled and apathetic to old needs which they have had little hope of being able to satisfy. To arouse such a person to action one must not merely kindle the hope anew. He must reawaken keen antipathy to the evil which has come to be regarded as necessary and to be ignored. He must also awaken a foretaste of the satisfaction to be gained by securing the article. He will then have created a desire in which the impulses are both pushing and pulling one on to buy the thing.

A desire is an impulse to action as well as a feeling. The impulse is carried out into action when one sees his way clear to securing the means of satisfying the interest from which the feeling and impulse arise.

The means of satisfying a need is a want. Desire and want, and demand and supply, are similar pairs of similarly related terms.

The reader who wishes to gain more insight into the bearing on salesmanship, of processes and factors of thinking, feeling, and acting will find addi-

tional matter in the author's "Psychology for Business Efficiency." See especially the topics, "Fashion," "Leadership," "Creating Good Will in Business," etc.

The things with which the various instincts and interests are concerned will be discussed more fully in the "Psychology of Advertising." So will the various instincts and interests which may be appealed to most effectively in selling various things. See also the adapting of the selling appeal to the existing form of the interest.

SUGGESTION AND IMITATION

In the broadest meaning of the term, suggestion is the process by which a person is caused to experience an emotional state, to accept a proposition as true, or to perform an act, without giving adequately deliberate consideration to the grounds, or reasons, or evidence for or against the suggested act, feeling, or opinion thus accepted. Such a suggestion may come from the words, or expression, or acts of another person, or persons, or from material things.

Suggestion in the above sense may be known as hetero-suggestion to distinguish it from auto-suggestion. Auto-suggestion is the process by which one influences the physiological processes of his own body, or his own feelings, ideas, or volitions. Some of the applications of auto-suggestion will be made clear in the chapter entitled "Developing Character and Personality." Auto-suggestion and hetero-suggestion are both discussed more fully in the author's "Psychology for Business Efficiency."

The suggestion we are here concerned with is hetero-suggestion. The prefix "hetero" will be omitted in accordance with the general usage.

The acceptance of a suggestion is technically known as imitation. Suggestion and imitation are two aspects of the same process.

In studying suggestion, attention is directed to the characteristics or qualities which fit the stimuli to bring about the result. One also studies the processes in accordance with which the stimuli work in bringing about the result.

In studying imitation one analyzes the processes taking place in the mind of the one influenced by the suggestion. He considers the qualities or traits of character that determine the sort of imitative activity which results from the suggestion.

In order to use suggestion effectively in practical salesmanship one must understand the instincts, interests, habits and other mental processes of the customer, and must select appropriate suggestions and employ them in such a way that they will bring about the desired results.

The following discussion considers the problem of putting to practical use the suggestive-imitative process, in which the salesman employing his selling talk, solicitation, or appeal as a suggestive force, endeavors to secure the imitative response which takes the form of making the purchase.

It must be borne in mind that the term imitation is used here in the technical sense explained above. In this sense, imitative acts include all acts that are performed without giving, before their performance, adequately deliberate consideration to the reasons for or against the performance. Imitation includes all acts performed as the result of an appeal, excepting such as result from fully reasoned

choice or demonstrated truth. One might be said to be "suggestioned" into doing such acts, if our language permitted such a term. In the absence of a more appropriate term, the word "imitative" must be used in a technical sense to describe such acts.

The imitation which follows suggestion is usually not an exact copy, or replica, of the mental state or action imitated. Generally the response to the suggestion is modified or determined to some extent by the native or acquired predispositions of the one "suggestioned." Some element of self-expression usually appears in the imitation.

Imitation and suggestion have been treated more fully in "Psychology for Business Efficiency." See also the subjects "Fashion" and "Fads" in that work.

FACTORS OF SUGGESTIBILITY

When the idea of doing a thing to which one is predisposed by instinct, or interest, or habit, gets into mind so that the attention is centered upon it the actual doing of the thing tends to follow as a matter of course, unless the act is prevented, or as it is technically described, is inhibited by another idea obtruding itself on the attention.

If one is offered something to eat between meals when he is hungry, he experiences an impulse to accept it. However, if it occurs to him that eating the proffered food will spoil a good dinner coming later, or will cause indigestion, the idea of the undesirable

consequences of the act will hold in check, or inhibit, the strong impulse to eat.

The awareness of a situation which concerns the satisfaction of our instincts, or interests favorably or unfavorably, tends to bring about behaviour adapted to deal satisfactorily with the situation. Capabilities acquired innately and developed by experience come into play. The situation is handled as native and acquired aptitude have fitted us to deal with it. Responses have become largely habitual.

The feelings and emotions manifested in the behaviour of others arouse similar emotional states in those who observe this behaviour. Fear and joy and sorrow are thus aroused by suggestion. In this way the confidence, enthusiasm, and good will animating a salesman are manifested in his behaviour, and tend to arouse like states of mind in the man whom he is soliciting.

One who closely watches the acts another is performing will tend to perform similar acts. One person on the street looking up will cause many others to look up. The idea of the act tends to pass over into the performance of the act.

We are all influenced by the volitional aims manifested by those around us. The direct command and the obedience to the command is an illustration. So also the suggestion to any line of action as desired and the compliance with the suggestion. In such suggestion and compliance the instinct of self-assertion is manifested in the one

who makes the suggestion, while the instinct of self-subjection is manifested in the acceptance of or submission to the suggestion.

If the one making the suggestion is looked upon as having prestige or authority, that fact tends to bring about compliance with the suggestion. The impulse of self-subjection is aroused. A state of increased suggestibility is induced. This state is aroused by those who make an impression of having power, wealth, great physical strength, large size, social standing, expertness, etc. A similar effect is produced by a reputation for intellectual superiority, or for great skill in any line, or even by the mere fact that fine clothes are worn.

Anything giving the impression that the one making the suggestion desires to promote the well-being of the one to whom it is made, tends to secure compliance with the suggestion. Anything which gives the impression that the maker of the suggestion aims to further his own selfish ends, leads the recipient of the suggestion to resent it and to refuse to carry it out. In this case the suggestion arouses the instinct of self-assertion.

Qualities which tend to promote well-being are called positive. Qualities which hinder well-being are called negative. The manifestation of positive qualities of character gives effectiveness to the appeal, and vice versa.

Certain things were mentioned above as factors which arouse the instinct of self-subjection and in-

crease suggestibility. When the opposites of these factors are manifested, they arouse the instinct of self-assertion and decrease suggestibility.

Any state which prevents opposing ideas from being aroused through association tends to increase suggestibility. It is greatly heightened in hypnosis. Fatigue, sleepiness, and ill health would thus tend to increase suggestibility along certain lines. However, they bring on a state of general inertia which makes it difficult to influence one along most lines. The consciousness that one is not in a fit condition to deal satisfactorily with the situation may arouse an impulse to contra-imitation, or to act in a way contrary to the one desired.

Deficiency in knowledge, and lack of organization of knowledge in regard to matters involved in responding to the appeal, are factors which prevent the reproduction of inhibiting ideas through association. Hence, deficiency of knowledge, or lack of organization of knowledge, will make one more likely to be influenced by the suggestion. Stock in doubtful mining ventures is sold, not to experts in mining, but to those who know nothing about the business.

For a similar reason one is inclined to act on an appeal along the line of a strong desire. One who is sick can be easily induced to buy patent medicines. Members of one party are inclined to accept, without much evidence to support it, a story reflecting on the opposition party.

In the appeal of the salesman, several varieties of

suggestion may be co-operating to bring about the response of the man whom he is soliciting. A discussion of some of the more important will follow.

SUBCONSCIOUS IMITATION

The customer may be influenced to action by unconscious or unintentional imitation through contagion by direct suggestion. Such subconscious or unintentional imitation is brought about mainly by the effect of the suggestion on the dimly conscious marginal processes known as the subconsciousness. The suggestion produces its imitative response through the impression it makes on marginal consciousness, while the focal consciousness, which is a large factor in controlling action, is occupied with other things. This form of suggestion arouses impulses and activities which seem to be self-originated. In determining the response to the appeal they co-operate with the desires and purposes springing from the conscious deliberative processes.

Through subconscious imitation one may absorb the ideas and feelings and copy the acts of others when he has no intention or purpose of doing so, or even contrary to his express purpose to refrain from doing so. A northerner living in the south may thus unconsciously catch the southern drawl, or the southern attitude toward the negroes. We may cough, sneeze, or laugh, or yawn merely because someone else does so in our presence, or suggests it by something he says.

When those around us are depressed, discon-

tented, irritable, or pessimistic we tend to have a like feeling. When we are mingling with happy or optimistic people, the world looks brighter to us. This sort of suggestion is often conveyed by very subtle or intangible means, such as the general tone of speaking, the bearing, the expression of the features, etc.

Through this form of imitation, the emotional state of the salesman tends to inspire a like state in the mind of those with whom he is dealing. Hence, the salesman should cultivate the habit of looking on the bright side of things. He should fill his mind with optimistic thoughts. One who appears happy and confident will tend to arouse a similar state of mind in those with whom he is dealing. He will thus favorably dispose them to the acceptance of his proposition.

In many instances the customer will respond more readily to the suggestive influences of the feelings and impulses manifested by the salesman, than he will to the reasoning of the solicitation. Feelings and impulses are directly contagious by sympathetic induction. Through subconscious induction feelings and impulses lead to subconscious imitation. The customer comes to feel a strong impulse to respond favorably to the solicitation. The impulse has been suggested so subtly that he feels it to be self-originated. Closing seems to be an act of spontaneity rather than one of self-subjection to the solicitation of the salesman.

This gives a clew to the type of man who will make the most successful salesman. The salesman who is animated by strong feelings and impulses will be much more successful than the coldly logical man, other qualifications being equal. The mere energy or industry of such a man will not make up entirely for the lack of "pep" or fire of the other sort. Of course, the feelings and impulses must be of the right sort. The salesman should be animated with the spirit of service to the well-being of the customer, rather than with a selfish desire to secure a profit from the sale, regardless of the interests of the customer, or with fear lest the customer may escape without buying.

This sort of suggestion is made partly through the tone of voice, which of course appeals to the ear. The choice and arrangement of words, the attitude or bearing, the gestures, the expression of the face, and the general appearance and behaviour of the salesman have strong suggestive force. Most of the last-mentioned factors, of course, appeal to the eye.

The salesman should take a position so that these sugestive factors can be clearly seen by the man whom he is soliciting. The salesman who retires into the shadow overlooks the fact that a great part of the suggestive force, exerted unconsciously during the solicitation, must make its appeal through the eye of the prospect.

The more clearly the man solicited can see the

salesman, the more he will be influenced by the visible manifestations of magnetic, strong, authoritative, efficient personality. Through such visible influences the salesman can inspire belief in his honesty, good will, and desire to serve. He can thus transmit to his customer his enthusiasm and the confidence he feels in his line. These subconscious suggestions accompanying the selling talk may be regarded as a by-product of the solicitation, but they are very important factors in getting the desired result.

The man who is being solicited should be able to see clearly the suggestions made by the salesman, which appeal only to the eye. However, his attention should not be centered on them, but on the selling talk, and on the sample, or the article, or the demonstration of what is being sold.

The man to whom the selling appeal is being made will unconsciously, in his bearing and expression, make suggestions which reveal the sort of an impression the solicitation is making on him. Hence, he should be seated in plain view of the salesman.

CONSCIOUS OR INTENTIONAL BUT UNREASONED IMITATION

This form of imitation is not necessarily unreasonable. As a matter of fact, the acts to which it leads are generally quite reasonable. They do not spring from a process of reasoning, but they can generally be justified by a process of reasoning. The acts thus performed come under the head of ideo-motor activity. Some instinct, or interest, or desire, is aroused by suggestion. The impulse to action accompanying it, is in the focus of consciousness, and tends to pass over into the appropriate act. The suggestion is made without a supporting reason. If it secures and holds the attention, so that inhibiting ideas are prevented from occurring, it will be carried out into action.

Sometimes a suggestion of this class takes the form of a direct command. It may be made by anything which arouses directly an impulse to action. It is then an appeal. The suggestions a salesman makes in his efforts to close the sale are often of this type.

In many of the simpler forms of salesmanship the salesman relies upon a direct suggestion for which he gives no supporting reason. The huckster cries Apples! Apples! The newsboy yells the name of his paper. Each in this case relies on an associative

process to arouse an impulse to buy in the mind of the hearer. If a huckster calls out an attractive quality of his wares, he attempts to arouse the impulse to buy through a direct suggestion which creates desire.

The newsboy attempts to arouse desire and impulse to buy when he calls "All about the suicide!" He uses a suggestion aimed directly at the impulse to buy, rather than one intended to arouse desire, when he says, "Buy a Daily News." This direct command tends to arouse the instinct of self-subjection to the will of another. This merely means an impulse to comply with the expressed volition of another. Sometimes the newsboy uses still another direct suggestion as a closing feature, when he tries to put the paper in the hands of a passerby.

Things to eat, drink, or wear can often be sold without employing an appeal which arouses complicated processes of reasoning in the mind of the buyer. The salesman's task is merely to impress the attractive qualities on the mind of the customer by display and description. The clear perception of the attractive features is sufficient to arouse the impulse to buy.

The salesman often employs this type of suggestion without realizing the effect he is producing. The clerk frequently spoils an opportunity to make additional sales by asking "Is this all?" It wouldn't be much worse to ask "This is all today, isn't it?"

The clerk who asks "Is there anything else you would like to look at?" doesn't do much better.

As he closes one sale, a salesman can often lead to another by making a definite suggestion of some appropriate and particularly attractive article. For example, a clerk who has just sold a shirt could say "We have just gotten in a very attractive lot of ties. How do you like this one?" as he tactfully places before the customer a becoming tie. He thus secures an opportunity to demonstrate the attractiveness of the tie and to tell about its excellent quality and stylishness. In doing so, he will be making rational suggestions, which will be considered later.

Suggestions of this sort that are potent and far-reaching in their consequences can be made in subtle ways of which one is not fully conscious at the time. How would it affect the amount of business done on credit if the salesman regularly asked "Will you have this charged?" Consider the effect on the delivery charges of a clerk taking one of the following courses: First, suppose he asks "Will you have this sent out?" The average customer would consider the question an invitation to have the thing sent out and would answer, "Yes," though, of course, some would say "It will give me no bother. I may as well take it." Again, suppose the clerk says "Will you take this with you?" Many would say yes, and would take it, though some would ask to have it delivered. The question in the latter form might do much to reduce delivery charges, though a few might resent it

as implying that the store is unwilling to deliver. If the package is one that can be carried conveniently, the best course would be for the clerk, as he thanks the customer, to hand him the package, as if he would take it as a matter of course.

Very frequently a mere suggestion will be more effective than a fully stated reason. Suppose the salesman is trying to induce a merchant to take the exclusive sale for a line. He may say, "Here is a thing which offers such and such an opportunity in your line. (Of course he would make his claims definite.) Any live dealer like you can make a great thing out of it." Some such suggestion would be more effective than to say right out, "If you don't take this, I will sell it to one of your competitors and he will secure a great advantage over you." The salesman should not make statements that may be regarded as suggesting or implying a threat. Such statements arouse a feeling of hostility.

We have been discussing the selling appeal which consists of a direct sugestion for which no supporting reason is given. It should be apparent by this time that this type of sugestion plays a large part in more complex selling appeals. This type of suggestion merges without a sharp dividing line into the type of suggestion supported by an explicitly given reason, or reasons. There is, in turn, no clearly defined boundary line between this type of appeal and the one which aims at bringing about a fully reasoned choice.

As a rule, a salesman can not make a sale by bringing about an unreflecting response to a suggestion. He generally arouses deliberative processes and encounters objections which must be overcome.

FULLY REASONED CHOICE AND DEMONSTRATED TRUTH

Under this heading comes the selling appeal which seeks to make the sale by a clear and forceful appeal to the intelligence and judgment. The salesman aims to guide the customer through a thorough consideration of the reasons for and against buying. The desire to make the purchase is to spring from adequate investigation and deliberation.

The salesman may undertake to make the sale by demonstrating the truthfulness of his claim in regard to the value of the thing he is selling, by putting the matter to the test of actual experience. By trying it out, one could thus prove that a machine can be used profitably in a certain business.

On the other hand, by considering the reasons for and against it, one may be led to the conclusion that a machine can be used advantageously. Or he may reach the same conclusion by reasoning from the experience of others in lines of business similar to his own.

In some instances the salesman can employ both logical exposition and experimental demonstration to establish the desirability of the thing he is selling. However, he rarely endeavors to conduct the customer through a consideration of all the reasons for and against the purchase. In practice he usu-

ally gives consideration only to such reasons against the purchase as are brought up by the customer.

The salesman should never undertake to make a sale when he believes there are valid objections which would make it unwise for the man to buy. He may refrain from mentioning objections which do not occur to the customer, provided he is fully assured that it will, on the whole, be to the advantage of the customer to make the purchase. In most instances, fully reasoned choice is merely an ideal to which the selling appeal aims to approximate more or less closely. This approximation takes the form of rational suggestion, which we consider next.

RATIONAL SUGGESTION AND RATIONAL IMITATION

One can rarely be absolutely sure of the correctness of even his most carefully formed opinions about the things he buys. Deliberate consideration of all the reasons for and against and demonstrably certain truth are merely ideals to which the selling talk approximates more or less closely. This approximation takes the form of a response to one of the varieties of rational suggestion. As the appeal, from the view point of the salesman, is a process of rational suggestion, so it is a process of rational imitation from the point of view of the man whom the salesman is soliciting.

Sometimes it is more effective to merely suggest the reason which will give rise to the impulse to purchase, than it is to state it explicitly. The impulse to purchase will then seem to be spontaneous or self-originated. Carrying out the impulse will then seem to be a matter of self-assertion rather than a case of subjection of self to the will of another. The following are illustrations of suggestions of this sort. "The oldest house in America." "The largest business in this line." "We make articles for the United States government." A different impulse is aroused by the following: "Makers to the king." "Made in Paris." Figurative language, if

skilfully employed, is very effective in arousing impulses to action. Examples of this are "The key to success," "The highway to prosperity," "The road to happiness."

The use of suggestions which become effective only through the working of the associative processes of the mind will be discussed more fully in "The Psychology of Advertising."

It may be well here to caution the salesman against the use of bombast or over statement. Claiming too much arouses suspicion.

RATIONAL SUGGESTION

As was seen before, in some instances the sale may be brought about by employing mere suggestion. In such a solicitation there is no attempt to arouse deliberative processes and through them to create desire. Suggestion may lead to the acceptance of claims to desirability, with full conviction of their validity, without arousing a complicated and exhaustive deliberative process in the mind of the customer. Suggestions belonging to the first two classes may have an important effect in bringing about the act of closing, and in the solicitation leading up to that act.

The ordinary selling appeal consists of suggestions which become effective without the help of logical processes in the mind of the purchaser, and also of suggestions which rely on the co-operation of logical processes to make them effective. It is also true, in a very large number of cases that the sug-

gestions play a more important part than the logical processes in making the sale. To make suggestions effective, avoid vague abstractions. Make specific statements. Employ definite and concrete ideas. See that they are clearly apprehended.

In one type of rational suggestion, in order to reinforce the impulses aroused by reasons why, a suggestion is made which aims directly to arouse an impulse to perform the act of purchasing and to make it pass over into action. Previously to the making of this suggestion, the salesman has made an effort to predispose, or incline, the mind of the customer to a favorable response to the suggestion. By giving reasons why, or by quoting authorities, he endeavors to create in the mind of the customer an attitude which will make him receive the suggestion favorably. A suggestion is then made to bring about the act of closing, to which the other suggestions predispose one.

If a suggestion is clearly and strongly made and opposing ideas are not present in mind, the impulse aroused by the suggestion will follow its natural tendency to pass over into action. The tendency to bring about compliance is strongest, if the suggestion arouse desire, or if it is directed along the line to which habit or instinct inclines. The response to the suggestion will then be purely impulsive in character and will be performed without ulterior reason or purpose for doing it. It is not founded on, or supported by reason why, or proof, or logical

conviction. This type of suggestion was previously discussed.

The suggested act will be more likely to be performed if it is made to seem reasonable, and if it is in harmony with the controlling purpose dominant in the background of consciousness. In many cases, it is not necessary to get the customer to perform an elaborate process of reasoning to prepare his mind so that the suggestion will seem reasonable to him when it is made. For example, a man was desirous of buying a machine to do a certain work. The salesman mentioned a few places where the machines were being used satisfactorily. The prospective purchaser knew the people using them and believed that they would be satisfied with nothing less than first class results. He closed the deal without going into an elaborate consideration of the comparative merits of the machine. The purchaser simply followed the leadership of those who had prestige in that particular line.

In most cases the salesman must indicate the value giving qualities of the article. He must then explain, in such a way as to suggest belief, the main reasons why these qualities give value to the article.

Men do not often reason exhaustively about a thing. The salesman should not lead the customer to deliberately weigh all the reasons, for and against, which can be found.

The successful salesman holds the attention and so directs it that no competing or inhibiting idea arises with strength enough to prevent the sugges-

tions he makes from controlling action. Men tend to accept statements made confidently and authoritatively. The reasons why, given by the salesman, will be held to be true, unless some contradictory idea occurs to prevent belief. The salesman who arouses and maintains a lively interest in his selling talk will do much to prevent such ideas from occurring. He should keep competing lines, and reasons why not, out of the mind of his customer as far as he can. By giving reasons why, and omitting reasons why not, the salesman can often induce the customer to make up his mind to purchase, without encountering serious objections to so doing.

A suggestion, contrary to the purpose dominant in consciousness at the time the suggestion is made, may be performed, if it centers attention on its self so strongly that the dominant idea lapses from consciousness. A suggestion which arouses strong feeling or emotion may thus center attention on itself.

A suggestion is more effective, if it is bolstered up with a background or fringe of ideas arousing impulses tending to reinforce it. That means that the suggestion which is the focal element will be more effective, if the ideas which have recently been in consciousness, or are still in the margin of consciousness, are of such a character that they arouse impulses to action harmonious with the focal suggestion. How this may be brought about will be explained later.

Men are inclined to act on suggestions in regard to subjects about which they know little, as reasons

why the act should not be performed are not likely to occur. They follow the advice of the expert, without demanding proof, in matters concerning which they are ignorant. The man, who can give the impression that he is an expert, can readily impose on the ignorant. Stock in blue sky mining companies is sold to people who know nothing about mining, not to the experienced miners.

Selling to an expert is a different proposition from selling to an experienced buyer. One requires cogent proof before he is willing to act on a new proposition concerning matters with which he is familiar and to which he has given much thought.

The force of habit makes men shy from a proposition which resuires a readjustment or rearrangement of their familiar notions, beliefs, or habits. More than mere suggestion is required to get a man out of a rut which is leading him the wrong way. Care must be taken to make the amount of such readjustment seem as small as possible. The proposition should be presented, as nearly as may be, as offering a better means of attaining an end already recognized as desired.

A suggestion not to do a thing has little, if any, negative force. Such a suggestion merely keeps the attention fixed on doing the prohibited thing. To prevent the carrying out of an impulse to action, the idea of a course of action contrary to the impulse must be present in the mind. The word "not", in a command, does not arouse an impulse to act in an opposite way. To prevent the carrying out

of an action, it is necessary to suggest an opposing or inhibiting course of action in such a way that the attention is fixed on the idea that arouses the inhibiting impulse. To do this, one should awaken an opposing motive to action.

Some men naturally tend to do the opposite of the thing suggested. They manifest the trait known as negative suggestibility. One can almost get them to do a thing by suggesting that they do not do it. About the only way to handle such men successfully is to handle them so tactfully that they will think that they themselves suggested what you wish them to do.

If a man is ill-tempered, troubled, distressed, worried, or pessimistic, the salesman should get him into a more favorable state of mind, or wait until a more opportune time to press his business. Men are likely to be inclined to buy less freely on a day which is unpleasantly windy, or rainy or snowy, or hot, or cold. Success in selling will be affected adversely by the ill health of the customer, his state of hunger, fatigue, discomfort etc. All of these conditions will tend to affect the efficiency of the salesman, also.

Pleasure renders a man more optimistic, gives him more confidence in his own judgment, and renders him more easily influenced by suggestion and likely to buy more quickly and in larger amount. Hence the salesman should try to create a pleasurable state of mind in his customer. He should not inhibting impulse. To do this one should awaken

resort to obvious flattering or jollying. These are likely to arouse offense.

To create a pleasurable state of mind in the customer, the salesman should depend upon a pleasant manner of approach and upon saying in an agreeable way the things he will enjoy hearing. Be optimistic about the prospects for business. Find some feature of his business establishment or something in his method of merchandising that is deserving of praise. Express your commendation sincerely and heartily. Create a feeling of confidence in your judgment and business sagacity. Make him realize that you are really desirous of doing what will be for his best interests.

In dealing with an experienced business man, it is well to come right to the point, and without waste of time to present a proposition which is boiled down and full of concentrated force.

In dealing with people not used to doing business in a business like way, the salesman may find it well to indulge in a little preliminary talk to permit the prospect to get acquainted with him and cause him to feel confidence in him. He may tell a funny story to get the customer to laugh with him. In this preliminary talk he can show interest in the business, or the family, or the outside concerns or hobbies of the customer. He can tell him of long continued business relations with others whom he may know, of recent business done, etc., to show that others have satisfactory business relations with the firm. He can make clear to the customer

that he has a good knowledge of business conditions and prospects, and that he has a mastery of successful ways of merchandising that will help the man in his business, etc.

Adapting the appeal and the solicitation to the various interests as they are found to exist in those who make up the market will be discussed more fully in the "Psychology of Advertising."

INCREASING THE EFFICIENCY OF THE SELLING FORCE

One of the most important duties of the sales manager is to keep enthusiasm alive in his sales-force. One can be enthusiastic over a line, only when he understands its importance. Enthusiasm in a salesman is like steam in an engine. It furnishes motive power. Enthusiasm is contagious through suggestion. It oozes out in all that the enthusiastic man says and does. Its manifestation in subtle ways, in the tone of voice, gesture, expression and bearing of the salesman, arouses a like state in the mind of the customer. In religion, many men are converted more through feeling than through reasoning. Feeling has a like potency in business. A selling talk charged with good will, optimism, confidence, and enthusiasm, will accomplish what cold reasoning alone can never gain. A man's belief that the man he is soliciting will make the purchase, may manifest itself in the subtle ways explained previously and become a potent factor in making the sale.

The salesman occupies an important position in the affairs of the business world. He renders an indispensable service. He has reason for self-respect, if he has prepared himself to perform efficiently the function of his calling. If he can not be

enthusiastic about the line he is selling, he had better quit it and get one he believes in, if he wishes to gain the success his ability fits him to attain.

The salesman should be given a message of good cheer and encouragement when things are not going well with him. Hauling a man over the coals, or threatening to discharge him, does not put him in a state of mind which fits him to do good work.

Credit for success achieved should be given heartily and generously. Recognition, by way of public mention and commendation of specially meritorious achievements, inspires ambition in the one so distinguished. It is also a suggestion that is potent to stimulate others to emulate the worthy act.

The sales manager who renders best service to his salesmen will be most effective in inspiring the salesmen to render efficient service.

CONVENTION OF SALESMEN

Getting the salesmen together for conference and instruction is an excellent means of improving their work. The program may include the demonstration by an expert of the best method of making a sale, of instructional and inspirational addresses etc. It will probably include a round table conference in which the salesmen exchange their views on various problems involved in selling. This develops a spirit of co-operation.

Each man is likely to put forth his best qualities in such a gathering and will take pride in making clear the things which have contributed to his suc-

cess. The results attained by the more successful inspire the others to resolve to rival their achievements.

The suggestions received by each man from many sources jar him out of his ruts. He will set himself to examining critically his own successes and failures, as he hears the successes and failures of others discussed. He will acquire new ideas and will improve his methods of working.

The spirit of competing with other members of the selling force will stimulate the men to put forth greater energy and to initiate new lines of effort. To make the most of what is gained in such a convention, the sales manager must devise ways to keep this spirit alive, while the men are working separately. This can be done by keeping them informed about trade conditions and prospects. They should be told about the success of other salesmen, and how it was gained.

SALES CONTEST

Experience gained in a great variety of lines has demonstrated that a well managed sales contest is a very effective means of increasing business. The potency of the contest is easily explained. It stimulates into activity many of the strongest instincts and interests.

Among the instincts aroused by the contest are the following:—Rivalry, emulation, self-assertion, desire for approbation, fighting, acquisitiveness, cooperation with others, and loyalty to group inter-

ests. Of course some of these are active in the form of the interests developed from them. For example, the contest awakens the wealth, the vocational, the sociability, and the moral interests.

AWAKENING INSTINCTS AND INTERESTS RENDERS MORE ENERGY AVAILABLE

When an instinct or an interest is aroused the activity of certain physiological organs is correspondingly increased. The increased activity of these organs renders a greater amount of energy available for carrying out the impulses which have been aroused.

For example, the suprarenal capsules are small glands above the kidneys which secrete adrenalin and pour it into the blood. When the fighting and emulative impulses are aroused there is an increase in the amount of adrenalin secreted.

The increased amount of adrenalin in the blood stimulates the liver to give over to the blood some of the energy stored up in the liver in the form of sugar. Thus energy is furnished to maintain the increased activity of the various organs of the body involved in carrying out the fighting and emulative impulses. The increased supply of adrenalin also tends to prevent the inhibiting sensation of fatigue from becoming strong enough to check the action before the available supply of energy is used up.

In order that a sales contest may be carried on successfully, means must be employed to stimulate

effectively some, or all, of the instincts or interests previously mentioned.

The instinct of rivalry is usually appealed to by offering a prize. In order that the prize may serve to stimulate all the salesmen equally, it is necessary to fix upon a fair basis for measuring achievement. A careful investigation is made to determine the amount of sales which may be justly expected from each salesman under the conditions prevailing, making no allowance for the stimulating effect of the contest. In a recent contest, credit was given as follows on a 100 per cent basis: 20 per cent was given for the exemplification of real salesmanship, 20 per cent for the greatest volume of sales at a reasonable profit, 20 per cent for the best percentage of profit on a reasonable volume of sales, 10 per cent for the largest increase of old accounts, 10 per cent for the smallest volume of rejection and the least supervision necessary from the general sales offices, 10 per cent for the smallest volume of losses, 10 per cent for the greatest increase in permanent new accounts. A definite quota is assigned to each salesman. The prize is to be given to the one who makes the greatest percentage of increase in his quota. Each salesman is kept informed as to what all the others are doing.

If the prize is considerable in amount, it will appeal to the wealth interests.

Making the achievements of each salesman known to all the others, also arouses the spirit of rivalry.

It also stimulates the sociability interest, as it makes each put forth his best efforts in order that he may stand well with others. It says to him, in effect: "The world has no use for quitters and failures. Here is a race open to all, and no favoritism is shown. The best man will win. Are you the best man?"

A similar appeal may be combined with an appeal to the sociability interest, the spirit of co-operation, and of loyalty to the business. "You have been selected as a member of this selling organization because you have shown that you have ability, industry, and high business ideals. You have helped to make this business what it is. Will you help to make it better?"

In order that the sales contest may be a success, appeals must be directed definitely and effectively to certain specific instincts and interests. If instincts and interests are awakened to activity along the right lines, the fund of energy at the disposal of the salesmen will be greatly increased. Their feelings will be kindled. Their minds will work more actively. Effort will be concentrated on the things that count.

DEVELOPING CHARACTER AND PERSONALITY

SUCCESS DEPENDS UPON CHARACTER

The efficiency of a man in any line of business depends in large measure on the character he has formed. From his character come his strength and skill in influencing men and the respect he is able to inspire in the men with whom he comes in contact. The factors which are effective in inspiring respect are traits of character manifesting themselves in subtle, almost indescribable ways, in expression, words, tone, and acts. Through suggestion, one's character impresses itself on others, whether he wishes it or not. Holding the good will of people with whom one does business depends largely upon the treatment accorded them. The treatment will be as the character is. The character can not be bad and the acts regularly good. Good character is manifested in habitually according the right treatment to others.

Character grows out of the native tendencies and impulses, the instincts and interests, which we have already discussed, as they are developed into habits by the material and social environment. The objects to which our native impulses attach themselves, and the form which their development takes, depends upon educational influences, taking them in the

broad sense which includes all external influences which affect our life.

A man stamps his true value on himself. Hence, he must be what he wishes men to take him to be. No mask, or make-up, or attempt to play a part, will long prevent the inner man from impressing itself, through suggestion, on those with whom we deal. The world will take a man at the value he places on himself, provided he is not trying to float a lot of watered stock. One should strive rigorously and unflinchingly to be and do the things he ought to be and do.

Preparation for business efficiency consists in large part of developing character and personality.

Psychology is merely a descriptive science. It is interested solely in telling how the mind works and how character is developed. As a science, it has no concern to decide whether any particular habit is good or bad. To find out what traits of character are desirable, we must consult the conscience of the individual, the experience of society, educational theory, ethics, and religion. In the last analysis it will be found that the so-called bad acts are tabooed because they bring bad results. The good traits of character are so considered and esteemed because they further individual and social welfare. The best traits of character are the traits which make for the highest success.

Among the good traits of character are: honesty, industry, care of bodily well-being, cleanliness, per-

severance, thoroughness, punctuality, ambition, open-mindedness, thinking for one's self, progressive spirit, leadership, confidence, courage, cheerfulness, optimism, self-control, temperance, truthfulness, obedience, courtesy, sympathy, civility, loyalty, etc. The reader can add to this list as he pleases. A little reflection will convince him that he would regard none of the virtues as traits or elements of character, unless they were habitually manifested in conduct.

To find the strong and weak points in one's character requires careful and honest self-criticism. Much will be revealed in the advice of friends, the criticism of enemies, the treatment one receives from business associates, and one's success in dealing with others. In forming his character, one should be guided by the ideal of self-realization previously discussed. He should aim at an harmonious development of character and efficiency in all lines, with special attention to the matter with which he is most concerned.

Since a man's character is made up of native impulses developed into habits of thinking, feeling, and willing, the form that his character takes is to a large extent under his control. One can change his character by changing his habits. To give up old habits and form new ones, one must resolutely refuse to yield to the tendency to act in accordance with the old habit. Just as resolutely, and unhesitatingly, and invariably, he must improve every opportunity to act along the line of the new habit he desires to form.

This is so difficult that it is necessary to get the strongest possible hold on one's self at the start. But it grows much easier to act in the new way, as time elapses and the habit gets better formed. The new way, which at first required painful effort, later becomes pleasurable. It will finally require effort to act contrary to the new habit.

The most difficult thing in forming a new habit is to get strength and resolution enough to jerk one's self out of the old rut and get a good start in forming a new one. In time the habits will become a second nature, stronger than the original nature. Do not concern yourself with the undesirable habit you wish to eliminate from your character further than to refuse to give attention to the impulse to act along that line, or to allow the impulse to pass out into action.

SELF-CONFIDENCE

To make it clear how one can develop the more complex traits of character, and attitude of mind, let us consider self-confidence, which is of the utmost importance in every line of work. A firm spirit, manifested in confident and self-reliant attitude and in decisive action, compels respectful, and even considerate treatment from others. Show fear and you invite others to impose on you. There is much truth in the saying that men can win because they believe they can win. Energy in action follows naturally from self-confidence. To develop the self-confident feeling and bearing, decide carefully what you wish

to do and how to do it. Be thorough and painstaking in your preparation. Keep your purpose in view. Be on the alert for new points of view, new ideas, and new light on old ideas. You will thus acquire a fund of ideas and experience which will make you master of your line.

Give yourself good reason to think well of yourself, and then think well of yourself. You will thus develop self-confidence and initiative. Then do not stand around hesitating and irresolute. Go to work with an energy that never falters or turns aside.

Where there is a will there is a way.

Don't harbor feelings of doubt, or dwell on thoughts of inefficiency and failure. Most fears are groundless. Still more are worse than useless. By dreading a thing, you will be likely to contribute to bringing it to pass, and you will certainly increase its ill effects when it comes. Do not let your thoughts dwell on your shortcomings or chances of failure. A difficult situation once squarely faced loses most of its terror.

Overcome any tendency to diffidence or self-distrust by keeping your thoughts fixed on what you have to do, not on yourself. Keep before you the advantage and satisfaction which will come from succeeding. Study your failures only to find out how you can increase your proficiency, and then forget them. Think, instead, of future successes. Suggest to yourself frequently, "I am able to succeed. I will be self-confident. I will succeed."

To impress your self-confidence on others, manifest in your work, optimism, courage, confidence in your ability to succeed, intense earnestness, enthusiasm, and perseverance. Work without hesitation, in a thorough and honest manner. Avoid over-tension and convulsive efforts, as they manifest weakness and involve waste of energy. Give the impression of having plenty of time to accomplish your work. Appear confident of being able to handle the situation satisfactorily.

If you wish to be a successful man, you must assume the mental attitude and manner and bearing of a successful man. The successful leader of men shows self-reliance and conscious power in his manner, conversation, and carriage. He impresses men as believing in his ability to do great things. Men have confidence in one who believes in his own ability. They distrust one who lacks confidence in his own powers to secure good results.

PERSONAL MAGNETISM

This quality is so complex in its character as almost to defy analysis and explanation. The person who is described as possessed of magnetism will be found to manifest many of the following traits. He dresses tastefully in good clothes, well-pressed and cleaned, well-kept shoes and clean linen. He is well-shaved and bathed, and well-groomed. He speaks distinctly with a pleasant and well-modulated voice. His gestures and bearing are pleasing. He shows

courtesy and politeness by doing what is generally recognized as good form. He has consideration for others, and interest in their welfare, and in what they do and say. He has tact and avoids over-familiarity and weak flattery. He is cheerful, and cultivates the art of pleasing. He does the right thing, in the right way, and at the right time. He has easy confidence in himself, but is not conceited. He appears successful, shows mastery of his business and enthusiasm for it. At the same time he is interested in many other subjects, and well informed about them.

Human Nature
How Business Makes it Pay

CHAPTER I

THE LAW OF AVERAGES

HUMAN beings, when you average them up, are surprisingly alike. And human impulses are a fairly constant quantity. If an Average Man does one thing to-day and something else week after next, it is not necessarily because *he* has changed, but probably because there has been some kind of shift in conditions. As Robert W. Service observes:

> The thistledown that flits and flies
> Could drift no hair-breadth otherwise.

That is, the thistledown blows just the way it does because of the various physical conditions that control it—the topography of the earth, the altitude, barometric pressure, temperature, and velocity of the wind. If one were familiar enough with all these factors, and also happened to be clever enough at mathematics, it might be possible

to figure the thing out, and place one's finger on the exact spot where the thistledown eventually would alight. Everything is Cause and Effect!

So it is with people. Equipped with a knowledge of all items entering into the situation, we could forecast precisely how a man would react under a given set of circumstances.

If it should be noted that ten persons a day slip and fall on the pavement in a congested area of a big city, and then some day twenty-five persons should fall, it would not mean that people on the average were becoming less steady on their feet, but more likely that the pavements had become more slippery. A newsboy starts over a route shouting his Sunday papers. He has two hundred papers with him, let us say, and can sell only one hundred and forty. To his disgust he has the rest left on his hands. On the following Sunday, therefore, he buys only one hundred and forty papers. And on that day, perhaps, he could easily have sold two hundred and fifty. He decides that man is an erratic animal about his Sabbath-day reading, and that there is no use trying to predict what he will want. But the chances are that on the day the demand was for two hundred and fifty papers, there was either bad weather to keep men indoors, or something in the papers of greater news importance than on the Sunday previous.

With a record at hand of past performances and all present influences, it should be easier to tell in advance about an average man than about an

average race horse; for, inasmuch as there are more men than race horses, it is possible to get the average a little closer. To know all the motives and whims that enter into the actions of an individual is practically impossible; but when we consider a crowd the task is less difficult. Individual peculiarities average up and are lost sight of in a big mass of persons. And the larger the crowd, the more definitely can we predict what an average person in the crowd will do.

If fifty women walked along a certain street, and one of them paused to tie her shoestring, it would hardly be justifiable to say that one out of fifty, day after day, would do so. But if it were found that ten women out of every one hundred thousand, on that street, fastened their shoestrings, the chances are that about the same proportion would stop to perform the same little chore, on an average, every day in the year.

A definite number of women out of every ten thousand will stop to buy candy, or soda water, or dotted veils. This number may vary according to climate, weather, season, or day of the week; but there will, nevertheless, be a constant relation between the number who buy, and the surrounding influences.

Insurance companies know with uncanny accuracy the average man's chances for a long life or a short one. They know that under certain conditions—age, climate, occupation, and so on—so many men out of every thousand will die before

the end of the year. So many men out of every thousand will be careless and accidentally set their houses on fire. A certain number will run into guileless pedestrians with expensive, high-powered automobiles, and be sued for damages. A known number of automobiles out of every thousand will be stolen every year. And the older the machine the more likely it is to be stolen, even though it is not so valuable, because it is less under the cautious, watchful eye of the owner. Of every thousand barns insured against fire a definite number are sure, as the insurance companies have found out, to be struck by lightning.

If one were to stop a thousand men, at random on the street, and ask them what size shoes they wear—and then go to another street and ask a second thousand men the same question, the chances are that almost exactly the same percentage out of each thousand would be found to have on number nines.

Army quartermasters know that two hundred and thirty men out of every thousand must have their hats size 6⅞, but only one man in a thousand wears size 6½. One man out of every three wears a fifteen collar, but size fourteen does not fit even one man in ten.

Every retail dealer is obliged to depend somewhat on the law of averages. The ready-made clothing dealer knows that there will be a certain number of fat men to be fitted in his establishment for a certain volume of business. If he is selling

hats or shoes, he knows in advance what percentage of his customers will require any one particular size.

Count the number of times the letter E is used in a thousand words in the Bible, and then count that letter in a thousand words in your favorite newspaper, and you will find the number in each place to be substantially the same. This fact is made frequent use of in the translation of secret codes. No matter what letter, or number, or character we decide to use in place of any letter of the alphabet, its real identity may be quickly established simply by counting the number of times it is used.

One often wonders at a hotel clerk when he says: "I have no room for you now, but I can give you something at about half-past eight."

How does he know that there will be a number of four-dollar rooms available a little later? The occupants haven't said they were going away, have they? Unconsciously the clerk utilizes the law of averages. Experience has proved that of each hundred guests in a transient hotel, a fairly definite number of those in four-dollar rooms will check out each evening.

Another striking illustration of the possibilities in harnessing the law of averages may be seen in any big newspaper office on election night. When the returns are in from half a dozen representative precincts,—some in the country, others in the city, —a clever political editor can forecast within a few hundred votes of the plurality in his State

for the winning candidate. He simply makes comparison with the vote in those precincts in previous years. If one third of the people in two country precincts shift from the Republican to the Democratic column, there is a fair chance that about the same proportion of the voters have changed over in the country voting places yet to be heard from.

So it goes. There is almost no limit to the things one could tell accurately in advance about human proclivities, if only one had a detailed record of the past as a basis for such predictions. A concern operating chain stores, with its twelve hundred or more retail establishments, has made a tremendous business success because it is able to tell beforehand just how many men will come into a shop at a given location each day, and how much money they will spend. One man out of every so many passing along the street is certain to stop and buy.

CHAPTER II

THE LITTLE LAW AT WORK

On the morning of April 3, 1917, men smoked more cigars than usual. All that day they smoked more cigars than usual. Tuesday, April 3d, was a record-breaking day for cigar sales all over the country This was all the more surprising when we consider that Tuesday is ordinarily the dullest day of the week for selling cigars. Men stock up Saturday, to make sure of plenty of smokes over Sunday, and they replenish their stock again Monday morning. This supply usually carries them over Tuesday. But Tuesday, April 3d, was different. In New York City, for example, there were vastly more cigars sold than on any other Tuesday in the city's history. I have no doubt that this was true in practically every other American city.

Why were men more inclined to consume cigars on Tuesday, April 3d, than on any other day? Simply because, on the night previous, the President of the United States had appeared before a joint session of the two houses of Congress and delivered a message asking for a declaration of war against Germany. When people read the papers

the next morning it made them extremely thoughtful. It was a day of tenseness. Men were rather unfitted for ordinary business, but were inclined to gather in groups and talk—and smoke. Those who were in the habit of smoking at all smoked that day more than was their custom.

Now the point to all this is that men, in the long run, react about alike. A situation that makes one smoker use up more cigars than usual makes nearly all smokers do the same thing. On the other hand there are conditions that cut down the amount of smoking. A big parade or carnival on the main street of a town always reduces the cigar sales for that day. Men get interested in watching the goings-on about them and forget to smoke.

Not every individual does exactly the same thing under the same circumstances, it is true, but the average man does. In the restaurant of a famous department store in an Eastern city, the manager knows exactly how much food of each kind to prepare, because he has figures at hand to show what the average man has ordered in the past. He knows from previous experience how many people are likely to eat luncheon in the store restaurant on a certain day of the week at a certain season of the year. And he knows that only one person out of every hundred will order shellfish. A trifle more than one out of every five is reasonably sure to desire some kind of salad. Here are the percentages of customers that order various other items:

Relishes	1.7
Soups	6.7
Fish	5.2
Boiled Meats	2.0
Entrées [made dishes]	6.0
Roasts	5.6
Vegetables	7.4
Sandwiches	6.2
Pies, Cakes, and Puddings	14.4
Ice Cream	14.4
Cheese, Crackers, and Beverages	30.5
Cooked to order	5.3
Club Luncheons [75c.]	33.5
Fruit	2.4
Cold Dishes	2.6
Specials for the day	8.8

The list given is the average for both winter and summer. By keeping records of food eaten on different days under various conditions of weather and temperature and general business it would be possible to lay down figures so definite that the chef could look at the sky and the calendar and the thermometer and the newspaper, and cook exactly enough, but no more than enough. Waste is thus eliminated. The old way was to cook up things at random and trust to luck. There was always too much of one article and not enough of another.

Every year business men learn new ways to derive benefits from the law of averages. It is one of the most potent forces in the business world for the cutting out of lost motion. The largest

mail order concern in the world, located in Chicago, can tell within five minutes after a wagon-load of mail has arrived, exactly how much money the mail contains. How? Simply by shoving the mail upon a scales and weighing it. That is where the law of averages is of great assistance. With a knowledge of what has happened in the past, it is possible to tell what will happen again—so far as the daily mail is concerned. A certain percentage of the mail will be mere chaff —inquiries of one kind or another, and circulars. But for every pound there will be a definite number of letters containing money orders; and these will average in the neighborhood of five dollars apiece.

Thus, the company, knowing almost to the penny what the mail has brought, can adjust itself either for a big rush of order-filling, or for a comparatively light day, as the case may be.

The company knows, too, from past experience, just how many orders it should get from each catalogue sent into a State, and it also knows which States excel in the average size of orders. In one State the average order per catalogue is only about $2.50, while in another it is more than $6.

In St. Louis is a famous hardware concern that probably makes more different uses of the law of averages than any other business enterprise in existence. For instance, they take, each day, stacks of little sales slips that come in by mail from men on the road, and weigh them. Then they

know, without further ado, just how much money the sales for that day represent. Each ounce of the little slips means so many dollars. One slip may be for a bill of goods amounting to thousands, and the next may cover only a dime's worth of nails. But a stack of the slips always average a certain amount. It never varies more than a few pennies.

This concern collects facts about various subjects that might seem to have only a scant relation to the hardware business. The reason is that their experience has taught them this great lesson: There is scarcely any fact that cannot be utilized in one's business if one only knows how.

For instance, this company lays great stress on getting all possible information in advance on the political situation. In every presidential campaign for many years back they have invariably known in advance what the result would be. They instruct their salesmen to take a straw vote of all the people they meet. As their salesmen go to the principal cities of every State in the Union they are able to get in touch with a wide range of opinion. Moreover, the people they deal with—hardware merchants—because of the very nature of their business, come in contact mostly with men. A hardware merchant usually can sense the political leaning of his immediate community. The salesmen, meeting the hardware merchants of a whole State, therefore, can arrive pretty definitely at the facts regarding what is going to happen politically in that State.

These reports from salesmen about political conditions are sent to the head office of the big company, where they are handled by only two men, who guard them with the strictest secrecy. While rival concerns are preparing by guesswork to meet after-election conditions this one acts with definite knowledge In 1896, when Bryan ran against McKinley on the free-silver platform, there was uncertainty about what monetary values would be after election, and hardware merchants everywhere allowed their stocks to run down. They did not wish to invest a penny more than was actually necessary in merchandise until they knew whether a dollar was to be worth a dollar or only fifty cents. So effective had been the advertising of the Republican National Committee, however, in associating the election of McKinley with the return of prosperity, that business men agreed on this point: A big buying wave to replenish stocks would sweep the country in the event of Republican success.

Everybody had his opinion, but the big hardware company had more than mere opinion. They knew. They were so certain of McKinley's election that they provided the biggest stock of goods in their history, ready to supply the demands of retailers when the buying wave got under way. Sure enough, after the election was over people began to buy. Prices of raw materials went up. Most wholesalers were unable to make prompt delivery. But the company that had found out

about the election, even before it happened, was ready. They could promise immediate delivery, and they had bought their goods while the articles were still cheap. They had a big advantage over their competitors; and yet the nation-wide poll that gave them this information cost practically nothing, for their men would have been talking politics and learning the same facts anyhow.

This company is equally careful to have its men turn in daily reports of weather—temperature, rainfall, and so on—and also information regarding conditions of crops. They even arrange to get information about the weather in England. And how does English weather enter into the situation? Here is the idea: An unusually warm, rainy spring in England will mean a demand earlier than usual on English manufacturers for pruning shears, scythes, and such articles. This in turn will mean that the manufacturers will be less able than usual to make prompt shipments of such goods to America. Wholesalers in this country, therefore, must either get their orders in early or arrange to get the goods elsewhere.

Likewise a rainy March and April in any section of the United States means that there will be a big demand for haying scythes and sickles and lawn mowers there in June. Under the law of averages a certain number of men out of every thousand who need lawn mowers buy new ones each year. But the number of those who decide to get new ones, instead of making the old ones do, depends

on the luxuriance of the grass. So, too, there is a definite relation between a dry spring and the number of persons who will buy new lengths of garden hose.

Throughout the wheat-growing sections of the Northwest, this hardware company has found, there is an almost exact relation between the size of the wheat crop and the purchasing propensity of the average man on the street. It matters not whether a man in that section is a farmer or a journeyman plumber. He may not know it, but he spends his money according to the amount of wheat his neighbors have in their barns. When the wheat is sold a sum of money is placed in circulation. A certain definite ratio of this money goes to hardware merchants. These merchants, of course, buy new stock according to the amount of business they do. Hence the advantage to a big wholesale-hardware concern of knowing the size of the wheat crop without waiting until it is threshed to find out. They can tell almost to the penny how much they will sell in any small hamlet, as soon as they get enough facts about the weather in that section to enable them to forecast the size of the wheat harvest.

In the Treasury Department at Washington is a man by the name of Joseph S. McCoy, who, though he works in comparative obscurity, is one of the most notably useful men connected with the Government. He deals with statistics, and is by education an expert mathematician; but much

more important than his knowledge of figures is his knowledge of the average man. It is the knack he possesses for translating human nature into figures that makes his work so valuable. Without McCoy the legislative committees that deal with the subject of taxation and the raising of revenue would feel practically helpless

One of McCoy's tasks is to tell the Ways and Means Committee how much money a given taxation measure will bring in. That doesn't seem so difficult until you pause to think the proposition over. When a big revenue bill, such as the Underwood Tariff Bill, is drawn, the men who prepare it would have to work entirely in the dark unless they were able to get fairly accurate information on how much each item will provide. If the entire bill were estimated to bring in a billion dollars more than it does in actual practice the Government would be seriously embarrassed. There was a certain item of goods on which the import tax was ten per cent. It was planned to increase this tax to thirty per cent. Now it does not follow that the tripling of the tax would triple the revenue; for as a thing becomes more expensive fewer persons buy it. For example, if we charge ten cents admission to a picture theater we can get a big crowd and thus derive considerable revenue, but if we charged two dollars we might not get any paid admissions at all.

So it fell to McCoy to figure out what the income would be after various new revenue features of the

Underwood Bill were placed in operation. And in almost every instance he estimated with uncanny precision. He was able to tell in advance about what the returns of the income tax would be. In 1913 he estimated that the corporation tax for the year ending June 30, 1915, would be in the neighborhood of thirty-nine million dollars. I do not now recall the exact figures, except that he came within a mere $144,000 of complete accuracy.

It was desirable, for revenue reasons, to know, in 1901, what the census of the United States would be in 1910. McCoy came within a fraction of one per cent. of the figures that the Census Bureau obtained from an actual count of the population; in fact, McCoy was perhaps nearer to absolute accuracy than the Census Bureau itself was, for even in making a count there is an inevitable element of error. And yet he made his estimate nine years in advance!

How does he do these things? Simply by utilizing his knowledge of everyday human nature—and the law of averages. When he sought to know how much the population of the entire United States would grow in nine years I'll venture to say that he first examined the rate of growth along the street where he lived. Then he took other streets and compared them—and rural communities, picked at random. He probably figured that what would be true of these sample streets and localities would be true all over, for human nature is practically alike everywhere. He found out what kind of men

were having large families, and how numerous such men were in the average community. And he looked into the conditions that might increase immigration to this country.

One afternoon McCoy might have been seen standing on a street corner counting the number of automobiles and pedestrians that went by. Then he took a pad and pencil and did a little figuring. In a few minutes he had an estimate of the number of automobiles in Washington. He afterward got the actual figures from the District government and found that his estimate was practically correct. How could he tell that after seeing only the autos that passed one corner? Simply by comparing the number of autos and pedestrians with the total population of Washington. Later he went further and made a guess as to the number of autos in use in the United States. And he was not far off on either—as a more complete investigation proved. His figures were used as a tentative basis for a proposed war tax on automobiles. Think of a man's standing on a street corner and telling, just by means of what he can see there with his own eyes, how many automobiles there are in the whole United States!

Of course I do not wish to be understood as saying that he could make an accurate guess without taking various factors into consideration. He gave not a little thought to the relative purchasing powers of people in the city and in the country, the kinds of roads in different parts of the continent,

and the amount of gasoline annually consumed in the United States. But always his chief guide toward accuracy was the simple law of averages, and the fact that human nature is much the same no matter where found.

When there was talk of a war tax on club dues and admissions to moving-picture theaters McCoy was asked to submit estimates of the number of persons who belong to clubs and attend the movies. He had the figures the next day, and they were fairly accurate. In arriving at the number of clubs men belong to he simply made inquiry of every man he met. He found that one man out of every so many is a member of some kind of club. There are a great many more clubs, by the way, than people realize. It is not uncommon for one man to belong to several clubs, which brings up the average.

In trying to tell how many persons each day go to see the celluloid drama McCoy started his inquiry simply by asking his wife how often she went to a movie. Then he asked her how often her friends went. He happened to see a comic strip in an evening paper about a woman who went down town ostensibly to do shopping, but who attended three picture shows, one after another. That set him thinking, and he made inquiry as to the number of women who go to more than one show each day, thus boosting the average.

He didn't have to ask in Kansas or California, but right in his own neighborhood—among people

he knew. For he was willing to assume that if there are men or women in Washington who can't get enough movies to satisfy their craving there must be just such men and women out in Idaho and elsewhere. Well, McCoy figured it out that twelve million people each day in the United States witness the moving pictures. Some of the big picture producers and officers of their organizations were at first inclined to dispute McCoy's figures. But after they had examined into the thing thoroughly, checking up every available record, they gave it as their opinion that McCoy had somehow or other contrived to hit the nail on the head. And he had found all this out, mind you, just by casual conversation. He let the law of averages do most of his work for him.

Circus men have long observed that there are definite relations between the things people do and the size of the crowd. A number of men and women out of every thousand are sure to forget their change at the ticket window. The "walk-aways," as they are called, who forget their change, but do not know they have done so, and never return for it, are worth about twenty dollars to the ticket-seller in an average big circus crowd. When the crowd grows bigger, the amount of change thus left not only becomes larger, but at an increasing rate, as the mathematicians say—because people are more tense and nervous in a big crowd, and consequently, more likely to be absent-minded and forgetful.

An amusing thing about a circus crowd is this: Fully nine out of every ten persons, on the average, who talk to a circus man at the show grounds, are certain to ask him exactly the same question, to wit: "Where do you go from here?" Mind you, they do not say, "Where does the circus appear to-morrow?" or "What is your next town?" or any of the other numerous possible variations of the query. Always it is: "Where do you go from here?" And, as I say, the question is asked by nine out of ten of all the people who chance to engage a circus man in casual conversation.

Those who sold Liberty Bonds in theaters discovered many interesting things about crowds. It soon became an established fact, even in the earlier bond campaigns, that the subscriptions bore a direct relation to the contributing factors at any one particular theater. That is, it all depended on the kind of crowd, the size of the crowd, the personality of the speaker, and the sort of speech he made. The audience at a ten-cent moving-picture theater would not respond in the same way as the audience at a fifty-cent picture theater, or at a $2.50 drama. Because of the sheep instinct in people, a number of large subscriptions "planted" in the audience nearly always give a big impetus to other bond sales. If the speaker had a pleasing personality and injected a little humor into his talk—and the humor actually made the audience laugh good naturedly—he sold more bonds than if he adhered strictly to ponderous argument. In-

deed, too much argument about so obvious a fact as the patriotic necessity and wisdom of buying Liberty Bonds had a tendency to check the sale. People regarded it as presumptuous on the part of the speaker, almost as an insult, if he essayed to tell them their duty. They preferred to have him say: "I appreciate that you know your duty and that you will be equal to the situation."

While no statistics were gathered along this line, it was altogether evident to the experts in charge, that if they could have known the value of each factor of influence—and to have learned this would not have been impossible—they could have told in advance, by means of the law of averages, the exact amount of money that any one particular crowd would subscribe.

It is within the realm of things conceivable that this funny little law of averages may some day be hitched up and made to perform vitally important service that nobody thus far has ever dreamed of. Like electricity, it is a force that lurks about us all the while, and the extent of its use is limited only by our ability to see the possibilities of its application.

CHAPTER III

CASHING IN ON FOOTSTEPS

To a man owning a store with things in it that he wishes to sell, nothing could be much more important than footsteps. The more footsteps that pass his door, the more chance he has to do a satisfactory business. This is all obvious enough, and yet it is only within comparatively recent years that business men have been really taking footsteps seriously. It used to be that a man would rent a store location and rather trust to luck that there would be more footsteps there than at some other available place. To-day he is likely to *count* the footsteps in advance, before deciding where his store shall be. A famous cigar company has made a phenomenal business success by doing that very thing. Each one of the twelve hundred or more prosperous stores that they operate is dedicated to the principle that footsteps are the most vital item in retail trade. By counting footsteps, this company has discovered, more than once, that where they might rent a room for five hundred dollars a month on one side of a street, and lose money, they might rent a similar

room right across the street at one thousand dollars a month, and make a profit. It all depends on how many pairs of feet pass the store.

Whether it is cigar stores or apple stores, it is possible to operate them with almost mathematical certainty. A definite number of men and women out of every hundred, or out of every thousand, on the average, will buy apples if they pass by where apples are temptingly offered. If men are more inclined to buy apples than women, then one can afford to pay more for a location where men's footsteps predominate. It is on that basis that the best place for a cigar store in the whole United States happens to be at the corner of Broadway and Wall Street, in New York City. The traffic is almost continuous all day long, and most of the persons passing are men.

Another wonderful cigar store location is at the northeast corner of Broadway and Forty-second Street, in New York—which is probably by far the busiest corner in the United States. The traffic there is practically ceaseless throughout the twenty-four hours. As long ago as 1911 a count covering five different days showed that an average of nearly three hundred thousand persons passed there daily. By now the traffic is vastly in excess of that figure. While from the point of view of a man selling cigars, the proportion of women in the crowd at Broadway and Forty-second street is unfortunate, yet the location is only a trifle less desirable than the one down at Wall

Street, because there the business is active during only about nine hours.

At one time, the busiest corner in the United States was, strange to relate, in Newark, New Jersey—at the intersection of Broad and Market streets. But that corner comprised an exception to the rule that the value of retail property depends on the number of persons passing the property. The Newark corner, even when it was the busiest in the country, was not the most valuable. It was a transfer point from various car lines, and the traffic was out of proportion to the size of the city. Therefore the purchasing propensity of the people at that corner was not up to the average for the amount of traffic. The condition, being a freakish one, necessarily had to be an exception to the general rule. At the present writing, because of the diversion of a car line or two, the traffic at Broad and Market streets has been reduced, and Newark no longer can boast of having the Busiest Corner.

Now, the number of purchases at a cigar store, and the amount of each, will vary according to the character of the traffic. Obviously, the greater the proportion of women, the less desirable the location for selling cigars. In the long run, however, one man out of every one hundred and twenty-five who pass a cigar store will go in and buy. Men in one locality may buy more expensive cigars than those in another locality, but when one has a string of stores the average is

practically the same the country over. Naturally, a cigar store with a competitor next door will not do as well as one having an entire block to itself, but the thing averages up. And the same principles that govern the sale of cigars operate in selling any other everyday commodity.

As the price of the article sold increases, the definite relation between passers and purchasers decreases. A dealer in pianos cannot count on selling to any fixed number of persons out of every ten thousand who pass. When a man is in the mood to spend five hundred dollars for a piano, he is willing to go many blocks in quest of a place where he can get the most for his money. But, even then, the location doubtless tells the story in the long run. The piano display of the dealer where footsteps are thickest is seen by more people, let us say, than the display of his rival. Quality of goods and everything else being equal, a customer will recall first the piano store he has passed most frequently.

So far as the cheaper articles are concerned—the ones that people buy on impulse—the effect of footsteps on a department store is just as definite as if the articles were sold in a small shop. For that matter, the effect is fairly definite—as in the case of pianos—with regard to the higher-priced articles; but it is indirect, rather than direct. For example, women's cloaks are usually the most profitable thing sold in a department store—for the amount of floor space occupied. Now, an

average woman about to buy a cloak may, perhaps, walk all over the retail district before she makes her final selection. But the department store in a location that she passes most frequently is doubtless the first one that she thinks of when the cloak-buying notion strikes her.

A friend and I were walking in front of a five-and-ten-cent store which occupied one of the most valuable locations in the business section of a big Middle Western city.

"How can a store like that afford to pay such a big rent?" wondered my friend. "I should think they would do about as well over in a cheaper section of town."

The answer is, of course, that a store selling a variety of low-priced articles in everyday use may better afford to pay a big rent, if it conserves its floor space, than any other kind of establishment. It is possible for the proprietor to know in advance just what his monthly income will be. And he can judge, therefore, with the facts before him, whether the rent is high or low. He knows how many people daily pass the proposed location, and, approximately, what ratio of these people will buy each of the principal articles he is going to sell. Therefore, when he binds himself to pay a high rent, there is little risk about the obligation. He knows just what he is about. Thus it is that five-and-ten-cent articles lend themselves readily to the upbuilding of successful chain stores over the country. One cannot be entirely certain of

the income from one store, because of varying conditions of competition, but with a chain of stores there is every presumption of keeping to a definite average between the daily crowd on the street and each article offered for sale.

The cigar company with its hundreds of stores has figures that reveal many traits of human nature. It knows almost to the penny how much loss of sales will result from a certain velocity of wind. A rainy day, or a windy day, in New York, generally speaking, costs the company about four thousand dollars. The reason is obvious: it is not pleasant to smoke in a high wind. Many men do their smoking while walking along the street—because anti-smoking regulations prevent them from doing so in street cars or in certain buildings. If they are driven into street cars or buildings by wind or rain they worry along without their smoke.

This company even knows the approximate ratio between the mass of passing pedestrians and those who will wish to use a telephone. For that reason all the company's stores have pay telephones on the counter to attract men inside. A certain ratio of all who come in to telephone buy cigars before going out.

Many a business location is not as good as it looks. Here is a place on the busy side of the street; but the rents are too high. A man trying to sell cigars or gingersnaps there even in a small space will lose money. Across the street fewer people pass—but the difference is less than is

generally supposed. An actual count shows that the busier side is only fifteen per cent. more than the side opposite. But the rents on the quieter side are thirty-five per cent. lower. Taking the rent into consideration, the "wrong" side of the street may be the more profitable.

If there are two cigar stores or two drug stores on opposite sides of the street, and one of them is closed down, or consolidated with the other one, the expectation might be that the one remaining would get practically all the business of the store across the street. But, strange to say, that doesn't happen. Rarely will more than twenty per cent. of the business of the closed store go to the other one. When a store shuts down, its business scatters in all directons, like the fragments of a sky-rocket. The store on the other side of the street does not necessarily attract the man who was never in the habit of going there. He is just as likely to shift his trade to a place ten blocks away, on the same side of the street. This is more than ever true, in big cities, since automobile traffic became so heavy. It is no small task to cross a street these days. A man will not do it unless he has to.

On the other hand, if two stores are being operated side by side, or even within a few rods of each other, the closing down of one would make a big difference.

The item of habit must be reckoned with in another way. If a man has been dealing at a cigar

store three blocks from his office, and a new one opens up only a block away, he may keep on going to the more distant store, solely from force of habit. He probably does not even notice that the new store is there. Most people are unobservant. Hence a brand-new store will seldom do as much business, at any given location, as if it had been there for a long time.

CHAPTER IV

CANDY AND SODA

A CANDY store and soda fountain next to a five-and-ten-cent store will have more trade than if in a location, otherwise equally good, next to a piano store. And if it is next to a moving-picture theater in the suburbs, with all other conditions advantageous, it is in the best place of all. It is to be noted that many candy and soda stores are moving into rooms next to the moving-picture places. The movies have hurt the sale of the cheaper candies somewhat, because the youngsters who formerly saved their pennies for candy now spend them to see the pictures. But when a young man takes his sweetheart to a picture show, he is quite likely to escort her gently but firmly to a candy and soda establishment afterward and let her order whatever she likes. He realizes that the evening's entertainment has been less costly than if he had gone to a regular theater, and he feels as if he ought to do something else just to show a proper appreciation of her agreeable society, and to demonstrate that the mere item of expense is to him a thing of scant consequence.

Another item to be considered is the fact that

many happy young couples quietly munch candy while witnessing the movement of events on the screen. Such a proceeding might excite unfavorable comment in a well-lighted, high-priced theater, but in the darkened home of the silent drama it can be done and still leave one's social status intact.

This influence of the moving pictures on candy and soda sales is slight, however, in downtown locations. The person who comes out of a picture theater in the heart of a city is not at all in the same mood as the person who comes out of one in the city's suburbs, or in a quiet little county-seat town.

A candy and soda store in a small city where three thousand people pass its doors each day will do more business than if it were located where three thousand people pass in a large city. And, all other conditions being equal, it will do still better with exactly the same amount of traffic in the suburbs of a large city. It may be set down as a rule that the smaller the town or suburban place, the greater the percentage of passers-by that will enter the store. For some reason, a man strolling along a street in a small town or in the suburbs is much more disposed to pause and buy candy or soda water than he would be were he walking through the heart of a great, thriving city. Perhaps it is because in the quieter locality unless he eats candy there is not much else for him to do.

Having learned all the conditions that affect the candy and soda business—and this might be equally true of similar retail business—it is said to

be possible to predict within one tenth of one per cent. the relation between traffic and buyers. In other words, if one had all the necessary information at hand, one could foretell how many buyers and not miss it more than one person for every thousand. It does not follow, understand, that because so many people out of a thousand enter a store one day the percentage would be the same the next day. Conditions would have changed. The day of the week would be different, and doubtless there would be a slightly different temperature. Every little item affecting people's tendency to buy must be taken into reckoning.

More candy and soda water are sold at three o'clock in the afternoon than at any other time of the day. The next best hour is about eight o'clock in the evening. But eight per cent. more candy and soda are sold at three o'clock than at eight.

Only about one half the force necessary to handle the afternoon business is required at a candy and soda place in the forenoon. Except at stores where they serve noonday lunches along with the soda, the best forenoon hour is eleven o'clock. From then on the business keeps dropping until twelve. It climbs steadily from that time until three o'clock.

Five women buy soda water to every four men, making a man only four-fifths as good a soda prospect as a woman. On candy the two sexes average up about fifty-fifty. Women buy candy oftener than men, but men buy more at a time.

The average candy purchase, so one investigation showed, was just a fraction short of twenty-five cents. This included the expenditures of small boys who go in and get a stick of candy for a penny, and of adults who think almost nothing of dashing in and buying five pounds at a dollar or more a pound. All averaged up to about a quarter a purchase.

Candy sales mount up in winter because cold weather creates a demand for the heating effect of sugar. Hence the best place to do well with a candy store is in a cold climate. It is never too cold for the candy business. However, this does not mean that one might not sell more candy in New Orleans than in Fairbanks, Alaska. Climate is only one of many items. A candy manufacturer told me, though, that it is rather difficult to make a retail candy business pay south of Mason and Dixon's line. When candy sales drop off in summer, soda sales show just about a corresponding increase. People naturally like cooling drinks on hot days. Yet there is such a thing as having the weather too hot. When the thermometer rises beyond a certain point—which point varies according to what people in the locality feel that they can endure—the total of soda sales will be less than if the temperature were not quite so high. This seems surprising, and yet the explanation is simple enough. The weather is so hot that nobody wants to make the exertion necessary to walk to the soda fountain. However, on an atrociously

hot day, though the total sales of soda may be lower than usual, the number of sales compared with the amount of traffic on the street is exceptionally high, because many of the people on the street are there for the sole purpose of walking to a soft drink dispensary. From seventy-two to ninety degrees Fahrenheit seems to be the best for soda sales.

No two days of the week are quite alike for the sale of either candy or soda. The best day is Saturday, especially for candy, because people take it home for over Sunday. Monday is a good candy day, because many of those who did not lay in a supply for Sunday got hungry for it, wished they had, and determined to buy some the next time they were down in the business section. Any day of comparative idleness, such as Sunday, causes people to think of candy. They eat it not so much to appease their appetite as just for something to do. There is a certain restlessness that can be disposed of by munching candy or peanuts or by whittling a stick. Country storekeepers have often noticed that among their loafers the habitual whittlers are less disposed to help themselves to dried apples.[1]

[1] The facts and figures in this chapter regarding candy and soda were gathered without reference to the effect of prohibition—which is supposed to have a marked tendency to increase sales of both candy and soda. Just what this effect may be under nation-wide prohibition of alcoholic comfort, neither the author, nor those from whom he got his information, pretend to know

CHAPTER V

MEN'S MOODS AT THE LUNCH HOUR

NOT even so personal a thing as the way a business man desires to spend his noon hour is exempt from the law of averages. By studying all the conditions, we may tell not only what a man prefers to do at his luncheon period, but also how to make him act according to *our* wishes.

An advertising man and statistical expert by the name of Jay Lee Cross once devoted much thought and study to this phase of human nature. Cross was serving on a committee of the Cleveland Advertising Club, and it fell to his lot to make the arrangements for noonday luncheons and addresses which the club was in the habit of having nearly every week. Sometimes practically the entire club membership of more than four hundred would attend these gatherings; often there would be only a mere handful of members. As the food for the luncheons had to be ordered in advance and paid for whether used or not, it was extremely annoying and frequently disheartening to be without any way of telling how many would be present. They thought of having the members buy tickets in advance, but this did not seem satisfactory, for

the average business man dislikes to book himself very far ahead. He prefers to wait until the last minute, and then go to a meeting or stay away, according to the way he feels.

Cross began to take note of the weather on days when a meeting brought out only a small crowd. He saw that there was an unmistakable relation between the crowd and the weather, with regard not only to rain or sunshine, but to temperature. He found out by further observation that a great many other factors besides the weather went to determine the size of the crowd.

An important item was the day of the week. Men are busier on some days than others. But, even if he is busy, a man may leave his office, provided the attraction is great enough. He probably would not turn round in his swivel chair to see a mere Congressman, but would walk through slush and sleet to hear a heart-to-heart talk by the President of the United States. And no matter what the attraction is, more men will go to see it if it is cleverly announced. For example, if a famous actress were to give a Lady Godiva performance in an enclosed arena and you received a poorly printed handbill casually telling you to come, you would not give the occasion the same earnest consideration that you would if you were urged to be present in a cleverly worded letter, written on high-priced handmade paper, and personally signed by the woman's manager.

For four years Cross kept close track of about a

dozen different items affecting attendance at the club meetings. At the end of that time he compiled his figures on an elaborate layout of charts. He believed that from these charts he could forecast with reasonable accuracy the attendance at meetings from then on. He put his theory to a test, and the results were astonishing. After repeated trials he found that he could tell almost exactly how many men would gather together to hear a certain address on a certain day. Not infrequently he predicted the exact number. It was not uncommon at all for him to tell within one or two of the total number, out of a possible four hundred or more, and the farthest he ever went wrong was predicting four men too many.

As a result of these observations, covering several years, Cross was able to set down, with rather positive assurance of their accuracy, a great many of the average traits and propensities of the average business man.

For example, Cross discovered that in the long run a business man can be enticed away from his work more readily on Wednesday than on any other day of the week. The chances are that Wednesday is also the best day to try to sell him something. Monday is the worst day of all, because an extra large mail has accumulated over Sunday, and a man has a tendency to begin each new week with the intention of taking a flying start, sticking close to the job, and accomplishing greater things than ever before. By Tuesday this

first-of-the-week enthusiasm over his work has abated somewhat, but not so much as on Wednesday. Then the rush of the fore part of the week is over, and the rush to clean up everything possible before the end of the week has not started. Friday is the second best day of the week to lure a man from his desk. With the exception of Monday, Saturday is the worst day. Tuesday and Thursday are about a tie, but Thursday is a trifle the busier day of the two.

The ideal weather condition to bring people out is a cool, fair day in the spring or fall. This is especially true in the spring, for after being housed up all winter people like an excuse to get out and go to places. The most unfavorable weather is extreme heat. The average man would rather go out in the rain than on a day that is bright and clear but too hot. After the temperature climbs to a certain point he begins to make excuses when you ask him to join in any undertaking requiring physical exertion. Cold weather does not keep people indoors nearly so much as does heat or rain. Snow has little effect one way or the other—that is, a man will not go out on account of the snow, as he might on a beautiful balmy day in spring; but, on the other hand, the snow will not deter him from going. Slush, however, is something else again. It ranks with rain as an obstacle.

If you wish to announce a thing to a business man there is nothing so effective as a good letter. But, understand, it must be a good letter, well

worded and not too long. A good post card announcement, or a good announcement in a cleverly printed circular, is better than a poor letter. And Cross learned by experience that inclosing a return post card with an announcement was just twelve per cent. better than the same announcement without any return post card. It is human to deplore wastefulness, and a man dislikes to throw a perfectly good post card into the waste basket. So he takes it and writes on the little dotted line whether or not he will come to the meeting. Having taken his pen in hand to write "Yes" or "No," he rather shrinks from writing that he will not come, for he feels somehow that it makes him out a quitter. So if in doubt he writes "Yes." And having written that he will come, he dislikes to break his word. Such are the advantages of the return post card.

It appears that business men are fond of music. Just put the word "Music" on an announcement of a business gathering and, with all other factors equal, about twenty per cent. more persons will come than if you said nothing about any music. At least that was Cross's experience. If you go farther and tell just what the music will consist of, the pulling power of this item may be as much as fifty per cent. greater.

The average business man would rather be entertained than instructed. If you were to get hold of a world-wide authority on the very line of business a certain group of men are interested in,

and invite those men to come and hear him make an address, you probably would not get so large a crowd as you would if you told them that Harry Lauder would be on hand to sing funny songs.

Next to being entertained, however, a business man would rather hear a discussion of some phase of business in which he himself is especially interested. After that his favorite topics are those dealing with either politics or finance. The number of men who will go to hear an address depends to a surprisingly large extent not only on the prominence of the speaker but on the town he comes from. The best drawing card of all, as Cross discovered by scores of tests, is a prominent public official—the more prominent the better, on up to the President of the United States.

Leaving out of consideration a man's personal prominence and the job he holds, his drawing power varies according to his city. If he is a local man he does not excite the interest he would if he were from out of town. And if he comes from New York, everything else being the same, he is just eight per cent. more of an attraction than if he came from Chicago. In the long run an unknown speaker's pulling power is in almost direct ratio to the size of the city from which he comes. An announcement that John Jones is coming from Toledo, Ohio, is taken more seriously than a similar announcement about John Jones of Poughkeepsie, N. Y. No one ever heard of either Jones, but Toledo is larger, and men think, therefore, that

Jones from Toledo must be better qualified to discuss whatever it is he is going to discuss.

Two speakers will usually attract a bigger audience of business men than only one, but three will not attract as many as two. You see, it is impossible to pick one man who will appeal to everybody, but with two speakers there is a chance that those who do not care for one will like the other. The idea of three talkers scares a certain percentage of men away, because they fear that at least one, if not all three speakers, may talk too long. It is human to nurture a horror of being bored. Cross learned that though two is the ideal number of speakers for a businessmen's gathering, three speakers are almost exactly the same as one in drawing power. And if there are more than three, the drawing power is in inverse ratio to the number. Not quite so many will come to hear four men talk as to hear three, and the audience will be smaller for every speaker added until, if you have enough speakers, there will not be any audience at all.

CHAPTER VI

FOLLOWING THE CROWD

If you stop to observe the crowds on the street in the business section of almost any city, you will discover that the shady side of the street is the busy side. The south side of east and west streets, and the west side of north and south streets—or in other words, the side that is shady most of the day—gets the greater amount of pedestrian traffic.

There are, of course, occasional exceptions, due to some unusual condition, but, generally speaking, the busy side of the street is the shady side. And this is true not only in summer, when people seek the shade to escape from the heat of the sun, but in winter when the sunlight might feel altogether acceptable. The reason is that the shade in winter tends to prevent thawing, and that side is, therefore, less slushy. It is the dry side. This would not apply, obviously, to localities where there is no snowfall; but even an occasional snowfall has more effect than one might at first realize—because it encourages people to form the habit of walking on the shady side.

As a general proposition, the traffic on the shady

side of the street will average up about twenty-four per cent. ahead of that on the sunny side. If you have a store on the shady side of the street in Hicksville, or New York, the chances are that twenty-four per cent. more people walk by your place each day than pass the stores right across the way. No matter what hour of the day you make a count of the traffic, the one side in an average location is just twenty-four per cent. ahead of the other. As the traffic increases at the busier hours on the shady side, it makes a corresponding increase on the sunny side.

On Fifth Avenue, New York, the greatest shopping thoroughfare in the country, the difference between the two sides is perhaps less rather than more than usual. However, the west side of Fifth Avenue—the shady side—is distinctly the more crowded practically all the way along. An interesting oddity of Fifth Avenue traffic is that between Forty-second and Forty-fifth streets the crowd on the east side of the street contains more men than women, while on the west side there are more women than men. I have never found anybody who was able to explain just why this condition exists.

Pedestrian traffic shows a steady rate of increase from the time it starts in the dim, early hours of the morning until exactly twelve-thirty, at which time there are more people on the sidewalk than at any other minute of the whole day, except during the homeward rush between five and six o'clock

in the evening. From twelve-thirty traffic falls until about three-thirty, after which it has another steady rise—increased somewhat suddenly when the theater matinée crowds are poured out—until the homing crowd is unleashed at the close of the day.

Although the crowd is greatest at twelve-thirty and smallest in the afternoon at three-thirty, the percentage of people entering stores is much higher at three-thirty than at twelve-thirty. To be exact, the percentage of shoppers is lowest at twelve o'clock and highest at three. The reason for this variable percentage of shoppers is not difficult to find. At noon, when the traffic is the greatest, the majority of people on the street are there because it is the lunch hour. Any shopping they do is incidental to going out for a bite to eat. But at three o'clock in the afternoon the main thing that brings people to the street is the desire to look about the stores. A great many of those who were abroad at the noon hour are now toiling, —toiling in order that their wives and others may go forth and spend the fruits of their labor. Naturally, inasmuch as shopping is the reason for the greater part of the traffic at a certain hour, the ratio of shoppers to the total traffic then is exceptionally high.

Between eight and nine in the morning and from five to six in the evening there is a high peak of traffic on downtown cross-streets leading to main thoroughfares. If you were to count on the ordinary percentage of shoppers from this traffic

for those hours, you would go wrong, for the number of shoppers is astonishingly low. The traffic on these cross-streets at the hours mentioned consists largely of persons going to and from the street-car lines on the main thoroughfares. A person leaving his office for home at night, or going to it in the morning, is usually in more or less of a rush, and, therefore, not in a mood to stop and make purchases in stores he passes.

While the traffic on the shady side of the street is usually twenty-four per cent. more than on the sunny side, an exceptional condition may upset this average. For example, if most of a city lies to one side of a principal thoroughfare, as often happens in the case of a lake or seacoast town, that side of the main artery will get more than its normal share of the traffic. People are less easily enticed across a street in some towns than in others. Boston, for instance, is a conservative city, and its populace is inclined to be considerably bound by habit to do whatever it always has done. There is a street in Boston, leading to one of the railway stations, that is often so crowded on one side as to be almost impassable, and the other side is well-nigh deserted. A person walking along there could cross over to the quiet side and proceed twice as rapidly. One could save not only a good deal of time by crossing over, but also the annoyance of being jostled and shoved about. Yet so great is the force of habit that comparatively few cross the street in order to avoid the crowd.

In other cities habit has led people to cross certain street intersections diagonally. Just why the crowd should cut corners at one place and not at another seems to have no good explanation other than that it has become customary for people to do it just the way they do. An example of this corner cutting is to be found in the city of Youngstown, Ohio, where there is a certain busy street intersection that nobody ever seems to think of crossing at right angles. A number of cities have so-called "jay-walker" ordinances to prevent pedestrians from crossing streets diagonally, because of the danger from automobile traffic. It is entirely conceivable that such an ordinance might force enough additional foot traffic by a building to make a big increase in its ground floor renting value, and add thousands of dollars to the building's worth.

In a small village nearly the entire population of the place passes its busiest corner—or its nearest approach to a busy corner—each day. A smaller and smaller percentage of the population can pass the busiest location as the town grows larger. For instance, so I am assured by the experts, in a city of forty thousand only about eight thousand persons, or twenty per cent., will pass the busiest spot.

It will be only six per cent. in a city of six hundred thousand, and in New York it is barely two per cent.

The question might be asked: Is there any

important reason, other than the effect of sun and shade, why one side of a street should be busier than the other? Yes. Because more people usually live in one part of town than another. The average man has a tendency to remain on the side of a main thoroughfare corresponding to the side of the town in which he dwells. A man living west of Broadway, or west of Main Street, will probably stick to the west side, when he walks along Broadway or Main Street unless he has some good reason for proceeding otherwise.

The tendency of a pedestrian is also to keep to the side of the street where his business or destination is. He prefers to continue in a straight line and not turn a corner until he has to. A man's footsteps are just like a ball in a textbook on physics. They tend to continue in a given direction except in so far as his movements are interfered with by some other attraction. This attraction may be gravity, a pretty woman across the street, or the location of his office. Unless some slight necessity diverts him he will keep right on in the direction he starts.

If a man is walking along Fifth Avenue near Fortieth Street and wishes to go to Sixth Avenue and Thirty-seventh Street, he does not turn through to Sixth Avenue at once, and not even at Thirty-eighth Street, but waits until he reaches Thirty-seventh Street. If, however, he chanced to be walking along Sixth Avenue and his destination is a point many blocks away on Fifth Avenue, he

might turn through at once, for Fifth Avenue is the more attractive street of the two. There are so many pretty girls and so many more attractive shop windows on Fifth Avenue that a pedestrian might unconsciously regard that as a reason for deviating from his straight-ahead course; but, as I say, with all other conditions equal, a pedestrian will keep going right ahead without turning, just as long as possible. Straight ahead is the line of least resistance.

Sometimes the foot traffic may be thicker on one side for a reason that nobody can figure out. Years ago, on Sixth Avenue in New York, business was best on one side from Fourteenth to Eighteenth streets, but from Eighteenth to Twenty-third streets, the opposite side had the call. No one seemed to know why.

One might go on and try to figure out why more people live in one part of town than another. Naturally it depends on a thousand items—the price of residence property, the class of people, the presence, perhaps, of a lake or a view that forces up values in one place, or a nuisance that forces them down in another. With all other conditions equal, more people prefer to live on the east side of a town than on the west side; because the man who lives on the west side has the sun squarely in his face on his way down-town to work in the morning and in his face on the way home again at night, while the man who lives on the east side has the sun comfortably at his back both going and coming.

There are numerous cities where one may find trick corners—that is, corners where the traffic is either considerably more or less than one would think. On Chestnut Street, in Philadelphia, is a corner that looks extremely busy on a bright day. But on a rainy day the foot traffic drops off so much that the corner is conspicuously quiet. This pulls the average of the traffic so low that the location is generally regarded by experts as undesirable. If a stranger were to inspect the corner on a bright day he would be willing to pay twice as much rent as he would if he happened to see it in rough weather.

In Washington, D. C., is another peculiar corner. To begin with, the main shopping street in Washington has most of its traffic on the sunny side rather than the shady side, which is unusual. One reason for this is that the major part of the city lies to the sunny side of that street. Another reason is simply that more business happened to get started on the sunny side of the street than on the other side. One store attracted others, and the many stores attract crowds of shoppers. The corner I refer to is on the busy side of this main shopping street at the intersection of another business thoroughfare. So many people pass that corner every hour that it ought to be one of the very best retail locations in Washington. For several years it was occupied by men's furnishing establishments. But one after another of these failed to make a go of things.

I asked an expert one day why these stores had not prospered in so good a location. Without a moment's hesitation he told me, and the reason was so simple and obvious that I wondered why I had not known it before. It is a busy corner, but it is a woman's corner. Most of the traffic on the main shopping street is feminine. The rent for the corner location is necessarily high, because of the great number of passing footsteps, but most of the traffic is of no use to a store selling men's goods. It might be just the place for a drug store specializing on soda and toilet articles, or for a shop dealing in feminine *bijouterie* of one kind or another, but to try to sell men's goods there is unscientific, just as it would be even more unscientific to have a millinery shop on Wall Street, or a livery stable in Venice. Two or three doors from the freak corner mentioned one might have a haberdashery place and do well. For the volume of male traffic would be almost equally large, and yet the total traffic would be less, and this smaller total would mean a smaller rent—enough smaller, perhaps, to let the business show a profit.

At Broadway and Forty-first Street, New York, is a prosperous big grocery. If that store were moved a few rods north, to the southeast corner of Broadway and Forty-second Street—which is the busiest corner in New York—it is doubtful whether the establishment would pay so well, because the rent would be vastly higher, and the big increase in traffic would do the store comparatively little

good. In the first place, many groceries nowadays are sold by telephone, and, moreover, those who go into a grocery establishment rarely do so on the spur of the moment. When you set out from home purposely to buy a staple article like a can of codfish, it doesn't matter much whether the store is on the corner or just around the corner.

One of the most predominant of human traits is what one might term our sheepliness—the tendency to follow the crowd, to do what the rest of the herd does. When I was a lad I witnessed a practical joke that a traveling man played on our town. He went to nearly all the clerks employed in stores facing the courthouse square and got them to agree to drop everything, unless actually waiting on a customer and rush hatless toward the front door of the courthouse when the town clock struck three. The clerks did this, and practically everybody on the streets in that part of town—nearly *a hundred* men women, and children, by heck!—did likewise. They rushed pell-mell into the courthouse because they saw others hurrying in that direction. While they were doing this the clerks, who had started the great movement, slipped out the side door of the courthouse and returned quietly to their places of business to watch developments

A New York restaurant man thought of a way to make capital of this follow-the-crowd trait. He had an attractive little restaurant, neat and clean, and good food well served. Yet he was not

doing a successful business. People who passed his way were not aware of what a good restaurant it was. They had got into the habit of going to other eating places and they kept on going to those places, preferring to let well enough alone rather than to take a chance on something untried. The fact that nobody turned in at the restaurant kept people away. Nobody likes to eat in a restaurant where other people do not eat; they assume that there must be something wrong with such a restaurant. But if the proprietor could once get people started entering his door others might follow. So here was the scheme that the proprietor tried—and it proved successful: To every one of the comparatively few who bought a meal of him he gave two meal tickets, good on a certain day, provided they were used at the noon rush hour. In consequence of this there was a jam about his doors one noon that attracted attention. Those who saw the crowd assumed that the restaurant must be a good one else it would not be so popular. Many of them decided to try a meal there at the earliest opportunity. Gradually pedestrians began to turn in at that restaurant door, and everybody who went in helped to put the idea into the heads of others. Nothing is more natural, if you are hungry, than to enter a neat-looking restaurant that seems to be attracting crowds of other hungry folk.

Lights have a great value in attracting human beings, just as they have for various winged insects.

A certain storekeeper put a bright light in front of his place. It had the effect of making people stop to look into his window rather than into the window of his competitor next door. Then the competitor got a similar bright light. These lights, instead of merely offsetting each other, had the effect of stimulating trade in both stores; for they created a sort of center in that locality. Other merchants increased their illumination, until pedestrians abroad in the evening walked along there rather than elsewhere. Somehow that part of town seemed more cheerful and inviting. And the more persons that walked along, the more business the stores did.

Anything, whether lights, crowds, or music, which lures a man from home in the evening helps business. It stands to reason that the man who leaves his home on any pretext whatsoever will probably spend more in the long run than the man who is not enticed from home at all. The part of Broadway, New York, known as the Great White Way is an example of what plenty of light will do for a thoroughfare. Thousands of persons walk along there every night because everything looks merry and bright and cheerful. And thousands who are not attracted by bright lights walk there, looking at the lights, because they see other people walking along and looking at the lights. They desire to be where the crowd is.

One of the strange caprices of the pedestrian throng was shown a few years ago in Houston,

Texas. At the intersection of two principal streets was the busiest corner in town. A cigar company had a store on that corner. The property was bought for a big bank building and the cigar company had to move. It had its choice of establishing a store alongside of the bank building, or seeking a location on one of the other three corners at that intersection. The location next to the bank it did not consider at all, for reasons that will appear later. The two corners that ranked second and third in desirability were unavailable. That left the cigar company only one corner—the quietest corner of the four. So they took that one. And then what do you suppose happened? Traffic began to increase at that corner until it was the busiest of all—busier, even, than the one that had been first choice.

This was due partly to the fact that the cigar company used a lot of brilliant illumination about its place and partly because the bank on the busy corner made the traffic there decrease and seek an outlet elsewhere. Men who have studied location values always advise against placing a retail establishment—particularly one dealing in everyday articles—next to a bank. The idea is that a bank makes for a dead locality. Or at any rate, it tends to decrease rather to increase traffic. Being open only about six hours a day on the average, a bank has drawing power only for those six hours. Moreover, a bank has not much drawing power even when it is open. Few persons

have occasion to visit a bank compared with the total number on the street. Most of those who do enter it have their minds occupied with finance and are in no mood to stop and buy a cigar or a gingersnap, or whatever is sold next door.

I heard a retail expert bewailing what he called the flagrant waste of valuable retail locations by banks.

"Over there's a bank building on the best retail corner in town," he said, "and what good does it do the bank? Just as many people would deal with the bank if it were three doors up the street in the middle of the block. But not so many would enter a retail store two or three doors away as would if it were where the bank is. Putting a bank on a busy corner like that is an extravagance."

However, from the banker's point of view, the location may not be an extravagance. The bank may derive much indirect benefit. Every man who passes that busy corner is impressed not only with the fact that the bank exists, but that it is a bank able to build on a valuable piece of ground. This bringing of the bank to people's attention, along with the visible suggestion of prosperity, doubtless leads many a person to do his banking there instead of at another institution up the street.

Occasionally a business man has to consider whether he needs a volume of ordinary traffic or quality traffic passing his door. There was the

case of a big automobile concern manufacturing one of the highest priced cars on the market. This concern was seeking a new location for its salesroom in New York. It was obvious that one side of Broadway, at the place they had in mind, was busier than the other side—but this was true mostly at certain rush hours, because of the presence of a multitude of working men, and clerks, of modest salaries. Traffic on the other side of the street, while not so thick, seemed to be more leisurely, and contained, apparently, a greater number of persons who could afford to buy high-priced automobiles. Moreover, because there were fewer people in the way, anyone interested in buying an expensive car would have an opportunity to look into the display window without being jostled about. The concern decided, therefore, that the less active—and less expensive—side of the street was best for its purposes, even if the rent had been the same.

For similar reasons, by the way, a merchant must be careful with his window displays or he will attract merely idle curiosity seekers rather than potential customers. If a furniture-store man fills his window with a colony of prairie dogs he is likely to have the sidewalk in front of his place blocked by small boys; and persons walking by, who may have an intention of buying furniture, will be so annoyed at having to walk round the crowd that they will probably buy their goods at some other store.

Footsteps make values and footsteps take values away. The manager of a department store decides to move two blocks east because, while fewer people will pass his store there, he will have a newer and more attractive place and the rent will be so much lower that he will not require the same gross income. And he figures, too, that presently the retail center will go in that direction. Another big store or two follow his example. Now these stores are high-grade establishments, having a reputation for giving good values, and they have a big list of customers.

Not all these customers follow them to the new location, but a great many do. That means fewer footsteps in the old location, and there is more disparity than ever between the rent asked and the value given. In other words, the rent costs are constantly going higher, and the property owners do not overcome this by making improvements. Still more establishments move up the street. And when they move they take footsteps with them. Before long the block or more that was once the heart of the retail section is dead. And it will stay dead. It is too late now for the property owners to make improvements. The footsteps that made the values have moved along and will return no more.

Nearly every growing city sooner or later witnesses the phenomena of footsteps moving up the street and forming a new retail center. It may be because property owners blindly force footsteps

and values away, or it may be simply because the city is growing more rapidly in one direction than in another, and footsteps follow—as is their habit—the main arteries of traffic.

CHAPTER VII

STREET CARS AND PEDESTRIANS

ONCE there was a prosperous retail merchant who did not fully comprehend the ways and caprices of the humble pedestrian. He picked up his newspaper one evening and read with much satisfaction that his city was to have an additional through-car line to the suburbs. This indicated not only that the town was showing a healthy, substantial growth but that it was progressive. The merchant assumed that as the town grew he would grow with it. Another good car line would be another means for shoppers to get in from the outskirts. This meant more business, and he, of course, would get his share. As he thought of the new line of transportation, with its bright new yellow cars, he unconsciously pictured many of the passengers—in fact, a big proportion of the passengers—carrying large bundles of costly things bought at his store.

Yet from the day the new car line was started that merchant's business began to decline. In six months he barely escaped going into the hands of a receiver. He had never paused to consider that the car line passed down another street, a block

away from his store. That street had always been rather unimportant as a retail section, and it had not occurred to him that the mass of people who were brought down from the suburbs and deposited there would take the street seriously.

He supposed that everybody who had been in the habit of walking by his store to and from the street car, morning and evening, would continue to do so. That was where the merchant showed his lack of understanding of the average pedestrian—a creature disposed to practice rigid economy in footsteps.

A man comes downtown each day, alights at a certain corner, and proceeds toward his office. This walk from the car to his office takes him past certain shop windows. He learns from these windows what is kept inside. One window has a display of shirts and another contains coils of garden hose. Now, the pedestrian may not rush in and buy shirts or garden hose just because these things are there on exhibition; but they nevertheless make an impression on him. When he suddenly finds himself in need of shirts or apparatus for squirting water at his vegetable garden, everything else being equal, he thinks at once of that store. It may be a store that does little advertising and that he would never have heard of except for having passed it in going to and from the street car.

Every thousand pairs of footsteps passing a retail store is an asset to that store. When any-

thing occurs to pull away some of these footsteps the proprietor must make extra effort and show added enterprise, or his business will move backward. He must increase his advertising or offer more attractive bargains. And the merchant who sees a new stream of footsteps suddenly shunted in his direction should be quick to take advantage of his opportunities. People begin to pass his place who never did so before. If he presents a dingy front they may continue to pass his place—just that and nothing more. But if he brightens up his windows, wigwags signals of ginger and enterprise, and makes his presence felt, he may entice within his doors open-minded newcomers who are provided with ready money.

Nothing has so much effect on passing footsteps as the item of transportation. Every new surface line, elevated line, or subway means a pedestrian readjustment. People who have been accustomed to catch a car home by walking over to this point now walk over yonder. New pedestrian habits are soon formed and people walk over a given route day after day. It is surprising how unwilling a person is to deviate from his accustomed route unless there is some reason for doing so. Didn't you ever have the experience of strolling along with a friend until you came to a corner where he wished to go one way and you another? You were walking purely for pleasure, let us say, but you each unconsciously preferred to follow a certain route simply because you were used to it.

The thing that completely upsets people's walking habits is transportation. Sometimes I am inclined to think that transportation rather than competition is the real life of retail trade. The subway, for example, revolutionized retail business in New York City. It is only recently that New York has begun to get adjusted to the first subway. It was a long time before business men in certain localities realized what had happened. This process of readjustment to new subways is still going on, and will continue to go on as long as still more subways are built or projected.

The great boom which changed Fourth Avenue from a dead street to one of importance was due almost entirely to the building of the first New York subway which has several stations along that thoroughfare. It doesn't seem long since the Flatiron corner, at the intersection of Fifth Avenue, Broadway and Twenty-third Street, was regarded as the busiest corner in the United States. Then the subway was placed in operation and soon a great many more persons passed daily at Fourth Avenue and Twenty-third Street than at the Flatiron corner.

When two newer subway lines were opened—one under Broadway, and another under Seventh Avenue—another set of readjustments immediately began to take place at various points in New York. For example, the new Broadway subway, with entrances at Thirty-fourth Street immediately pulled foot traffic away from Thirty-third Street

and scattered it along Thirty-fourth Street for a distance of several blocks. Formerly Thirty-third Street had been the busier cross street of the two.

Here was the reason: At Thirty-third Street and Fourth Avenue is a subway station; at Thirty-fourth Street and Broadway is both an elevated station and the entrance to a tube leading to the suburbs. These stations, three blocks apart, had an astonishing amount of pulling power. The average pedestrian on Fifth Avenue, headed for the Thirty-third Street elevated station, turned down Thirty-third Street. Likewise, the man walking up Broadway, who wished to go across to the subway at Thirty-third Street and Fourth Avenue, turned the corner at Thirty-third Street. Then there were all the shoppers and others who were in the habit of getting off the elevated trains at Thirty-third Street and at once proceeded up that street toward Fifth Avenue.

Such were the conditions. But the moment the new Broadway subway entrances went into use at Thirty-fourth Street, a vast number of people ceased to go from Broadway over to Fourth Avenue, and many more ceased to use the elevated station at Thirty-third Street. But a great throng began to come from Fifth Avenue and elsewhere to take the new subway at Thirty-fourth Street. All this necessitated a readjustment to the new conditions by retail merchants who were affected. Stores that people passed on Thirty-fourth Street doubtless felt the benefit of the increased traffic.

It was mainly the subway that killed Twenty-third Street as the heart of the retail section. Years ago Canal Street was the principal retail street in New York. Then retail business moved gradually up to Fourteenth Street, which has a cross-town car line; from there it moved on to Twenty-third Street. The reason for this movement was simply that business has a tendency to go toward the main residential locality—to avoid making the customer travel too far. The stores could not meet customers halfway, but they tried to meet them at least part of the way. Before the subway was built it represented considerable effort for shoppers to move from one part of the city to another. If the leading stores were scattered all over town, shopping would be such a wearying operation that a great many people might be discouraged from buying. Either that, or else they might go to the store having the most convenient location and do all their buying there, rather than go to the trouble of looking into values elsewhere. So it was an advantage for both retailers and shoppers to have as many good stores as possible in one place. And that was the situation. Nearly all the leading department stores were on Twenty-third Street. The proprietors thus cooperated to attract shoppers to that locality.

With the opening of the subway it was much less of an advantage to have all the big stores close together. A woman could come from One Hundred and Twenty-fifth Street to Twenty-third

Street, and go from there to Forty-second Street so easily that the journey itself was the least of her troubles. She no longer objected to visiting two localities instead of one. Moreover, rents were cheaper farther uptown—nearer the residence section whence shoppers came. So, one store after another began to seek locations up round Thirty-fourth Street, and beyond. To-day the heart of the New York shopping district is on Fifth Avenue from Thirty-fourth to Forty-second streets. And it is said to be moving north at the rate of an inch an hour!

Now, the most surprising thing of all is that scarcely any of the landowners down in the Twenty-third Street neighborhood seemed to know what had struck them. They had not anticipated—when the original subway was first projected—what the effect would be. And, after the thing had happened, they were slow to realize that the subway was the cause.

Just to show in figures the change that took place: I happen to know of a loft building, near Twenty-third Street and Broadway, where one floor used to rent for ten thousand dollars a year. After the retail exodus toward Thirty-fourth Street the rent dropped to nine thousand dollars. Based on the relative amount of traffic, the decrease should have been much more than that, but renters were not yet fully aware of the change that had occurred. When everybody came to perceive the actual situation it was impossible to rent the floor

at all. It remained idle for several years. Gradually, however, Twenty-third street began to come back--not as a retail but as a wholesale district. Finally, the floor I mention was rented for five thousand dollars a year—just half what it once brought—and the owner was overjoyed. The chances are that some day the rent will go to six thousand dollars, and probably even more than that, but it is extremely doubtful if it will ever get back to the high point where it once was.

This lowering of rents meant, of course, a corresponding depreciation in property values. The building of the subway cost landowners along Twenty-third Street and elsewhere millions upon millions of dollars. But there were big boosts in values in other sections.

Another effect of the first subway was on small retail establishments in the outlying districts. When shoppers were dependent on the comparatively slow-moving surface and elevated lines for transportation downtown, a woman living out at, say, One Hundred and Twenty-fifth Street, who wished to buy a pair of shoes, might make the purchase at a small store a block or two from her home. Many of these small neighborhood stores did a thriving business, especially in the more staple articles, because people dreaded the ordeal of a journey clear down to Twenty-third Street. But the subway made a trip to the heart of the shopping district so quickly and so easily that women preferred to go where there was a larger stock of goods

from which to make selection. Countless small stores in the outlying sections were put out of business. Stores in Brooklyn and Newark were quickly affected when the under-the-river tubes were opened to those places. Women flocked to New York who formerly had stayed away because of the time and annoyance of getting there. On the other hand, however, many New Yorkers now buy in Brooklyn who never did so before—who, in fact, had never even been there before. Brooklyn store proprietors are enterprising enough to take advantage of their smaller rents and offer bargains that attract New Yorkers across the river. "Brooklyn is no farther from New York now," as a native of that borough once observed to me, "than any other place is."

Any serious interference with the established order of things in street-railway transportation means a shake-up in conditions of pedestrian traffic. Some time ago a number of politicians in Denver had the route of a downtown car line shifted to a street a block away. The consequence was that one street had a boom and another became an invalid. In Cincinnati practically every car line used to make a loop at Fountain Square. This was changed to some extent, and a number of store locations on or near Fountain Square are no longer worth the rental they once were.

When a new transportation development creates a brand-new business section, a store in that

section will ordinarily do more business than it would with exactly the same amount of foot traffic in an older location. That is, the ratio of purchasers to pedestrians is likely to be greater in a section where all the stores are new. The reason is that where the stores are new the goods they contain are new; the proprietors, perhaps, are new and anxious to please. Everything looks spick and span and inviting. Each store is a novelty in iself. As the section grows older and the appearance of freshness wears off there is a tendency toward slow, gradual decadence. The man who is constantly on guard against this, and who keeps his store just as inviting as the day it was opened, has that much advantage over his neighbors who permit themselves to go stale. Traffic will unconsciously tend to slow up and pause in front of the place that shows snap and enterprise.

CHAPTER VIII

HUMAN ANTS

SOMETIMES when I watch a party of ordinary black ants proceeding excitedly about their chores, dashing here and there, and then retracing their steps in rattle-brained fashion, seemingly without any definite plan, I wonder if the average ant is not a somewhat overestimated individual.

Regardless of all the marvelous intelligence attributed to them by the scientists, ants are quite likely to impress a thoughtful, unbiased observer as being stupid beyond all necessity. They are industrious, as everybody concedes, energetic and thrifty, but are they truly efficient? Apparently they have a predisposition toward lost motion, and do a lot of running around to no purpose. They act like creatures willing enough to be on the job, but lacking proper supervision from the main office.

Yet, on the other hand, we may be doing the ants an injustice. Maybe they know exactly what they're about. If we go according to mere outward symptoms—the movements to and fro and up and down on the earth—human beings seem scarcely more systematic or logical than ants.

Balloonists, aviators, and other persons in the habit of roaming about the skies, where they can get a good unprejudiced slant at mankind, tell us that they come to have almost a contempt for mere humans because of our foolish appearance of ant-like aimlessness when considered in the mass.

Nevertheless people do move about according to law and reason. An individual may not know why he is going in a certain direction, but some force directs his footsteps. The force may be the impetus of a crowd which shoves him along, or it may be simply habit—such as the habit, for example, of walking on the right side of the street.

You see a crowd of people moving about a store, and at first glance nothing could be more ant-like, more dependent on human whim and chance, and less according to rule, than their movements.

Yet it is possible to know not only where most of the crowd in a store will go, but, in a general way, what they will buy. Once you know where most of the people are going to walk, you can tell where is the most effective spot to display things that one especially desires to sell. One may even lay off the floor space of a store into small sections and figure out—knowing where the people will walk—the rental value of each section.

In a store twenty feet wide by one hundred feet deep, for example, the space in the first ten feet back from the street, including the show windows, is worth almost one fourth as much as the entire floor area.

And there is a point on the right hand side of the middle aisle, between fifteen and twenty feet back from the front entrance, which is the most advantageous selling place in the store. If you were offering a bargain in candy, for instance, you could not possibly sell as much anywhere else—other things being equal—as you could right at that space.

And what is the reason? Why isn't the space just as good on the left hand side? Or a little nearer the door?

One of the contributing forces which determine space values in a store is the fact that people in America are accustomed to keep to the right. Whether driving along the street, or strolling along the sidewalk, we ordinarily adhere to this rule.

In a store we can walk in any direction we see fit—toward whatever display attracts us. But for a moment we seem to forget that we are no longer required to follow traffic regulations. Having entered the store we continue to keep to the right.

One may glance into almost any busy store at any hour of the day and observe for himself how much larger the crowd is at the right than at the left of the front door. In big establishments where there are ladies' rest rooms on each side of the first floor, the one on the right is nearly always used about twice as much as the one on the left.

After proceeding down the aisle at the right-hand side for a short distance the majority of

shoppers appear to become disgusted with trying to force their way through the crowd ahead, and then it dawns on them that there is no law against walking on the left side of the aisle. At any rate, they begin to cut across to the other side. But having crossed over, once more there is a tendency to keep to the right, and they gradually swerve back again. Possibly this is because they relax after getting by the thick of the crowd and the force of habit prevails.

There is a general scattering as they get farther from the entrance, but more people reach the extreme rear of the store on the right than on the left side of the aisle. And a counter at the rear of the store is a better place to sell goods, by the way, than a counter a few feet nearer the front. For people, having gone to the turning-around place, are likely to pause and glance about them before starting back.

Now, if they continued to bear to the right on the return trip they would swing over to what is the quieter side of the store. But the strange thing is that they return toward the front on what is then the side to their left, the same side that they came in on. The reason is that the incoming traffic tends to force them to the left.

At a certain point—which varies according to the size and arrangement of the floor area—the incoming and the outgoing traffic meet and crisscross. It is the counter nearest to this point that is the best display place in the store.

For, not only are there more shoppers there than any place else, but they are compelled, because of one another, to move slowly and have opportunity to look at whatever is displayed about them.

As already stated, this point in a store having a floor area of, say, twenty by one hundred feet, would be in the neighborhood of eighteen feet from the front door on the right-hand side. A counter directly in front of the door might attract more attention than anywhere else, but it would block the aisle too close to the entrance. On either side of the entrance are, of course, excellent selling locations. In fact, there are *more* square feet of good selling space there than anywhere else. But the one little spot of greatest selling possibilities is farther back.

This problem of where people walk in stores, and why they do it, excited the interest, sometime ago, of a statistical expert. For a period of two or three years he conducted experiments in stores of different kinds in various places. He tried selling small articles in different parts of the stores under all manner of conditions. Usually he used candy—small sugar wafers, of different flavors—in conducting the experiments.

An inexpensive article had to be employed for such tests, for it is obvious that the selling power of one location over another would not be so applicable to the more costly articles which require thought and consideration before buying. A man may have his attention attracted to a toothbrush

or an assortment of candies, and buy, but the mere fact that he suddenly comes upon a clump of farm tractors does not mean that he will order one sent home.

One of the difficulties of the experiments lay in the fact that it was necessary to make proper allowance for varying conditions. For instance, to sell more candy in one part of a store on Monday, than in another part on Tuesday, would not prove anything. Because there are more shoppers on Monday. Moreover, even if the number were the same, people are rather more likely to spend money freely on Monday than on Tuesday.

Then, the weather, rain, cold, or a warm spell, each exerted an influence over people's desire for candy. By making a careful count, however, of the number of persons entering a store, and making such allowance as his experience had taught him was proper for each change in conditions, the investigator finally learned a number of things about people which enabled him to formulate some fairly positive rules.

He found out that a display in the window at the right of the main entrance is much more effective than one in the left-hand window—simply because people enter a store at the right-hand side of the door and are likely to look at the window on the way in.

By repeated tests he found out just how much the sales of an article can be increased by a clever display of the article in the show window. There

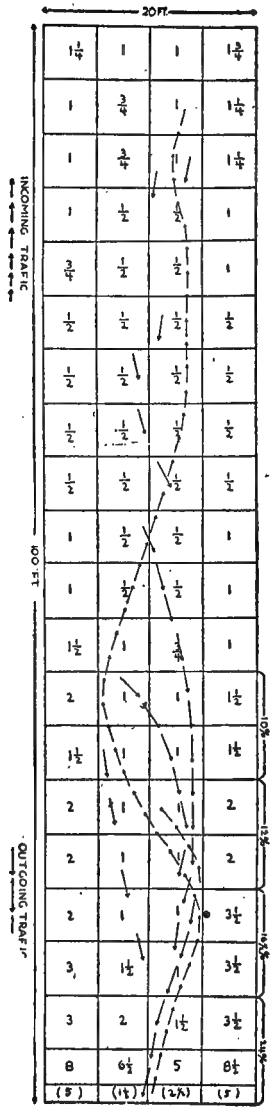
must be a separate rule worked out for each store and each set of conditions, but in a general way one may say that a good window display will boost the sales of a small, inexpensive article about fourteen per cent.

The space devoted to show windows is worth a surprisingly large proportion of the rental value of the entire store. In one store, more than one hundred feet long, the windows, only two feet deep, proved to be worth twelve per cent. of the rent asked for the whole place.

It was found, too, that there is a definite relation between any window admitting light to a section of the store, and the sales in that section. Generally speaking, a window on the side will add about one per cent. to the value of the part of the store it brightens. And this one per cent. will be drawn from the value of the darker parts of the store.

Ordinarily, in a store twenty by one hundred—using that size as a standard of comparison—the five-foot square, including the show-window space, in the right-hand front corner, would be the most valuable five-foot square in the whole area. This small space would be worth 8½ per cent. of the total rental. The next five-foot square toward the rear would be worth only 3½ per cent., and the next two after that about the same.

From that point there is a gradual diminishing of value for spaces along the right-hand side of the store until, a little more than half-way back, a five-



foot square is worth only one half of one per cent. of the store rental.

Then there is an increase again toward the rear, and the two rear corners—where traffic is compelled to slow up—are worth 1¾ per cent. on the right and 1¼ per cent. on the left side.

A study of floor space values leads one into the question of frontage values. Obviously, five feet more across the front, on a busy street, with thousands of people passing, is worth considerably more than an equal area of space added to a store's depth. But how much more can one afford to pay for a place forty feet wide than for one only twenty feet wide?

At first thought, we may say that forty feet is twice as valuable as twenty feet. The truth is, however, that when one rents a store on a thoroughfare full of passing footsteps, he pays for two

different items—space and location. And the location is perhaps the more valuable of the two.

Moreover, one may buy location without buying much space. For example, a cigar store ten feet square on the busiest corner in the world can make a fortune. It has little space but it has unsurpassed location, and the rent paid would be chiefly for the location.

Whether the space was ten feet or one hundred feet would really not make a great deal of difference to a cigar dealer. Once he has the location, any additional space he buys is just simply additional space, to be paid for as space and not as location.

So it is if a man has a shoe store or a candy store on Woodward Avenue, in Detroit, or Fifth Avenue, in New York. Everybody knows that a certain store is at a certain place on Fifth Avenue. If the store suddenly becomes twice as wide, it is still nevertheless in the same location. The space value has doubled, but the location value has not.

Yet even the location value has increased somewhat, for the store is now more noticeable, more conspicuous than when it was smaller. Pedestrians who formerly may have overlooked the place now drop in and make purchases. How are we to know how much a few feet of additional frontage adds to the worth—to the selling capacity of an establishment?

First we must assume that the frontage a store has to start with is adequate for conducting the kind of business it contains. For instance, if a

dealer in furniture, or motor trucks, undertook to get along in a space only large enough for a cigar store, even in an excellent location, he might find it impossible to conduct a profitable business. Additional frontage might mean the difference between failure and success. A store three times as wide, so that he could display his stock, might be worth to him not only three times as much, but perhaps ten times as much.

But if the proprietor of a little restaurant has a place reasonably large, in comparison with other restaurants, and yet, wishing to expand his business, doubles his frontage, how much more should he pay.

In trying to arrive at the solution of this problem the investigator estimated and theorized and observed and still he did not have the question satisfactorily answered.

Then he did a very simple thing: He began to ask scores of business men in various cities, who had enlarged their establishments, what the results had been. Did doubling their frontage mean a doubling of the gross income? If not, how much increase did it mean?

After carefully tabulating the results of these inquiries, it was found that there is a rather definite relation between the increases of store frontage by prosperous establishments, and the gain in their total receipts. He considered these facts and figures in the light of what he had already learned about floor-space values, and finally he came to

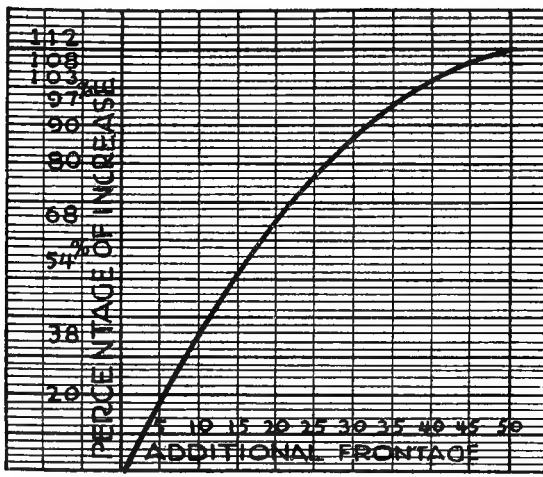
some pretty definite conclusions. He set down a schedule of values for increased frontage, and, then by further investigation and repeated tests he found that his schedule would "prove up" as correct.

When a man has a store with, say, 20 feet of frontage on a busy street and increases this to 40 feet, he is not justified in paying double his original rent. To be exact, the additional 20 feet is worth to him only 68 per cent. more than he has been paying. If his rent has been $100 a month it should now be $168. If he jumped from 20 to 70 feet frontage, or, in other words, if his store is three and one half times as large as formerly, his rent should be increased by only 112 per cent.—from, say, $100 to $212 a month. The accompanying table of figures shows the worth of various frontage additions to a 20-foot store.

It should be understood that the amounts here indicated as a proper rental are from the point of view of the man who pays the rent rather than from that of the man who owns the building. The owner might be able to get more by renting to somebody else. Two small stores might, in many instances, very properly pay more to a landlord than if the same space were all devoted to one store. The point is that the renter should know what a given amount of space is worth to him.

We are living in an era when business men are coming more and more to know what they're about. Every year scientific precision takes the

place of some item of guesswork. Not long ago a man of my acquaintance wished to start a candy store. He did not seize upon a location at random and trust to luck that he would do enough business to pay the rent.



First he observed the traffic in various parts of the shopping district until he found a locality where the women pedestrians were noticeably more numerous than men. He counted the traffic at a certain point which appealed to him, and found that the average number of persons passing each day was 15,557—9307 women and 6250 men.

Now, previous investigation had taught him that the grade of candy he expected to sell would

attract into his store two and nine tenths women out of every hundred passing, and one and five tenths men. Therefore, he might expect each day 269.9 women buyers and 93.75 men, or a total of 353 persons in his store each day.

He picked out a vacant store room 1500 feet from any other candy shop. That distance from competition, he happened to know, would mean an average purchase of about 35 cents. Multiply the number of persons expected to enter the store by 35 cents, and we have $123.55—the average expected daily receipts. On that basis, allowing 300 business days to the year, the annual gross income should be $37,065.

The man knew that 20 per cent. of his gross receipts would be a proper allowance for rent, provided the store was of a certain size. Therefore, he could pay $7413 annual rent for a store of that kind.

But the room he wished to use was of such width and depth that it was worth only 70 per cent. of the store that he used as his standard. The most he should pay, then, for the room he wanted was $5189 a year. He went to the owner of the building and found that he could rent the room for about $3800 a year—or nearly $1400 less than he could have afforded to pay.

In other words, he had a profit on his rent of $1400 a year to start with. He could sell that much less candy than he had reason to believe he would sell, and still make his customary rate of

profit. And he was in the excellent position of knowing vastly more about the value of the storeroom he needed than the man who owned it.

Such are the business advantages of knowing exactly what one is about. Human ants are we, and we are full of whims and caprice. But the retail business man who fails to know just what we ants are likely to do at any stage of the route, and to make capital of his knowledge, is guilty of ant-like leather-headedness, and sooner or later may come out at the little end of the horn.

CHAPTER IX

HUMAN NATURE AND THE WEATHER

WHEN you try to think of a line of business quite unaffected by weather conditions, you must keep on thinking for a long time. The effect of weather on all kinds of business is almost equal to its importance as a fulcrum on which to pry open conversation.

The average man responds to weather in a rather definite manner. Seasonable weather is good for nearly every line of business where something is sold over a counter. Cold weather boosts more lines of trade than hot weather. It is an old saying that cold weather helps everything except the ice and hammock business. Rain may do good, or harm, according to what one has to sell. And it makes a big difference in certain lines whether a rain comes on one day or another—whether in the morning or afternoon. Moreover, the effect on a small town store is not the same as on a city store.

In a large city, the business of a department store is seriously hurt by a rain in the forenoon, but rain in the early afternoon is usually a big help. Most customers of a big city department store are women, and the majority of them live out some

distance from the store—at the edge of the city, or in the suburbs. If it rains along about eight or nine o'clock in the morning the woman who had planned to go shopping that day is quite likely to change her mind, even though she did not intend to go until afternoon. The rain not only suggests discomfort in getting about, but diminishes her desire or immediate need for certain articles, and drives the shopping idea out of her head. On the other hand, if it is bright and clear in the morning, but clouds up about noon for a heavy downpour which lasts most of the afternoon, it is the best thing that could happen for the department store, because shoppers get in, and cannot comfortably get out. They shop all over the store, buy lunch there, and then shop some more.

While the rain is thus helping the department stores, it may hurt the smaller shops, because many customers who otherwise would look around are obliged to do their buying all under one roof.

An advertising man lost several thousand dollars because of rain one summer, and yet there was less rain than usual. The trouble was that most of the rain fell on Sundays. This man took charge of the advertising of a big newspaper on a salary and commission basis. The paper made a specialty of real estate advertising in the Sunday issue, and he figured that his share of this alone would give him a good income. But, by a rare quirk of chance, nearly every Saturday for several weeks there was a forecast of rain the next day—and the real estate

© *American Magazine*

Rain in the forenoon hurts business; but rain in the afternoon has a tendency to help business

people either reduced the size of their advertisements or canceled them entirely. It is not much use to spend a large sum of money to tell people how to reach a beautiful suburban allotment, on a rainy day. One Saturday the Weather Bureau announced showers for Sunday, and nine thousand dollars' worth of advertising was canceled. But the next day saw never a cloud in the sky from early morn till set of sun. The advertising man might have bought himself a fairly good little automobile with extra rim and casing for what the Weather Bureau's error cost him.

Rain is the worst of all weather enemies to business. Much department store advertising is canceled entirely on the strength of a rain forecast. Naturally there is little use in making costly announcement of bargains that shoppers will be prevented from coming to see. A sudden change to warmer or colder weather, however, is usually advantageous. Many big stores have advertisements in the newspaper offices awaiting the coming of a sudden shift in temperature. One year there was a late fall, and the page announcement of a big overcoat sale by a Brooklyn establishment lay in type for three weeks after it was expected to be printed. One afternoon, about an hour and a half before press time, the weather turned suddenly cold, and the overcoat advertisement was ordered slapped into the papers at once.

Women shoppers are extremely superficial in a way; they do not consider what the weather will

be to-morrow nearly so much as what it is to-day. Every smart merchant knows that he can sell winter goods in the spring so long as it is cold and snow is on the ground. The fact that the calendar shows it to be spring rather than winter does not matter at all; the weather is the main thing.

Let us assume that there is a belated spring. To-day is cold and bleak and snow is falling. Yet even if all the women are convinced, let us say, that to-morrow the thermometer will go up to seventy degrees, and that there will not be another cold day for at least six months, they will still buy heavy coats, suits, and furs. Reversing the conditions: If in the fall of the year it is warm and sultry, but the women believe that to-morrow it will be freezing and stay that way all winter, they will not buy winter things until the weather changes.

The deplorable feature of this phase of shopping psychology, as the merchant looks at it, is that the sale deferred too long is deferred forever. If it is a warm fall or a cold spring and stays that way for three or four weeks longer than usual, a great many persons decide that the season will soon be over, anyway, and that they may as well make their old clothes do.

The summer that is cool until late in June is a great money-loser. Women will not buy while it is cold, and when it does get warm they do not buy because they feel that the summer will not last long enough for them to "get the good" out of thin clothes.

While retailers ask nothing more than good rational, seasonable weather, they are frequently helped by weather that is freakish and unseasonable—provided it comes early rather than late. If there is a cold day early in September, people catch the notion of buying fall and winter garments. Having started early to buy, they keep it up all winter. It is simply the old, old story of one sheep jumping a fence and the others gayly following. Besides, one thing suggests another. The woman who acquires a handsome, expensive little coat in September soon thinks of various things that she regards as downright necessities to go with it. Her old hat that she had planned to fix over will not do at all. And nothing could be more absurd than to wear a smart new coat and hat merely to cover a last season's dress. Thus it comes to pass that the friendly cold snap in September gives the merchant not only extra business right at the time but extra business later on.

It is the aim of all retail business to keep trade steady the year round. Naturally, it is not economical to have a rush one day greater than the sales force can handle, and a slump the next day with clerks idle.

Most of this effort to equalize trade is a fight against the weather. At a season when people are not in a buying mood, the merchant inveigles them in with bargain offers. He makes his advertisements fit the weather conditions.

In some lines the natural demand for articles adjusts itself in such a way that there is little

difference in the amount of business winter or summer. For instance, an acquaintance of mine runs a big establishment that sells all manner of musical instruments and utensils. With the coming of balmy spring days music enthusiasts who have been his steady customers for several months begin to seek other diversions. The man who has been exasperating a violin or piano all winter, and buying sheet music or other supplies, promptly loses his musical interest in favor of tennis, golf, or mere aimless personal inspection of the big spacious outdoors. Likewise, the person who had ambitions to make himself a nuisance to his neighborhood by taking vocal lessons, or perhaps, by purchasing a cornet, postpones the step until the following fall. But just about this time various town bands are crawling out of winter quarters. For several months they have done little beyond holding occasional practice meetings; but now they must freshen up and buy supplies for the summer season of concerts on the public square, merchants' carnivals, and rallies of one kind and another. Thus the musical instrument dealer is enabled to maintain his spirit of calm good cheer the year around.

A study of weather and business has its surprises. For instance, restaurant men know that appetites are not the same on a dark, gloomy day as on a day that is bright and cheerful. Natural enough! But the surprising fact is that they eat most on the day that is dark and dismal.

"On a cloudy day," an old restaurant man tells me, "people just sit and eat. There is nothing else to do. On a nice day they eat less and hasten out into the open. But the less they eat the more particular they are about the quality."

A young woman opened a very satisfying little restaurant near the Department of Agriculture, in Washington. Most of her customers are employees of that department. She does a big business every day, but the rush is greatest when the day is the stormiest. On a fine day the men from near-by buildings walk to restaurants farther away, just for the exercise. Those who do not go to other restaurants cut down their eating in order to spend all the time possible in the open air.

No one knows just how much business, even of professional men, is affected by the subtle influence of weather on human temperament. Dentists know that patients are slow to make appointments and quick to break them on cloudy days. A cloudy day is depressing to many persons, and they lack the nerve to face the ordeal of having their teeth cobbled. The same thing that hurts the dentists' trade helps the regular pill doctors. A lot of people whose spirits are dampened by the weather, or whose ills seem aggravated, think that if they go to a doctor and purchase a prescription from him they will feel a great deal better.

Rainy days boost the mail-order business. Because people living in the country—and they

form an important percentage of mail customers—have less work to do when it rains. They are obliged to remain indoors, and they drive away dull care by reading the mail-order catalogue.

Clients in most lines, however, bloom with the sunshine. Architects find that comparatively few persons come in on a gloomy day to discuss building projects. A man owns a building lot, let us say, at the edge of town. On a rainy day he pictures to himself just how the surroundings look at that time and his enthusiasm about the home he is thinking of building, falls below normal. He decides to wait a while.

Go into any hotel lobby or vaudeville house on a rainy afternoon and you will find a good many traveling salesmen who would be busy if the sun were shining. They know that people are not receptive to new propositions when the weather is disagreeable. This is especially true in the selling of bonds, machinery, or other lines which require a good deal of educational effort.

However, the disadvantages of presenting a proposition on a rainy day is offset somewhat by the fact that one may often obtain an audience with a buyer who on a bright day would be so busy that he could not be reached. Many salesmen take the view that it is better to see a man even when he is not in the mood than not to see him at all. Others prefer to wait many months, if need be, to make their first appeal when conditions are just exactly right.

Life insurance agents know that their work is much easier in gloomy weather. People are much more inclined then to appreciate the uncertainty of this life. A big tornado insurance company gets the storm reports from all parts of the country and makes it a point to stir up their agents in any section which has recently suffered storm damage. That brings to mind the case of a windmill agent who by chance elected to work in a locality which had just undergone the calmest season in thirty years. After that he consulted the weather before picking his territory.

A cement contractor in the Middle West became disgusted a while ago at the whims of the weather in his locality. It was freezing cold one day and warm the next. When there was no danger of his work being ruined by a freeze, he had to run the risk of delays on account of rain. It struck him that he would like to live in California, where there is practically no freezing and a long period without rain. But on reflection he decided that he would not care for so much dry weather. He therefore moved about two hundred and fifty miles farther south, to a section which rarely suffered a freeze, though there was a good deal of rain. At about the same time a dealer in building supplies in the same Middle Western town moved to a place a day's journey north, because he believed the colder weather there would mean a demand for heavier and more expensive building material and more of it.

An electric light company in a good-sized city found that while cloudy days caused more current to be used, the gain was offset somewhat by the number of dissatisfied customers when they received their bills. The company then fell into the habit of calling attention occasionally to the unusually large number of dark, cloudy days in a preceding month, and there were no further complaints.

Ice companies sometimes do an interesting bit of figuring based on the thermometer records. They know how many pounds of ice they have delivered each day to a regular list of customers. A certain number of pounds of this ice will melt each day and must be replaced, the number depending upon the temperature. By studying the thermometer at the close of almost any day the company can tell, within a surprisingly few pounds, the amount of ice their customers will require on the day following.

In many lines of business there will be a queer drop or increase for a month because of some unusual weather condition which was not noticeable to the casual observer; a taxicab company did almost forty per cent. more than its ordinary business one month because of rain, and yet there was less rain than usual. It so happened that most of the rain for that month fell along about eight o'clock in the evening, when people in their Sunday clothes were going to the theater or to keep social engagements.

A rainy June is profitable to a big awning con-

cern because of the extra number of awnings that must be erected for June weddings.

Telephone companies increase their force of operators somewhat on a rainy day because of the number of women who remain indoors and seek to drive away dull care by visiting with one another by wire.

As stated in a previous chapter, a windy or a rainy day in New York City alone means a loss of about four thousand dollars to one cigar company which owns a chain of stores, because wind and rain make outdoor smoking unpleasant.

A theatrical manager attributes the failure of a certain excellent piece to the fact that it rained every night of the opening week. People did not like to go out in bad weather to attend a performance not yet an established success, and the fact of small crowds caused a report to get around that the show lacked merit.

Farmers are probably more vitally interested in weather than any other class of people and yet they are surprisingly slow to respond to opportunities provided by the Government to obtain forecasts. Arrangements were made in one locality for a country telephone exchange to give out the official government forecast each day to all farmers who called up and asked for it. Although a great many farmers in that locality had telephones, comparatively few made it their daily practice to ask for the reports.

I heard a lecturer remark that he believes more

women will stay away from a lecture on a windy night than on a rainy night. It is possible for them to keep dry in the rain, but extremely difficult to prevent their hair from becoming mussed up in the wind. With precisely the same temperature and all other weather conditions equal, this lecturer said, more people will come to hear him in October than in May—because in the spring everyone is beginning to resent anything that brings one indoors.

Street-car companies notice that weather affects their gross business much less than in former years; but extreme cold tends to decrease the number of car riders; those—such as women shoppers—who do not have to report for work at a certain hour, postpone their trip. In exceptionally hot weather, the reverse is true, as many ride purely for the relief the rapid motion of the cars gives them.

A traveling man from Dayton, Ohio, once told me that just after the Dayton flood, he was able more than ever before to interest buyers in his line of goods—simply because when the buyer saw the word Dayton on his card he began to talk about the flood, and as the talk progressed the two found themselves on an easy conversational basis which greatly simplified taking up a discussion of the salesman's business proposition. Almost any sudden change or marked whimsicality of the weather has a similar effect, in lesser degrees, because of the talk thus promoted. Anything which encourages conversation between buyer and seller helps business just that much.

CHAPTER X

THE COSTLINESS OF VANITY

In a certain city the leading retail florist has amassed a big fortune by quietly utilizing a funny little phase of everyday human nature. This man charges perhaps thirty per cent. more than any of his competitors; yet much of his stock could be duplicated right up the street for less money. Some of his flowers may be a little better than those sold by others, but rarely thirty per cent. better. They may have a longer ribbon on them or prettier twine round the box, but, on the whole, dollar for dollar, you could get much better value elsewhere.

The main difference is in the selling price. Because he asks more than other dealers for the same article, this man has grown rich. He sells more flowers than any of his competitors and does so more readily. And his success rests to a large degree on the fact that his place is known as the highest-priced establishment of its kind in town.

The young man, who wishes to make a deep and lasting impression upon a beautiful and talented young woman by sending her flowers, likes to buy, if possible, at this most expensive shop. She is flattered to think that he holds her in such high

esteem as to get his flowers at the costliest place in town. And his own vanity is tickled because she now knows—and he knows she knows—that he is able to deal at such a high-priced store.

I do not say, understand, that any merchant can increase his sales by raising his prices; but I do say that, so long as human vanity is what it is at this writing, a great many persons will derive much pleasure from showing their ability to have nothing but the most costly.

One of the most attractive suites in a new apartment house seemed slow to rent. It had more windows than any other suite in the building, but many of these were on the west side, and people were afraid the afternoon sun might make the place too hot. As time went on the suite became more and more difficult to rent, because everybody thought there must be something radically wrong with it or else it would have been grabbed up long before.

The proprietor spoke of reducing the rent for that particular suite. A friend whispered to him that a much more effective plan would be not to lower the rent but to raise it. So the next time he showed that apartment the proprietor said the rent would be five dollars a month more than for any other suite in the building. And he rented it on the spot! The additional cost seemingly not only explained the fact that the place was idle but gave the tenant an opportunity to expect his neighbors to accord special deference to one who

could afford the luxury of a suite costing more than theirs. There is one sex in particular, the members of which are often willing to pay a little extra for the happy privilege of feeling superior to one's neighbors. However, people, while tickling their own vanity, like to feel that they are clever enough to get their money's worth. No one will pay more for a thing just for the sport of spending money; he must get something in return. In the instance mentioned the apartment had more outside light than the others. That gave the renter the chance to square things with his conscience. He was not only spending more than his neighbors, but, he believed, was getting value received.

No one knows how many things are sold for a higher price largely because a higher price is demanded. Almost anybody will agree that if diamonds of the best quality should ever become so plentiful that they would bring only five cents a carat nobody would wear them. And, it is equally probable, if the process of manufacturing imitation diamonds became so expensive that the imitation cost more than the real a great many persons would discard the real for the imitation. They would do so simply to show to the world a proof of their ability to have that which costs the most.

I know a woman—know her well—who went down to the marts a while ago with a lot of odds and ends of jewelry for the purpose of having them all done over and fixed up in platinum settings.

Her explanation was that platinum is a great deal more beautiful than gold—that gold, in fact, is comparatively crass and unlovely. If anybody had suggested that she should wear merely silver jewelry she would have been deeply vexed—almost insulted. Yet silver and platinum look about alike.

Platinum can be alloyed with other metals and made harder than silver, and for some kinds of jewelry this is an advantage. But I have the word of a top-notch retail jeweler that for a great many articles he sells over his counter silver would be precisely as satisfactory as platinum; and the only reason people prefer platinum is because it costs more.

Platinum being more expensive than gold, the wealthy began to use it in preference to gold, because of its greater cost. This, in time, made it fashionable. People who buy it now do so not so much because of personal vanity as because they simply follow custom. But, in the final analysis, vanity is the answer.

Let us consider in this same connection the value of Oriental pearls. Every new crop of fortune makers adds to the demand for fine pearls. When a man has suddenly acquired several million dollars, his wealth is of scant satisfaction to him unless he can let others know that he has it. He desires to have some visible symbol of his financial achievements—just as the Indian warrior wore scalps in his belt, to show that a mighty man he was. But

being of too practical a turn of mind to wish to dress with conspicuous extravagance himself, the new multi-millionaire wears his emblem of wealth by proxy—that is, through the medium of his wife. In this connection she is ordinarily quite willing to give him hearty coöperation. The wife wears a pearl necklace of near-fabulous value, and then the public must recognize that the family has indeed arrived. For they not only have money, but they have so much that they can afford to spend a vast amount of it for something entirely useless.

Even a single pearl of fair size and of the best quality may bring a sum of money that, if invested in Liberty Bonds, would enable a family to live in comparative luxury on the income. I saw a pearl exactly half an inch in diameter, owned by a dealer in New York, for which he had refused $100,000 cash. Understand, he hadn't refused merely $3, or $50, or even the price of an expensive limousine, but *one hundred thousand dollars*—just for that one little pearl. Think of the fun and action one may have with that amount of money and then imagine putting it into a single pearl no larger than a good-sized pea, and with no use beyond proclaiming one's vanity!

Besides this one pearl for which he can get $100,000 just for the asking, the same dealer had six other smaller ones, perfectly matched in size and color. He would have no difficulty at all in disposing of these seven for between $275,000 and $300,000. A necklace with those seven pearls

featured in front, and the others fairly good, would have a commercial value of more than a million dollars!

Worth a million dollars—and yet if you were to immerse the necklace in a little dish of vinegar at night, the next morning your million dollars' worth of property would have dissolved and you would have nothing left but the clasp and the silk thread.

A wealthy widow owned a piece of business property in the New York retail section, worth more than $1,000,000. She sold it, taking in exchange a pearl necklace of similar value. The property had yielded a vast annual income. Not only does this woman receive no income from the necklace, but the cost of the insurance against its loss, by theft or otherwise, is one per cent. of the value or about $10,000 a year. Add to this, $60,000—the interest on one million dollars at six per cent., bringing the total annual upkeep to $70,000. If she wears it, say, twenty times a year, the cost for each wearing is $3500. What else but vanity could prompt a woman to pay $3500 an evening just to be seen wearing an article known to possess great value? Take away this item of vanity and pearls would not bring three dollars a bushel. But, you suggest, they have wondrous beauty. Ah yes, but their beauty is the *excuse* to buy them, rather than the reason. If they were just as beautiful, but so plentiful that they could be had for the asking, it is doubtful if any woman of great wealth would wear them. Consequently

A woman is sometimes willing to pay far more for an article of dress than it is worth, solely because of the satisfaction she derives

they would not be fashionable, and their beauty would be lost sight of. Those who profess to love pearls for their matchless beauty do not admire them quietly at home, or in the safety deposit vaults, but magnanimously wear them to the opera where they may be seen and admired by others. A woman is willing to pay a million dollars for a string of pearls because she gets a million dollars' worth of satisfaction out of letting other women know she can wear so expensive a trinket. It is her vanity that makes the value.

One often hears people complain of an article by saying that, though excellent in its actual qualities, its value is not visible to the naked eye. That makes another problem for those who have things to sell. Showing value is really more important than having value.

I recall a conversation with a woman who confessed to a great love for all precious stones, because—so she declared—of their beauty. She doted on diamonds, but loved rubies and emeralds even more than diamonds. Yet she rarely wore either rubies or emeralds. The reason, so she naïvely told me, was that they were more easily imitated than diamonds and did not *show* their value. So it appeared that her real reason for wearing diamonds was not their beauty so much as the fact that they showed themselves to be worth a large sum of money. They served to let the public know that she was married to a man who could spend the large sum they represented for a needless article.

A miner, when he strikes it rich, usually goes at once and purchases a number of diamonds—not because he wants them but simply to show that he is able to have them. An Alaskan gold miner, once a famous character in that region, sent to Seattle for one of the finest big automobiles available. He had it shipped to him up the river into the interior of Alaska. There were not two miles of road in his locality suitable for a big automobile. Before he had owned the machine a week he drove it into a big snowdrift and there abandoned it. He had already accomplished the object of its purchase—to prove that he had enough money to buy himself an automobile.

Long ago, so the story runs, a piano manufacturer chanced to discover that a great many persons bought pianos not so much for the purpose of producing music as to have a piano in the parlor as proof that they could afford such luxuries. In other words, they had a piano because it was considered the proper thing. Up to the time the manufacturer stumbled on this little human trait, he had been putting most of his effort into the tone of his instruments. But he began to work on a different plan. Though still putting out a fairly good piano as to the inside, he took particular pains with the exterior. He searched for wood having a pretty grain, and used the best varnish and the best workmanship in applying the varnish that he could find. Then he raised the price—even though his manufacturing cost was less than

ever before. His sales showed a big increase.

In almost every town there is a conspicuously big home, belonging to one of the town's richest men. One of the first impulses of a man who finds himself rich is to build a home much larger than his tastes and the size of his family require. First one and then another of the rich men of a community build larger houses than they need, each new one trying to outdo the others a little, in order to have a proper monument to the owner's position as Prominent Citizen. Such homes are often more expensive than beautiful and suggest a public institution, or Machinery Hall at a world's fair, rather than simple domestic comfort.

On the other hand, when a person has been known to be wealthy for a long time, so that there is no longer any need for outward demonstration of the fact, the person usually ceases to wear many diamonds. Once display becomes too common those who can afford display go to the other extreme and leave it off entirely. This is true not only of people but of institutions.

One of the most prosperous department stores in New York has no name on its building. Unless you are familiar with New York you would probably have to ask somebody before you could learn whose store it is. The idea is that, because most stores have elaborate electric signs, this old institution wishes to impress the public with the fact that it does not need such devices. It does, not have to wear diamonds. Any store can have

a big sign, but only a few can be so well established as to get along without any name—not even on the doormat.

Practically everything that is fashionable in dress is so because of its expensiveness. The main requisite of a new style is that it be costly in material, workmanship, or design. It must be enough unlike the style of the preceding season to entail a certain amount of wastefulness—that is, items of dress still on hand, and not worn out, must be made comparatively worthless. The reason for all this is, of course, that those who seek to set the fashions usually wish, incidentally, to reveal their financial status—their ability to buy whatever they want.

A few years ago there came into fashion a certain kind of fur. This fur comes from a very small animal and it takes hundreds of skins to make a good-sized cloak. These must be sewed together carefully, which means a considerable labor cost, and with so many seams all over the coat, the garment cannot be durable. It tears easily. Moreover, the fur is short and readily wears away. The woman who buys such a coat does so knowing that she cannot wear it longer than one or two seasons. Yet she pays a price that ought to provide her with all the fur she needs for the rest of her life. Looking at it from the viewpoint of efficiency and common sense, such a coat is an unwise purchase, but it has this advantage: everybody who sees a woman in such a garment must know that she has

a certain amount of financial standing, or that she possesses sufficient personal attractions to have caught a mate who has financial prowess. Therefore, the assumption is, she must be entitled to a certain degree of deference.

As I have already remarked, a husband frequently encourages his wife to dress expensively, because to have her do so appeals to his own vanity. He likes to sit down and think to himself that he is able to maintain a wife who wears the best. Saleswomen behind the lingerie counters know that men, rather than women customers, are the ones most likely to pay the topmost prices for such finery.

At one time women's skirts were built to drag in the dust. The practice was based on the notion that the wear and tear on a skirt as it dragged over the sidewalk showed an opulent disregard for expense, and that such disregard was extremely smart and clever. But the style was so insanitary that even its expensiveness probably could not make it fashionable again.

Short skirts always prove a boon to manufacturers of shoes and stockings. Every time fashion has taken an inch from the length of skirts, shoes and stockings have become just that much more conspicuous, as you might say, and women have felt the need of having these articles correspondingly more expensive. A shoe manufacturer was once quoted as saying that two inches added to skirts would cost the shoe manufacturers of the United States fully two million dollars a year.

And here is an odd thing about shoe prices. We must pay more for shoes, we are told, because of the high cost of leather. But a pair of woman's shoes made of satin cost nearly as much as if they were made of leather. The answer is that if the satin shoes were priced much cheaper, no really fashionable woman would buy them. She would fear that some friend or servant might think she selected them solely because of their smaller cost.

A woman of my acquaintance remarked one day that on the following Monday morning she was going to buy herself a fine new shirt waist at a cost of thirty-five dollars. She went on to say that she had no particular waist in mind, but that she had decided on an expenditure of thirty-five dollars in order to acquire the kind of waist she thought she ought to have.

One of her woman friends mentioned the fact that a big store was having a sale of waists, and that it was possible to buy a thirty-five-dollar waist for as little as twenty-two dollars and eighty-five cents. But the first woman was still determined to spend her entire thirty-five dollars for a waist; in fact, she seemed rather disappointed that they had been marked down.

The point is that she had come to a state of mind where she believed a thirty-five-dollar waist would be a symbol of her financial and social status. She felt that she could afford thirty-five dollars for a waist, and thirty-five dollars was what

she intended to spend. The fact that she could get a waist which would be plenty good enough—neat, stylish, and attractive—for only fifteen dollars did not matter. Too many other persons could buy one at that price. She desired something more or less exclusive.

That word exclusive, by the way, is one which business men who know human nature use a great deal. One can scarcely look into a shop window without seeing something that, according to the label, is intended for a person of exclusive tastes—for the man who feels at home only with the very best. Nearly everybody who reads the label knows that he himself is a person of discriminating and exclusive tastes, and he is prompted to go in and buy the article. If he is a man of considerable wealth, perhaps he will not buy it unless the price is high enough to place it beyond the reach of the average purchaser.

The manager of the musical department of a big store showed me one day a lot of instruments priced to sell all the way from five to twenty-seven dollars. The twenty-seven-dollar instrument cost the store only about three dollars more than the one they offered for five. It could have been sold at a reasonable profit for seven dollars; but the manager knew the department had certain customers who would not take seriously any instrument costing so little.

People who can afford to travel usually think that even the sunsets in distant parts of the world

are more beautiful than those to be found in any of the favored spots of their own country. They figure that they must be better because they cost more to see.

Most people have a detestation for the thing called commonness. People often declare that a certain kind of cloak or a certain kind of automobile is all right, only it is too common—that is, too many other people are capable of owning the same thing. When too many people can buy a thing there is little distinction to be gained from having it.

People are willing to pay more for a set of books, if they are of a special, numbered, limited edition. The merit of a book is not really injured by the fact that a limitless number of other persons own one like it, but there is nothing exclusive or distinctive about having such a book.

Here, let us say, is a hat costing fifty dollars in a so-called exclusive millinery establishment. It is made of high-grade material, is artistically put together, and is really a beautiful piece of work. Along comes a society woman, who tries it on and declares that it is a dream. She buys it. Then she discovers that cheap imitations of the same hat are being worn by humble shopgirls. Instantly the hat ceases to be a dream and becomes a nightmare. Yet in itself the hat is just as beautiful as before. Its charm is gone because it has lost its distinctiveness—its unattainableness.

This craving for distinctiveness is an odd phase

of human nature. In order to make himself seem unusual a man will boast of things of which he really should be heartily ashamed. I have heard men brag of the fact that they cannot eat onions, or cucumbers, or rare beefsteak, without ill effects; or that they are afraid of cats.

If they cannot eat things or do things that other people can, it is a defect, a weakness on their part; but they like to talk about it, because it singles them out from the crowd. They think the onion or cucumber exclaims:

"Aha! Here is no ordinary person. He is different. He can't handle us!"

Big stores and little stores are constantly obliged to figure on this human tendency on the part of the very rich to excite the envy and emulation of those not so rich, and of persons in the humbler social ranks to imitate those of higher status. There is an effort all the while, on the one hand, to produce expensive goods of a kind that cannot be imitated in cheaper quality; and an effort, on the other hand, to do that very thing—to provide for the shop-girl an imitation which will enable her to give the impression that she can dress as well as the wealthiest society leader.

One may observe, too, that most stores, whether dealing in jewelry or groceries, do not aim to make an appeal to all classes of buyers. They seek the rich, the near-rich or medium class, and the so-called common people. Somewhere there will be a line of demarcation. It is rarely that one

store seeks both the very rich and the humble. And there is a reason for this. It is not because the various departments could not be so arranged as to suit everybody, but that the very rich object to dealing at a store where they come too much into contact with people not of their own sort.

The jewelry store, for example, which bids for the trade of the very rich, prices its goods high enough to bar the humbler buyers of jewelry. Then the wealthy seek the place all the more readily because an article from that store carries with it the idea of expensiveness and exclusiveness and high quality.

I have in mind a big store that sells chiefly to people of the humbler classes, but always has at least one window filled with ultra-expensive articles. They will have a gown labeled, say, two hundred and seventy-five dollars, and worth perhaps every cent of it.

Now, if a woman was going to pay that much for a dress this store would be the last place in town she would think of looking for it.

Yet it pays them to carry a limited amount of high-priced goods in stock to exhibit in their windows; for it pleases the humbler customers to know that they buy their clothes at a place which handles two-hundred-and-seventy-five-dollar gowns.

A hotel man once said to me: "We charge high prices, not only in order to be able to buy the best quality of food obtainable but so that we may

obtain the trade of the wealthy business men, who like to show that they have the money to eat in a place where things are so costly."

I stopped one day at a little country inn where the charge for a chicken dinner is three dollars. One can get just as good a dinner at other places for a dollar and a half but the high charge seems to give people a desire to eat there. The man of wealth who wants to do something clever would rather take a party of friends to a three-dollar meal than to a one-dollar meal, even if the food were the same. It is something to have eaten a three-dollar meal when equally good ones can be had for less money.

A friend of mine has an automobile with a top over the back seat, but not over the front seat. When it rains the front seat gets wet. However, he has another car to use on rainy days. I am certain the reason he bought an expensive car with no top except for the back seat was to show that he can afford a car for rain and another for fair weather. He feels that it helps his position in the community.

And one sometimes sees automobiles with two men in livery on the front seat. Certainly there can be no reason for a footman on an automobile except that this affords the opportunity to exhibit one's ability to pay for such unnecessary luxuries. In the days of horses and carriages there may have been some semblance of need for an extra man to help around while the driver was holding

the horses; but it is fairly obvious that a chauffeur, after stopping his car, can get out and open a door or arrange a robe without losing his union card and without undue strain on his faculties.

A few years ago collars of dark material to match one's shirt were in vogue. These collars saved laundry bills. They should have been especially desirable, one would think, in Pittsburgh. A haberdasher from that town told me he couldn't sell them at all. His customers were all afraid he might think and that their friends might think they bought colored collars as a matter of economy.

Most of us, if we were obliged to live in Pittsburgh, and were sensible, would not undertake to wear white kid shoes. Yet white kid shoes are sold there about as readily as anywhere else. In fact, there is at least one man there who buys white shoes lest somebody should think the reason he did not buy them was because of the upkeep—lest somebody should suspect that he is not making any more money than he is making.

The other day I was talking to a hotel proprietor I had known when he was head waiter in another hotel. After complimenting him on his thrift and enterprise in getting a place of his own, I asked him how he got the money.

"It's vanity money," he replied.

And then he went on to tell me some things about tips, from the head waiter's viewpoint. There are two main reasons why a man tips a waiter: First, because he fears the waiter may

think ill of him if he doesn't; and second, because he wants to impress those about him. It is all a matter of vanity. When a man tips a head waiter persistently enough the head waiter scurries after a suitable table when this man enters the dining room. Other diners notice this and the man knows they notice it. He is flattered.

Then, he likes to lay out substantial tips for the waiter and head waiter if he has friends at his table—especially women friends—so that one and all may appreciate that he is no so-called piker. That is why it is practically impossible to stop tipping—because there are always persons anxious to pay for the proud privilege of being noticed. So it goes. Vanity, vanity, everywhere!

CHAPTER XI

HABITS OF THE SHOPPER

DEPARTMENT STORE managers once viewed with grave concern certain revolutionary tendencies of the times with regard to underwear. People were wearing the same weight of underwear the year round. They bought light-weight stuff for summer and made it do all winter. The idea was that extra warmth needed for outdoors in winter had better be in the form of garments easily removed on coming into a steam-heated building. Somebody had cleverly discovered that it is much less of a nuisance simply to take off a heavy overcoat on entering an overheated home than to change one's underclothes.

And so it came to pass that comparatively few persons flocked to department stores for special seasonable outfits of underwear in spring and fall. In a short time the department-store men found that the change in underwear sentiment, instead of proving a curse to retail business, was indeed a great boon. It not only spread underwear sales over the entire year but it greatly increased the total sales. For the light underwear now worn lacks the prosaic durability of the red flannels of other days.

Moreover, in the case of women's goods, the garments are more attractive and there is more incentive for the customer to spend her money for them. There is only a scant amount of romance about a set of plain, unfrilled, old-fashioned woolen underwear; but the woman who sits before her dressing table preening herself, while all fussed up in the various articles of lace and frills that she puts on to-day, is quite likely to look so cute and chic that she is not a little pleased with herself. So long as the effect is gratifying to the eye she is willing to spend twice the sum she formerly devoted to garments that merely kept her snug and warm.

By means of advertising and by offers of good values, big stores are able to change a dull month in any line to the biggest month of the year. For instance, August is naturally the worst month out of the twelve in which to sell furs. Comparatively few persons feel the need of a muff or a sealskin cloak on the average August day; yet I know of at least one mammoth department store where more furs are sold in August than in midwinter. It is done by means of a Great August Advance Sale of New Furs, priced so attractively that buyers are coaxed to overcome their natural aversion to buying anything not yet needed.

The same is true of furniture. Nobody really wants much new furniture in summer; but many stores sell more furniture in August than in May or October. The Great Midsummer Furniture

Sale does it. By giving enough reduction in values to make it an object, the stores coax men and women to buy several weeks or months in advance of the natural impulse to do so.

It is the ultimate goal of stores so to modify human nature that trade will be of approximately the same volume the year round. In most places the Christmas-shopping period is now forced under way as early as the middle of November.

A department-store manager can bring about more or less of a rush in almost any department any day. He can have attention called to his soda water in a way that will cause almost a riot at the soda counter the next day, even though the soda is just the same as has been sold there right along. It is simply a matter of obtaining the most results from an advertising appropriation. There is just so much money to spend in the course of a year, and if the manager lays too much stress on soda water he has less money to buy space in which to tell of bargains in women's cloaks or hosiery.

While women's cloaks are likely to comprise the most profitable line of goods offered in a big department store—for the amount of floor space occupied—in certain establishments the leader may be millinery or something else. I know of one big store where it is shoes. This does not mean that the shoes there are any better or any cheaper than at rival stores, but is simply due to the fact that the merchandise chief used to be at the head of a shoe department and has a habit of pushing the shoe trade.

Many big stores charge various departments with their proportionate share of advertising space used in the course of a year, just as they charge them with their floor space. The same plan is applied to space in the show windows.

Styles in advertisements have changed a great deal in the last few years. Exaggerated statements and superlatives are no longer popular. A merchant does not set forth that a line of overcoats at twenty-one dollars is the greatest cut-rate offer ever placed before the public of any nation since the dawn of the Christian Era. He is more likely to state simply that he has overcoats at twenty-one dollars which he thinks are well worth the money, and of a style that cannot be duplicated elsewhere.

Understatement has proved to be better than overstatement. This has been discovered in other lines entirely apart from selling goods. A former United States Senator, famous for his oratory, made great use in his speeches of the trick of understatement. If he wished to accuse a man of being a thief—a man everybody knew had stolen at least a million dollars—he would aver that he had every reason to believe that the man had appropriated not less than two dollars and a half.

Years ago there was a hotel proprietor out in Carson City, Nevada, who hit upon the efficacy of understatement rather than boastful exaggeration in his advertisements. His hotel did a thriving business, much of which was directly traceable to

his scheme of making his claims modest and plausible. One of his advertisements appeared in the *Appeal* of Carson City along about 1889, and was substantially as follows:

ARLINGTON HOTEL

Worst Hotel in the United States!

Homely chambermaids, coarse inen, dingy halls, bad ventilation. The cooking disappoints everybody. Jockeys come here to reduce weight. I carry only average wines and liquors.

But my cigars are fairly good, and I can sell you one accompanied by the pleasantest kind of a smile.

OLIVER ROBERTS, Proprietor.

The method of presenting an advertisement varies greatly according to the kind of store. If it is a store that caters to the so-called highbrow trade, the advertisement may be in the form of little editorial-like discussions of values and seasonable offerings. But for a store that seeks the trade of the masses there is nothing so compelling, nothing so full of appeal and logic, as the simple statement: "Was $18; now $11.95!"

Every department-store manager must deal constantly with human nature in a big way, both as to individual and aggregate traits. For example, there is the bargain-sale feature. It is not mere chance that frequently places these on Monday. The merchandise man knows that more housewives have remained away from the shopping

district on Sunday—naturally—than any other day in the week. Therefore they are more in the mood to go shopping on a Monday than on other days.

However, there must be some inducement, because only two days previous was Saturday—pay day—and a great many women have satisfied their shopping desires with their share of the money in the little yellow envelopes. They are willing enough to visit a store on Monday provided there is an excellent bargain reason for drawing from a pocketbook already flattened somewhat on Saturday.

The store manager goes further in making capital of human nature on bargain day. Not always does he place his counter of advertised bargains near the front entrance. More frequently it is at the rear, and the route to it takes one along aisles bordered with various other lines of tempting merchandise. In one store, soap is offered occasionally for even less than cost. But eager customers, standing in line on the way to the soap counter, find themselves face to face with tempting displays of potted ham, olives, and other delicacies, samples of which they are invited to eat before proceeding further. Now, these articles are especially palatable when eaten by a weary shopper in the midst of a bargain day rush. They taste so good, in fact, that a certain percentage of the people in line—a percentage which the store managers know in advance—buy some to take

home. And having got started, in this way, on new lines of groceries, many customers repeat their orders. Thus does the store make a substantial profit, indirectly, from the soap that it sold for less than cost. Moreover, those who buy only the bargain soap go away subconsciously associating that store with the idea of big value for one's money.

The number of persons attracted to a store by an advertisement depends in a large measure on the size of the advertisement and the way it is presented. Advertising managers sometimes boast of their ability to make the public respond to their art with scientific precision.

"How much business do you want to do in your department to-morrow?" I once heard an advertising manager ask a department manager. "About four thousand dollars? All right; I'll frame an ad. accordingly."

That, doubtless, was mostly big talk; and yet it stands to reason that after long experience a man can learn approximately how large an advertisement will be necessary to draw enough customers to a department to make four thousand dollars' worth of sales. It is obvious, too, that this would be true only within certain limits. A certain size advertisement might sell ten thousand dollars' worth of furniture, and one twice as large might not sell another dollar's worth. Yet the space occupied by an announcement of bargains in merchandise counts for a good deal. More persons

will heed a notice occupying an entire page in a newspaper than one which takes up only an inch or two in one column; and this would be true even though the smaller advertisement were seen by just as many persons as read the larger one.

The advantage of enticing a large number of persons to a store by special bargains is not only that a greater amount of business will be done, but the managers can forecast more accurately than with a smaller crowd what effect the extra rush of customers will have on various departments. For the greater the mass, the more definite is the operation of the law of averages, and the easier it is to tell in advance what ratio of the people will buy a certain thing or do a certain thing.

In almost every store Saturday is the busiest day of the week, and the quietest days are usually Tuesday and Wednesday. The reason for the big business on Saturday is doubtless due to the fact that Saturday is pay day; the buyer has the money to make a purchase and wishes to satisfy, without further delay, a week-old desire for a given article. Tuesday and Wednesday are comparatively dull because they follow Saturday, the big buying day and Monday, bargain day.

Friday, also is a good business day. Many stores have their main bargain offers on Friday. Another reason why Saturday is busy is, of course, that people stock up with things they will wish to use over Sunday. In summer, department stores usually display sporting goods in their windows

on Saturday, because men are facing not only a Sunday free from business cares but perhaps a Saturday afternoon half holiday. The manager of the musical department of a big store was telling me that most violin and guitar strings are sold on Saturday. On the other hand, he said, for some reason music teachers buy most of their sheet music on Monday.

This same department manager noticed a number of other odd human traits. Whenever a grown man buys a mouth'organ, jew's-harp, kazoo, or tin fife, he almost invariably makes it a point to remark that is for his little boy, or somebody else. Men feel apologetic over their ambition to play on certain types of musical instruments.

Another thing: a father who says never a word about paying two hundred and fifty dollars for a piano for his daughter will dicker a long time when buying a violin for his son before paying a dollar or two more for a better instrument—this regardless of whether the boy shows twice the promise, musically, that the girl does. The reason seems to be that father feels he must buy a piano for the parlor anyhow, to be conventional; but the violin is an added expense that he hadn't been counting on, and that will not add noticeably to the dignity of his home surroundings.

More goods are sold in big stores in most of the larger cities at about four-thirty in the afternoon than at any other time. A good many women shop in the forenoon, but a much greater number

look after household duties in the morning and do their shopping in the afternoon. Along about three-fifteen there are more women shoppers on the street, or looking about the various departments of the stores, than at any other hour; but they are doing more looking than buying. They wait until just prior to going home before finally making up their minds; and that is why the crest of the buying wave is reached at from four-twenty to four-thirty. After that they have barely time to get home and prepare dinner before six o'clock.

There is another buying wave, but a smaller one, at five o'clock, due to the crowd of women who come out of theater matinées. In the departments selling such articles as pastries and candies, the biggest rush of the day sets in around five-thirty. And the buyers are more largely men than was true earlier in the day. They have received orders from home to bring along some cakes for dinner, or have been moved by some worthy saccharine impulse to stake the family to a box of candy.

A man almost invariably buys such things just before starting home, partly because he doesn't like to lug his purchases about with him any longer than necessary, and also because it is a man's tendency, more than a woman's, to postpone a purchase until the last minute. Women are twitted a great deal in the comic magazines and joke columns about being late; but every man knows that it averages the other way and that man is the procrastinator. Go into any big store just before

closing time and note the sex of the shoppers who are rushing madly about after articles they really intended to buy much earlier in the day.

Across the street from one of the largest department stores in New York is a successful dry-goods establishment that few New York shoppers know by name. The place is advertised only modestly, is unobtrusive in appearance, and if you went by the store you would wonder—if you noticed it at all—how the concern manages to keep going, especially in the face of the competition of the vast establishment on the other side of the street.

The answer is that, except for the big store, the little store could not exist in that location. It would either have to move or suspend operations. Without the big store it would be like a side show with no circus to attract the crowd. As it is, the smaller plant probably makes a bigger profit for the amount invested than its overtowering competitor.

Do not get the impression, either, that the smaller store gets merely the overflow from the big one. It specializes somewhat in certain lines in which it is able to give good values, and shoppers like to inspect its stock. Frequently they spend more money there than in the larger place across the way. But the point is that if the big store were not there, with its greater variety of attractions, people would not head toward the smaller establishment for itself alone. The locality is away from the main shopping center and would be

almost dead for retail purposes if it were not for the big department store on the corner.

Suppose, on the other hand, that both stores were big institutions—one about as big as the other. Would not the competition be so severe that each store would earnestly wish for the other to move? It would not. On the contrary, so long as the two stores are in operation in the same city, it is better for each that they should be close together—the closer the better. One helps the other. Each establishment has customers who would rather buy there than elsewhere; but if there is a chance of getting better values at another place next door they will look over the goods there before buying. In that way each store helps its neighbor to draw a crowd, and out of the number who drift in from next door many will be moved to make purchases they had no idea of making when they left home. Buying is stimulated. The management of almost any first-class big store has implicit confidence in its ability to beat, or at least to equal, its competitor in giving good value, and is willing to have customers make comparison. Where it loses in one department by having a rival close by, it gains in another.

I have in mind two big department stores in a great Middle Western city, which stand almost side by side. One may be known as March's, the other as Boley's. Said the manager of March's store a while ago:

"If Boley's should ever have to move because

the building owner raises the rent, I should almost be disposed to pay the difference in their rental out of our own funds, if necessary, to keep them close by."

And I have no doubt the manager of Boley's feels the same way.

If you have ever had occasion to buy a piano the chances are that you found most of the piano stores in the same part of town and fairly close together. When a man starts to buy a piano he wants to examine every line in town if he can do so conveniently. But he may not bother with the dealer who is too far from the others.

Much the same condition is true of automobiles, typewriters, jewelry, and other articles. Maiden Lane in New York is a hive of wholesale and retail jewelry establishments.

On the other hand, in selling small articles like cigars or candy, too much near-by competition is obviously an objection. People passing a given location buy just so many cigars, and if they divide their purchases between two stores neither store does so well.

I was speaking, a few lines back, of March's and Boley's department stores. March's offers a much more attractive line of merchandise, and people in that city often wonder how Boley's can withstand such competition. Yet Boley's is a big moneymaker. The answer is that Boley's caters almost entirely to the laboring classes—people who pay as they go and do not indulge themselves

in such luxuries as charge accounts. Boley's store carries a line of goods to fit the buying capacity of these cash customers. Most of them are so accustomed to proceeding by their own effort that they usually do not even think of asking to have goods delivered. They pay on the spot and carry their own purchases home. And the habit is one that Boley makes no effort to educate people out of; the saving in cost of delivering goods—even apart from the fact that a big proportion of the business is on a cash basis—is an important item.

One winter when business was dull and many men were out of employment, the proprietor of a certain big store began making displays of skates and laying unusual stress on his skate bargains. One of his assistants laughed at him and said:

"When men are wondering how to get enough to eat they aren't going to spend their money for skates."

The proprietor knew, however, from previous experience with human nature, that a winter of industrial depression helps skate sales. Men who are out of work and have leisure hours forced on them figure that they are better off skating than sitting about an insufficiently heated home feeling sorry for themselves. If they are not earning anything they are at least improving their health and increasing their capacity for work when it does come.

Merchandise chiefs of chain five-and-ten-cent stores have great opportunity and necessity for

knowing the quirks and traits of human nature as it crops out in various sections of the country. They know that what will sell in one State may go untouched in another.

For instance, it is practically impossible to sell a stock of mops in certain parts of Pennsylvania, and equally difficult to dispose of scrub brushes in New York. But if the two stocks were switched, and the prices are reasonable, both the mops and the scrub brushes would soon be sold. The reason is that women in certain parts of Pennsylvania have believed for several generations that a floor is not really clean unless it has been scrubbed by someone down on the knees with a brush. In New York, on the other hand, housewives have been brought up to think that such work is too arduous and needless.

The heads of a chain of these five-and-ten-cent stores must keep close watch on styles—not all styles, but those that affect articles they have to sell. If a popular actress changes her hairdress, the five-and-ten-cent stores must anticipate the result by having whatever is needed in the way of hairpins and back combs.

One season, a wave of simplified hairdressing started in New York and swept across the continent into the homes of rich and poor alike As the style made its way westward, the chain-store company could see its hairpin sales falling off in one State after another. They had known in advance that that very thing would happen, and

had cut down their hairpin orders even before the ultimate consumers did.

Stores that sell high-grade goods at fancy prices are constantly on the *qui vive* lest a cheap imitation of some expensive novelty should be offered in the five-and-ten-cent establishments.

A few years ago a woman dancer bobbed her hair. For some reason, hosts of young women had ambitions to look like this dancer. The more foolish ones cut their front hair. Others were saved this sacrifice by a hair-goods concern, which got up a false bob. A big New York store arranged to push the sale of this hair-bob, which was to retail at five dollars. Before the goods arrived the five-and-ten-cent stores got the same thing, only with a much cheaper grade of hair, which they offered for twenty-five cents.

CHAPTER XII

INGENUITY IN SALESMANSHIP

ANY observant person must have noticed that a big improvement has crept into the selling end of most retail businesses in the last few years. Men who sell goods from behind the counter are vastly more clever salesmen than one used to find. There are many men working behind counters who, though obscure-looking, are so efficient in their quiet way that they can earn four thousand or five thousand dollars a year. They do it by selling rapidly.

A poor salesmen, working on salary and commission behind a hat counter, for instance, used to take so long to sell the average man a hat that his total commissions at the end of the year were small. But to-day, if you go into a high-grade store to buy a hat, or a suit of clothes, the chances are that the first hat or suit the salesman shows you is the one you finally buy. There will not be any need to look much farther. The salesman, if he is a good one, sizes you up and knows just about what you want. If you have on a black felt hat he may assume that you want a change and will show you a hat of lighter color. If you have a full, round face

he does not show you a hat with the kind of brim that would overemphasize the full-moon effect. And he is careful not to insult you by showing you a hat much cheaper than the one you have been wearing.

"Let's see," says he, reaching out for the hat you have on; "what size do you wear?"

While you're telling him that you wear a seven-and-an-eighth, he is turning back the sweatband as if looking for the size; but in reality he is looking for a price mark and taking an inventory of the general quality of the hat.

If he showed you too cheap a hat you would not only feel somewhat insulted but would question his ability to find anything in his stock to satisfy you. It would be apparent that he was simply showing you hats at random. Offering you too expensive a hat would also be a mistake, as it would make you feel uncomfortable—as if you had got into a store out of your class. You would decide that they took no interest in the wants of the humbler customers. The smart salesman gives out the impression that the kind of hat you want is the very kind they make a specialty of—the kind they find most pleasure in selling.

Time and again I have gone into a store and bought the first hat the man showed me. I had learned by experience that if I took time to look at others I should probably prefer the first one anyhow.

It used to be that buying a suit of clothes was an afternoon's job. First, it took a long time to

find a suit that would fit. Then, you discovered, the suit which satisfied you in that respect was too high-priced, or too loud in pattern. To get all the desirable qualities in one suit required a lot of looking and a lot of wearisome trying on. And, from the store viewpoint, it was costly—because it required more salespeople. To-day a good clothing salesman is supposed to have enough intuition to know at a glance just what the customer's wants are, and to know his stock so well that he can go at once and lay his hand on the very suit the customer will buy.

It is the same way with shoes. Instead of hauling out nineteen varieties of shoes and getting you all confused, the clerk guesses about what shape you want. Or perhaps you have told him what number in the window display most appealed to you. And, instead of asking you for your size, the clerk measures your foot.

In the case of a woman customer this is particularly wise, for a woman will often try to make herself think she wants a smaller shoe than she ought to have. Then her feet are uncomfortable and she nurses a feeling of malice toward the shoe store. The clerk knows that the size one's feet can be comfortable in will vary somewhat according to the width. So he goes quietly and picks out what the woman ought to have, while she is quite content in the assumption that he is picking out a much smaller size than he really is, and that her feet are dainty to a wonderful degree.

It frequently happens that one can buy the same shoe at a lower price in one store than in another; but nearly always there will be a difference in the service, to offset somewhat the saving in the shoes. In other words, the tendency is that service and value in different stores will average up about alike. You go into a high-priced store and usually a clerk comes at once to wait on you, and stays faithfully with you until the ordeal is over and you have made up your mind which pair of shoes you will make your own. But you enter a store down the street, where you can buy the same shoes for, say, a dollar less, and the chances are that one clerk will be waiting on about six people, hopping from one to another like a Swiss bell ringer. He takes off one of the new customer's shoes at once—so that if the customer gets tired of waiting he won't leave. Then, as soon as he can get round to it, he hands the customer a shoe, to keep him interested—a good deal like giving a restless child a toy with which to amuse himself.

This type of salesman is often a real artist in his line, and it is surprising how rapidly he can dispose of a whole benchful of buyers. He does it by giving each customer the shoes he wants with the least possible delay. If he had to yank down half the shoes on the shelf for each person, in the old-fashioned way, there would be chaos.

A smart salesman behind the underwear counter is quite likely not to ask a man what size he wears, but to pull a tape from his pocket and breezily

take the measure of the customer's chest and waist. Then, keeping his own counsel, he fetches garments he thinks will meet the customer's requirements.

In the first place, not one customer in ten remembers his underwear size between purchases. If he thinks he wears a thirty-eight undershirt, when he really needs one of size forty, he will either be dissatisfied with the shirt—and the store—as long as he wears the garment, or he will try it on at home and then bring it back to exchange for something else—all of which means a certain amount of effort and annoyance and expense on the part of the seller.

On the other hand, if the customer does remember his size, and the salesman finds that it isn't in stock and offers him something else, the customer is certain something else won't do. Yet, another size might fit equally well. For instance, a man who has been wearing a closely woven undershirt, size forty, can easily make out with a ribbed shirt of size thirty-eight. Or he may be right in between thirty-eight and forty, and one will do about as well as the other. So the smart clerk knows that it is best to ask no questions and go right ahead in his own way.

However, there are still a great many salesmen who entertain ideas and tastes I should hesitate to adopt for my own use. It has always seemed to me that the world's worst salesmen are sought out and placed behind the shirt counters throughout this broad land.

For instance, it happens that I like to wear negligee shirts of a rather subdued, unobtrusive pattern, so that I may move among people of high or low degree without their being harassed by my shirt's acoustic properties. Yet, whenever I go into a haberdashery to buy shirts I am waited on by a young man who seems to have consecrated his soul to selling me something I do not want. He shows me a lot of shirts with color schemes that seem to have been designed to combine the attractiveness of a horse blanket and a bright new drug-store awning.

Haberdashers always seem not a little vexed when I fail to enthuse over shirts suitable only for minstrel parade and cakewalk wear. With a shirt on like that I should be haunted constantly by the fear that I might meet somebody I know. Frequently a spry young shirt salesman gives me a pitying glance, such as one bestows upon idiots and like people, opens up his vest, and proudly shows me that he himself is wearing one of the very patterns to which I have objected.

Once I went into an antique shop to look at a chair. The clerk was out for the moment and a colored porter kindly undertook to wait on me. The chair I had seen in the window proved to be not quite what I wanted, but the colored man was anxious to please his employer by making a sale. As a clinching argument why I should buy, he said to me in a confidential tone:

"I've got a chair about like that in my own parlor!"

The practice of mentioning a clerk's own preference or fondness for a given article is now considered, as they say in vaudeville, "old stuff." I know of one great department store which carefully instructs its saleswomen in the ready-to-wear departments that they must not, under any circumstances, say to a customer: "I like that on you," "That looks swell," or any such volunteer comments.

The fact that a certain type of salesgirl likes a garment might appeal to some customers as a good reason for not buying it.

This same store insists on just the right phraseology between a clerk and a customer—not only for the sake of courtesy but for greater efficiency. For instance, a clerk must not say to a customer: "Are you being waited on?" but, "Did you find what you wanted?" The latter form of inquiry has the advantage of applying to two different contingencies and the former to only one. It is drilled into clerks in this establishment that customers and possible customers in the store are the company's guests and must be treated as such. Those who look but do not spend must be made to feel that it is perfectly all right to do that very thing.

"We spend thousands of dollars every year in advertising," remarks the head of this concern. "These advertisements are invitations to the public to come in and see us—just as much so as engraved cards are invitations to a reception in

one's own home. Having invited a person to see us we must make him feel at home when he comes."

Before the child-labor laws were in such general effect over the country, department stores used to take very young girls and train them gradually so that they absorbed the atmosphere of salesmanship by easy stages. To-day salesmanship is taught to inexperienced employees more by talks and class instruction. It often happens that a person who is not naturally a good salesman will be kept and encouraged because of some qualities which make a good foundation for the actual technic of selling.

A girl whose mental processes are a trifle slow—but who is especially tactful, has a courteous manner, or limitless patience—may in time make a high-grade saleswoman.

A few stores of the better class aim not to employ any girl who has blondined her hair, because of a theory that, inasmuch as blondined hair is a faked article, a customer may unconsciously associate the idea of faking with the goods sold over the counter.

Be that as it may, no doubt there is a prejudice against blondined hair on the part of a lot of people, which might tend to detract from a blondined salesgirl's usefulness. I heard a store manager jokingly bewail the fact one day that his best salesgirl in the cloak department had peroxided her hair.

"I have a notion, after this," says he, "to hire nothing but brunettes."

One of the disheartening things, this same man told me, is that girls whose characters are perhaps not entirely above reproach often make the best saleswomen. They have a kind of *savoir-faire* and an insight into human nature that prove valuable.

The tendency in all lines of selling to-day is away from the so-called "trick stuff." It is dangerous to fool a customer into buying anything, no matter how meritorious the article may be. On the dining cars of a well-known railroad the menu cards used to carry both at noon and in the evening, a line, stamped on in red ink: "Special Chicken Dinner To-day, $1.25." Then the dining-car conductor called attention to this line, remarking casually:

"We have a special chicken dinner to-day. Very nice!"

Now the idea was to convey to the customer the impression that here was something out of the ordinary. The day before or the day after, or maybe any other day in the year, he might not have an opportunity like this to buy a special chicken dinner on the dining car at a flat rate. Yet that identical special chicken dinner was on the menu of that railroad twice a day—for both dinner and supper—every day in the year, including Sundays and Arbor Day.

Many persons never would buy that special dinner, no matter how much of an inward craving they had for chicken, simply because they thought there was trickery in the method of selling it.

Similarly the public dislikes to have a store insist on any business method which is too obviously designed solely for the interest of the store rather than for the customer.

For example, I went one day to a candy and soda-water establishment, accompanied by a beautiful and estimable young woman, intending to buy a round of drinks. I found that none of the salespeople would accept my order as bona fide until I purchased a check representing the amount of my intended purchase. At that moment neither of us had fully determined just what we were going to drink. We were obliged to confer on this point, and then inquire for price quotations on the drinks we had selected; after which it was necessary to go to the cashier and pay thirty cents—I believe it was—for a check. Without this check, paid for in advance, we could not enter into the picture at all.

The whole thing suggested a distrust of its customers on the part of the store—as if there was a fear that, having quenched his thirst, a man would pull his hat on tight and make a quick dash for the door without paying for his drink or his ice cream.

A big store advertised a special mid-summer fur sale for two weeks in August at greatly reduced prices. There was a set of mink furs for one hundred and twenty-four dollars, which ordinarily sold for one hundred and sixty-five dollars. The day after the sale had closed, a woman went to that store and sought to buy the mink fur set at the special-sale price. They told her she could have

it only at the regular price of one hundred and sixty-five dollars. She explained that she had been out of town during the sale and did not feel that she ought to pay forty-one dollars additional only one day after.

The salesman admitted that it was tough luck, but was firm. She asked whether they wouldn't compromise and let her have the set for one hundred and fifty dollars. They would not. So she went away and the store lost the sale.

"But," explained the salesman, "she will do us a thousand dollars' worth of advertising by telling her friends of the incident. She knows now, and they will know, that our special sales are really great bargain offers, and on the level."

I once met a traveling salesman who is as particular about his complexion and general appearance as a society woman. This is not because he is vain but because he desires to make the largest possible income out of his work. He knows that unless his cheeks are pink and ruddy and his eyes full of the luster that comes with good health, he is not up to his highest efficiency as a salesman. There are psychological reasons why it is wise for a salesman to look healthy. In the first place, the best selling point for an article is to get it associated in the mind of the customer with success. Everything, even remotely connected with the article, that suggests success is a point which weighs in favor of the sale. If the salesman looks prosperous, the customer unconsciously

or subconsciously receives the impression that this prosperity grew out of the excellence of the article he is selling. The salesman should carry into a store an impression of success, prosperity, and harmony. He should look as if things are "breaking well" for him, as the saying is. Now the idea of complete harmony cannot be conveyed without health. A sallow complexion suggests that something is not just as it should be. An unhealthy man is more likely to get sympathy than admiration. Sometimes he even excites a feeling almost like contempt. And the feeling the customer has for the salesman often extends, subconsciously, to the stuff the salesman is trying to market.

So this salesman tries to be fairly aglitter with good health and vigor and success and content and general harmony. If a man asks him about his business, or family, or health, or what not, he tries to drive home the impression that everything is perfectly lovely.

This man takes a cold bath every morning. He is not one of those cold bath liars who like to tell about their icy morning plunge and how they revel in it. He frankly *hates* a cold bath. But he endures it because he thinks it helps him to look healthy and wealthy and wise. It is a means to an end.

A salesman should, of course, never be a bore. If necessary for him to do a lot of talking, he should try to break up his selling argument into easy

stages. In this connection, book agents have a little trick that may be worth knowing. A good book agent never begins at the title-page to go through a book and point out its interesting features. He is more likely to begin well toward the back of the book and jump from there to the middle, then to the beginning, back again to the middle—and so on. In that way, the customer never knows whether the selling argument is to be long or short. If a man were to show you a book and you thought he was going to start in at the front and take you right through, you would be horrified, and nip his talk right in the bud.

So it is in selling any other article. It is well to have a customer believe that in a moment the salesman will have said all he has to say. In that frame of mind, the customer may listen to him patiently for, maybe, an hour.

CHAPTER XIII

MEETING HUMAN NATURE HALF WAY

ONE of the phases of human nature that every big-store manager knows is the difference between men and women buyers seeking the same sort of article. For example, the average man, looking at a new suit, considers quality first, price second, and style third. With women exactly the reverse is true. Style is the paramount requisite. Then comes the question of price, and quality last. After eliminating the items of style and quality, however, price is more important to a woman than to a man. Women are more careful shoppers than men. They will go farther to get exactly what they want.

Each year sees an increased tendency in nearly all lines of business to cater to women buyers. Even in men's wear, advertising appeal is made about as much to a man's wife as to the man himself. Many men wisely let their wives buy their shirts and neckties, and the consequence is that fewer red neckties are being worn with purple shirts.

If a man goes into a store accompanied by his wife to buy himself a hat, suit, shirt, or even a pair

of garters, the clerk is likely to address himself chiefly to the wife. He knows that her judgment will largely govern the transaction. The reason she is along, in all probability, is that, just after some previous purchase of his, she has issued an ultimatum, declaring:

"The next time you buy a hat *I'm* going to pick it out!"

Moreover, the clerk knows that unless he is especially polite to the wife she will take a dislike to that store and talk her husband out of trading there again. On the other hand, if the husband should feel hurt because the clerk was inclined to ignore him, the wife, by the time they reach home, will have convinced him that his grievance was all imaginary and that the clerk was in reality a delightful man.

Not infrequently a store advertising men's underwear describes the goods in detail, something like this:

"The drawers are well made, cotton ribbed, with full gussets"—and so on.

Now, not one man in a hundred, or a thousand, knows what gussets are. I myself should not know a gusset even if it came down and perched right on my shoulder. Is it not a waste of words, then, to tell about gussets in the advertisement? No; because most men's underwear, in department stores, is not bought by the wearer, but by the wearer's wife. And she knows what a gusset is if he does not.

Thousands of articles are sold because they appeal to some one or more of the five senses rather than to one's reason. If a merchant or manufacturer can offer an article that tastes better, looks better, smells better, feels better, or sounds better, and *is* better than any similar article on the market, and has proper selling methods, he can make a fortune. Women, especially, are reached through their senses. They buy a fabric because it looks pretty or feels good when they take hold of it. A man is more like to consider such advantages as cheapness or durability: things, you see, which reach his reasoning powers. Automobile salesmen often talk to a woman about the shape of the car, the color of the paint, the upholstery, and the easy-riding qualities, rather than about the efficiency of the engine.

Men buyers are by no means immune, however, to this appeal through the five senses, though they are not reached in just the same way. The masculine tastes are more vigorous. A man may prefer a rich red color where a woman would wish pale pink or baby blue just as a man orders strong coffee and his wife, maybe, takes weak tea.

One famous store has given a great deal of thought to this item of color alone, to find what kind of ribbon on candy boxes, for instance, and what color in various other wrappings will attract the largest number of buyers. In selling candy it is necessary to keep it constantly in mind, too, that while women are the candy eaters, men are

apt to be the candy buyers—especially when it comes to the higher-priced goods. They buy for gift purposes. And a man will, of course, pay more for a box of candy to take to his sweetheart than she would pay if she were buying it for herself.

For many years a certain successful merchant, when buying goods for women's wear, has made it a rule to seek something that makes him, as he expresses it, either mad or glad. He says that it does not matter whether he likes or dislikes a design, so long as he has a strong feeling about it, one way or the other. Invariably, he declares, if a design or a fabric seems to him so bad that it irritates him, a certain proportion of his women customers will rave about it. Others will dislike it just as much as he does, and will buy the kind of style that he himself would prefer. The idea is that a striking article, one which makes a definite impression, will meet with both approval and disapproval, according to how one looks at it. The merchant never buys what may be termed a neutral article, one which fails to impress him as either very bad or very good. For he has found that unless it causes a positive reaction in his mind it will not sell readily. It will appeal neither to those who like what he does nor to those who like what he hates.

One day a suit manufacturer came to him with three dozen suits that he hadn't been able to dispose of. They were terrible looking suits—of weird color, and of a design which suggested that the

tailor might have cut them out with a knife and fork.

"I haven't the nerve to charge you for these," said the manufacturer, "but I wish you would take them and try to sell them. If you do, just pay me whatever you think right."

The merchant did so. He placed one of the bizarre suits in the window, with the price, fixed at random, $14.95. Sure enough, the suit was so bad that many women decided it must be good. Every one of the three dozen was sold within twenty-four hours. Such is human nature. There are so many kinds of people in the world that almost every shading of taste has its direct opposite. The kind of woman one man might pick for a wife would not appeal to some other fellow as worth even a fraction of her upkeep. So it goes.

The old-fashioned way of selling things was for a storekeeper to lay in a supply of whatever he thought his customers would want, or ought to have. Sometimes he bought too much, and frequently he did not buy enough. Everything was left to chance, or to haphazard guesswork. Today a good retailer proceeds more scientifically. By using the law of averages he aims to know in advance exactly what his customers are most likely to want, and provides just that. He knows more about an average customer's needs and preferences than the average customer does himself.

Consider, for example, the item of perfumery.

Now, there are all kinds and grades of perfumery, from the very mild to the extremely smelly kind and it is used by all types of women. One way to sell perfumery would be to pick at random a variety of grades, and trust to luck to hit on an assortment that would sell evenly. Obviously it would be a big disadvantage to have a large surplus of one kind but not enough of another. A large chain drug-store corporation determined to find out exactly what kind of perfumery women like. By offering free samples and talking to the women who accepted them, they ascertained the preferences of several thousand women. Among other things, they learned that one woman out of every ten does not like any perfume at all. One fourth of all women customers at the perfume counter desire a strong, aromatic variety; but two thirds of the women want an odor that is extremely mild and delicate. These specifications, of course, are not sharply drawn; of those who desire a pungent odor, not all like just the same strength. But in a general way the proportions mentioned about represented the demand. Moreover, these proportions were practically the same whether the women were on Broadway or in Iowa.

Similarly, this drug-store concern found out what kind of candy people like best—how much more popular is chocolate with nuts in it than caramels, and all such facts as that. They know that chocolate sirup is the flavor most sought at the soda fountain; but they go further and try to

learn exactly what particular *kind* of chocolate flavor will give the most general satisfaction. Also, they seek to know not only that people like a certain thing, but why they like it. Referring again to perfumery, for purposes of illustration, they saw that the odor of the rose is much more popular than that of lilies or lilac. And the reason is that one tends to be buoyant while the other is heavy and depressing. A blended perfume is more popular than any one particular odor—because a person tires of too definite an odor, just as one tires of too decided a pattern in clothes. A plain blue serge will sell better in the long run than a black and white plaid. The subtle, intangible thing in perfume is best because it carries with it something of elusiveness and mystery. The average woman does not like to be identified by her fragrance the moment she enters a drawing-room. And no husband wishes to have his wife use perfume of too decided an aroma, no matter how well he might like it at first. In time it might get on his nerves.

One must never lose sight of the fact, in retail business, that people are creatures of habit. If they have been accustomed to buy an article in a certain shape or certain color of box, they do not know what to make of it if the color or shape is changed. For instance, cotton batting and medicated cotton have for a great many years come wrapped up in blue tissue paper. The idea is the same as that which prompts us to put bluing into the water when we wash clothes, because the blue

makes the white seem whiter. During the war it was difficult to get the dyes for this blue tissue paper. But to use pink paper or plain white paper would have meant a big reduction in the sales of the manufacturer who attempted anything so revolutionary. People are so in the habit of buying cotton in blue paper that they would be slow to believe it was the same cotton if done up in any other color.

Many stores make it a point to have what might be called suggestive grouping of articles. When a man comes up to buy a safety razor, he finds various other toilet accessories—shaving soap, talcum powder, and the like—in the same case, or near by, where his eye may easily take note of them. Any good clerk can tell which customers will welcome suggestions and which will not. When a woman walks up to the counter and states in an authoritative tone that she wishes to buy a hairbrush, and has the air of knowing exactly what she wants, a suggestion may irritate her. But, on the other hand, there is the customer who, obviously is not certain about her needs, and to her a suggestion is a favor.

There is a funny thing, though, about making a suggestion. Unless it is timed just right, it does not lead to any more sales. It should be made within a few seconds after the customer has made his first purchase. If the clerk takes the customer's money, gets his change, hands it to him, and then suggests something else, it is likely to be too late.

The customer doesn't want to go through the whole operation of buying and getting change again. Unconsciously he regards buying anything as a closed incident for the time being. Neither is it wise to talk about selling him something else before he has finished selecting the article he came in for. Let us suppose that a woman asks for a toothbrush. If the clerk instantly says, "And will you need any tooth powder?" before showing her the toothbrushes, she is justified in being annoyed.

Here is an odd little phase of buying-and-selling psychology:

Two men in a certain town run little stores in competition with each other, less than fifty feet apart. One seems to do a little better than the other. I asked him for the explanation.

"Well, for one thing," he said, "I keep my doors open later in the fall than he does, and swing them open earlier in the spring. All summer I keep my goods in show cases, so that I don't require door screens. The customer who has the slightest notion of coming in here finds that he can do so with the least possible resistance. Everything else being equal, a man would rather walk into a place where he doesn't even have to shove a door."

The average person is not a close observer. It is necessary to go more than half way to meet the average customer's ordinary range of vision, because he will not go the other half. One concern made hundreds of experiments with signs at soda fountains and found that, to get the best results,

they must have a sign directly on the level of the average customer's eye when he is seated. As near as they could ascertain, an announcement of a new drink displayed at eye level is just five times as effective as one two or three feet higher than the eyes. An observant man may look up and see the sign that is higher up, but, as I say, there are comparatively few observant men.

And in signs, just as in any other form of advertising, it is important to have enough variety in the type sizes to give the eye convenient stopping places. For instance:

IT IS EASIER TO READ A LINE LIKE THIS—in a window card,

than—

TO READ ONE LIKE THIS

The letters in the second line, while capitals, do not afford the restful variety of the first line. Where the first letter in each important word is higher than the others, they are like hooks upon which to hang one's attention.

CHAPTER XIV

TO BUY OR NOT TO BUY

It used to be that a man who was a seller of goods was also a buyer—of food and drink and entertainment. To-day the professional buyer is just as likely—maybe a little more so—to buy for the seller, as for the seller to buy for the buyer. The old-fashioned salesman proceeded on the assumption that anybody who bought from him was bestowing a personal favor and should be made a fuss over accordingly. Yet, when you stop to think about it, if an article is worth having, and the price is right, why is not the buyer of it just as much under obligation to the seller as the seller to the buyer? The man who buys the article prefers it to the money he pays for it, else he wouldn't take it.

I knew a young man once who was a bit of a soldier of fortune. He had a habit of running out of money at inopportune and unexpected places. On one of these occasions he had to choose between eating at cheap restaurants at his own expense and eating at high-priced hotels at the expense of somebody else. He picked the latter course, inasmuch as he felt at home—so he told me—only in an

atmosphere of more or less grandeur. The cheap places jarred on his tender sensibilities.

His first step toward having his meals bought by others was to go to the Public Library and read up on the technical points of certain kinds of high-priced machinery manufactured in that city. Equipped with this information, he called up the head salesman of a big machinery concern and asked the salesman to call at his hotel. He gave out the impression that he was representative of a big firm in another city, which was in the market for such machinery.

He contrived to have different salesmen take him to dinner—and even to breakfast—for three or four days, until he got ready to leave town.

The point to all this is that this gracious grafter might have more difficulty in working a game like that at the present writing. He might have to go and get in line and endure a long, irksome wait before he would have a chance to talk with the head salesman. A man selling an article of real merit is often so busy just now in pacifying customers who are complaining about slow delivery that he hasn't any time left for entertaining mere prospects.

A good example of this is in the automobile industry. Only a dozen or so years ago a great many automobile salesmen were somewhat the same type as wine agents. They were affable entertainers, and it was not unusual for them to abandon hope of selling a man a high-priced car unless they could do so when his mind was not altogether

clear. To-day, if you buy any of several autos, you probably try to work a personal pull with the agent in order to get more prompt delivery than some other customer. The chances are that you do not even ask for a very elaborate demonstration, but buy on hearsay—that is, on the general reputation of the car. A great many autos—even of the higher-priced makes—are sold over the telephone, just like butter and eggs or any other staple commodity. No one expects his grocer to come round and buy him a drink before landing an order.

A young man I know determined to buy himself a small auto. He thought the thing over a long while before making up his mind, and the proposed purchase was discussed in his family until it naturally took on a lot of importance. It marked an epoch, in a way, such as when he got married and the time he bought his home. The passage from the pedestrian class to the automobile class was no trifling event. So, when he went to the marts to buy, he felt that he had coming to him a great deal of deference.

"I'm thinking," said he to the agent of the car he had selected, "of buying a car."

"All right," agreed the salesman, pleasantly. "If you place your order to-day I might be able to get you delivery inside of a month."

He was courteous enough, but he talked in an offhand tone as if he had been saying:

"Will you take it with you or shall we send it round on the afternoon delivery?"

"I should have had a lot more attention paid to me," remarked the customer in telling of the incident, "if I had been buying a lawn mower, or even a good monkey-wrench."

However, the change of attitude is not so much on the part of the seller as on the part of the buyer. There is just as much selling competition as there ever was—probably more; and that is why the buyer has come to look at things from a new angle. A great many lines of goods are bought by professional buyers, and the professional buyer is the fellow who first saw the light. He found that being entertained or palavered over was costing him money—too much money. He decided that he was being played, as the saying is, for a sucker.

The seller entertains the buyer in order to place him in rare good humor and get him to buy at the highest possible price. The buyer awakened to the fact that in the long run he himself was paying for all meals and theater tickets provided by the genial and urbane persons who had things to sell. Inasmuch as he was paying the bill, then, why not appear as the host and get credit for the outlay, and make capital of it for his own purposes?

There was a chairman of the Committee on Foreign Affairs, in the House of Representatives, at Washington, not so many years ago, who used to give dinners to various dignitaries, sending out invitations in his own name and getting all credit for the entertainment, but assessing the cost among the various members of the committee.

This was, in a way, what used to happen and doubtless still happens between a great many salesmen and buyers. The buyer is entertained until he buys enough goods to pay not only for the goods but also for the entertainment.

But the wise salesman prefers to have his customer in such a frame of mind that *he* will offer to buy the lunch or the dinner. For he knows that a customer likes the sensation of being entirely free from obligation to the salesman with whom he is dealing. Moreover, the man who has just bought a dinner feels more kindly toward his guest than if the other fellow had paid the check. It is human nature to be so pleased with one's self after doing a kind or agreeable act that one feels well disposed toward the person receiving the favor. I used to know a young man who was rescued from drowning by a pretty girl with whom he had been on extremely friendly terms. Not more than a month after that he, in turn, rescued another girl from drowning. He married one of these girls. But not the one who had rescued him. The other one had made him a hero, and he loved her for it.

John J. Hicks is head buyer for a great retail establishment in a Middle Western city and goes to New York several times a year to buy goods. He got a large amount of pleasure out of these trips East. What with theaters and dinners and automobile rides and one thing and another they formed bright little spots in his busy life. His host

at a great many of these nice little parties was Max Izzent, or some such sounding name as that. Somehow or other the store Hicks bought for was never able to make much profit out of the goods it got from Max Izzent. Yet a rival store up the street sold a lot of the same line of goods; and from the way it pushed them, it looked as if it was making a good deal of money out of them.

John J. Hicks tried to buy the goods cheaper, but without success. He became convinced that the buyer from the rival store up the street must be getting them cheaper, else he would not have bought in such large quantities. Hicks also noticed that the rival buyer hardly ever accepted hospitality from Max Izzent. He therefore took a size-up of the situation—and bought some theater tickets. He bought them from a speculator at a fancy price, and they were for a show that was selling out, mostly, two weeks in advance. Then he went to the telephone and called up Max Izzent.

"Max," says he, "a friend of mine from Omaha was called home on account of the serious illness of his old Aunt Ella, and he gave me some tickets he had managed to pick up a week or so ago for *The Cerise Nightie*, up at the Juckandpudge Theater. I've been wanting to see that show, Max, but I don't want to see it unless I can have some good fellow like you along. Will you join me?"

Now Max had been taking Hicks to theaters, but that was purely a matter of business. Here,

on the other hand, so it seemed to Max, was Hicks taking him just because he enjoyed his company. That was really quite flattering. He thought more of Hicks than he ever had before. Hicks was a good old scout, so he declared to himself, to prefer his society to that of anybody else in New York.

Up to that time Hicks had never felt like quibbling over the mere matter of price with Max Izzent, after Max had been so hospitable toward him. Now, however, all this was changed. He was doing something for Max, which made him have a rather patronizing feeling toward Max. He could talk to him in fatherly fashion and tell him frankly that his prices were too blamed high! The consequence is that since then he has been buying things from Max for at least thirty-five per cent. less than he ever did before.

Hicks learned the advantage of making a personal hit with the men from whom he wished to buy and winning their warm regard, instead of merely permitting them to ingratiate themselves upon him. One man with whom he had been dealing had recently built himself a big home over in a bleak section of New Jersey. Hicks found that the man was itching to entertain somebody in this fine new home, but it was so far out that his New York friends were slow to come. So Hicks drew him into conversation about nice places to live, and the man naturally fell to talking about his new house in Jersey.

"Sounds mighty good," remarked Hicks. "Why don't you ever invite me over there? You know how I hate the confusion and bustle of New York."

"Come over to-night!" exclaimed the salesman with enthusiasm, slapping Hicks on the back.

And Hicks went. It paid him to go, not only because he could do business with the man on a much more advantageous basis thereafter but because of the real pleasure it gave his host. In this instance the obligation all went toward Hicks, even though the other man was doing the entertaining. He felt grateful to Hicks for giving him an opportunity to show off his new house, just as a child is pleased when anybody seems to show a genuine interest in his newest toy. Hicks was a man more familiar with the social graces than the salesman himself, and the visit flattered him.

A shift in buying and selling practices seems to be slowly taking place. Understand, I do not mean that there has been a complete change—a revolution or anything like that. But there is a difference. There is one class of buyers, however, who still expect to be carried about and fussed over with considerable éclat; and these are the buyers from the smaller towns, who are usually also the owners of the establishments for which they buy. They are a little behind the professional buyers from the big cities in finding out the advantage of entertaining the other fellow instead of letting the other fellow entertain them.

There is another vast advantage the professional

buyer has over the small-town merchant who does his own buying: The latter is so much more concerned with various other details of his business that he gives little thought to whether or not he shall buy a certain lot of stuff until a smart salesman drops in on him.

Then what chance has he? He must match his wits against the salesman, who is a specialist at talking people into buying things, whether needed or not. The salesman has been practicing on his line of argument for weeks. There is scarcely a loophole of possible escape that he hasn't thought about scores of times in advance. The merchant, on the other hand, has to combat these selling arguments with such a line of defense as he can rig up on the spur of the moment. And this is not so easy as one might think. The chances are that the merchant falls a victim to the salesman's cleverly worked-out conversation—and overbuys.

I asked an old, experienced salesman once why so many retail enterprises sooner or later fail. Without a second of hesitation he declared:

"It's because they do not buy with sufficient care."

He went on to say that the smaller the town and the smaller the business, the more likely the storekeeper is to overbuy. Go into almost any small country store and you will find a large percentage of goods which are practically worthless—stuff that the proprietor couldn't sell in a hundred years, except at a loss. If you were to investigate,

the chances are that you would find this percentage of useless stock growing smaller and smaller as you looked into bigger establishments, until in the case of a great department store there is practically no dead stuff on the shelves at all.

The trouble is that most of the business education has been along the line of selling. There are schools of salesmanship and talks on salesmanship and magazine articles about salesmanship, but right offhand I cannot think of ever having read a treatise on how to resist expert salesmanship.

A high-grade salesman was endeavoring one day to obtain an order from the head of one of the leading department stores in Pittsburgh. The two were warm personal friends, yet the salesman could not get his order. He finally gave up somewhat in disgust, and the two got to talking of other matters.

"What," asked the salesman, "do you regard as the chief secret of your success?"

"Undoubtedly," replied Mr. Boggs, "it is being able to resist a man like you. Here we are, old friends; you're a gifted salesman, and your goods are always the very best of their kind. It is, indeed, a strong temptation to buy from you. But I don't need anything from you at the present time. So I must say 'No.' Except for my ability to say 'No,' I should have been on the rocks long ago."

A once-successful publisher brought a great magazine to financial ruin a few years ago for that

© *American Magazine*

Many a business enterprise has been wrecked because of the inability of the proprietor to resist clever salesmanship

very reason. Every time he saw a clever manuscript he could not resist buying it. Before long he had thousands of dollars tied up in manuscripts stacked away in his safe. He could not have used them all in fifty years.

CHAPTER XV

FINDING THE KEYNOTE

ALMOST any average man likes to be flattered about his masculinity, just as the average woman likes her beauty to be noticed. All men, a barber will tell you, love to hear that they have an exceptionally tough beard and are hard to shave. You can make a bosom friend of a scrawny, undersized man by telling him that you bet he is mighty and strong and wiry, and that he will live to put flowers on the graves of his more robust-looking associates.

Every man has some keynote that completes a chord. Often it is the exact opposite of what one might naturally expect. A comedian, for instance, will feel twice as flattered if you tell him you know he was born to play tragedy than if you tell him you laughed yourself sore at some of his comic antics. A statesman's greatest vanity may be his belief that he can play the violin or that he is a good judge of fancy chickens.

Frequently a handsome woman in business is more proud of her commercial ability than of her face or figure.

One unusually successful salesman I know keeps

a little card index telling the most direct route to the hearts of all his customers. Public speaking, dogs, trout fishing, children, gardening—those are among the notations on his cards.

If you were to go into the office of Louis W. Hill, head of the Great Northern Railroad, and try to see him on a matter of the utmost importance, you might get your card returned with regrets. But send in a message that you have come to talk about Col. Bill Hanley, of Bend, Oregon, and you are almost sure to get an immediate audience. Col. Bill Hanley happens to be not only Hill's friend but his hobby.

I recall a brief interview I once had with John D. Rockefeller. There were several possible methods of approach. One was to flatter him about his little household economies. It was common knowledge that if you told Rockefeller you had heard that less food was wasted in his household than in the humblest home, he would be immensely pleased. Petty economies comprised what Rockefeller regarded as one of his noblest virtues. Another thing he liked to hear was what a power for good he was in his church or Sunday-school. A few days previous, I had been to his church in Cleveland and heard him make a short talk to the Sunday-school children. It was just an ordinary, platitudinous talk. But I told him how much I enjoyed it and what a lot of good it must have done. He became rather cordial immediately.

If I had started in to tell Rockefeller that I

considered him the greatest business man, or the greatest financier, the world had ever known, probably he would have been bored. He would have known that I was not competent to judge his business ability, and that my opinion on that subject was well-nigh worthless. But he appreciated that almost anybody was capable of judging whether or not he was a good talker.

A friend of mine had an almost identical experience with Andrew Carnegie. The steel man had delivered an address at the College of the City of New York. At the close of the exercises, Carnegie, all rigged up in a cap and gown, was marching along in a solemn procession of faculty members and graduates. My friend, a New York newspaper reporter, sidled up to him and began to talk about how much he had enjoyed Carnegie's speech —how helpful and inspirational it had been. In a moment he had steered Carnegie out of the procession to a little seat, where he got answers to a lot of questions that the steel master would not ordinarily have listened to.

Once I wished to talk to the late Chief Justice Fuller at the close of a speech he had made before a Western college. I realized it was no use to say anything to him about his oratory, because public speaking was to him an old story. But I did say to him:

"Mr. Justice, I didn't suppose a man on the Supreme Court could be so human."

At once he gave me a smile right which came

from his heart. The old chap liked to be regarded as a human being.

A lot of men like to hear just the opposite. Many a man likes to be looked upon as a mere intellectual machine. In doing business with a man once, I insisted on having everything in writing.

"Because," I told him, "you're so cold-blooded and shrewd that I want to know just exactly where we stand."

At that he fairly beamed all over. It was his ambition to be thought cold and shrewd in business matters.

Then there are men whom you can win by telling them how immoral you imagine they are. Or that you think they are working too hard. Still other men can be reached only by listening to them. Just let them talk on and on, and look interested, and they will have a high opinion of your judgment.

Years ago, when I was a young reporter doing police news, there was a big fat policeman named Jim Williams who was one of the best news sources in town. It seemed as if more strange things occurred on his beat than anywhere else. All of us who were obliged to write of fires, accidents, burglaries, killings, and the like, tried to cultivate Jim Williams, to ingratiate ourselves in his favor. None of us could get so many profitable tips from Williams, however, as a reporter on one of the morning papers named George McFarland.

Nearly every day McFarland would have at least one exclusive piece of news, and usually it would appear to be traceable to Jim Williams. It was bad enough to be beaten on these news stories, but it was particularly irritating to have to trail behind McFarland, for he was in many respects the poorest reporter in town. All the rest of us on the police beat felt rather important over the possession of college degrees, and thought we could express ourselves in good high-brow English. Poor McFarland had scarcely any education at all. Moreover he drank some, was unkempt in appearance, and looked more like a tramp than a representative of a great daily organ of progress and enlightenment. I doubt if he could have constructed a grammatical sentence. He collected his facts and telephoned them to his office to be written. And, as I have said, he obtained facts that the rest of us overlooked—largely because of his ability to maintain the respect and esteem of Jim Williams, the policeman.

"It's this way," somebody suggested one night, as a disgruntled quartet of us sat in the reporters' room at the central police station, "Williams is a stolid sort of big cop, not of very high mentality. He lives on about the same intellectual plane as McFarland does. Naturally they have a good deal in common."

That set me to thinking. I made up my mind to get in with Policeman Williams on some basis of amity and equality which would lead to a free

© *American Magazine*

Jim Williams' keynote was food—things to eat!

exchange of ideas and knowledge. I sat down and tried to think what I would enjoy talking about if I were a policeman forty-two years old and weighing two hundred and forty-seven pounds. Obviously, he would probably care little about Chaucer, dramatic sequence, the binomial theorem, or the nebular hypothesis. I would have to get down to some of the more elemental things of life. Well, I went out and tried him on a number of topics, which included: baseball, politics, horses, prize-fighting, and physical culture. The only good response I got—the only positive reaction, as they say in scientific circles—was from the latter topic —physical culture, or how to keep one's self in the pink of physical condition. Williams was a trifle vain about his physique. He gloried in his strength. Yet I found that I was still a trifle shy of hitting the nail right on the head. I felt certain I was getting warm, as the saying is, but there was something else that Williams would rather talk about than his physical prowess. Quite by accident I stumbled upon it. From physical culture we went by easy stages to the matter of diet—diet and food and cooking. There at last was Jim Williams' keynote. Food! Things to eat!

When you pause to consider it, this fad was not surprising: here was a big, able-bodied man who was obliged to tramp about the streets all day with scant opportunity for mental stimulus, but all the time working up a fiendish appetite. Naturally, he was able to consume large quantities of food,

and he tried various kinds. He learned to like food that was well prepared. He came to regard himself as something of an epicure. Food was his hobby. After I found this out, Williams and I used to stand on street corners discussing food and culinary processes for an hour at a time. His favorite proposition for friendly debate was whether stewed chicken is better than fried chicken. I always spoke in behalf of fried chicken, and he was firm in his advocacy of having his chicken stewed. Before leaving him, however, I always conceded that perhaps he was right. No matter how often we held this discussion, the policeman was always eager to take it up again. He was like a child who never tires of the same little bedtime stories over and over and over again.

The consequence of all these heart-to-heart conversations with Jim Williams was that he came to have a warm, personal regard for me, and he saw to it that I got always a little more than my share of news events off his beat.

Without knowing it at the time, I was learning salesmanship. I could have sold Jim Williams anything from a gold brick to a threshing machine.

I remember having once a difficult newspaper assignment which took me to a cattle ranch out West. There were two cowboys there with whom I was obliged to make myself solid, for I desired information which they alone could give me. This seemed like a woefully difficult task, for I was a tenderfoot and they were more likely to laugh at

me, I feared, than to confide in me. But I quietly looked about for the proper sort of topical fulcrum. Among other things, I chanced to note that there was a division of opinion among the cowboys on this ranch as to whether it was better to have double girths or a single girth on a saddle. Moreover, I heard arguments about the wearing qualities of two different brands of overalls. I made it a point to find out what brand of overalls my two men wore, and how they felt about single or double girths. It happened that both men were in sympathy with the double girth cult, and I accordingly found opportunity to remark casually to one of them that I was surprised to see so many men, otherwise intelligent, who rode on saddles having only a single girth. I said that it seemed to me two girths would not only be a great deal safer for the rider, but vastly better for the horse.

"You've said something, old pardner," agreed the cowboy. "A man couldn't give me a saddle with only one girth on it."

And from that time on we rapidly became friends. Then he and the other man and I took up the overalls question. My point of view was in such accord with theirs that their respect for me grew still greater.

That reminds me of a little episode at the time of the San Francisco earthquake, to "cover" which a reporter named Ross was sent out by his newspaper. Ross learned that United States marines had been landed in the city to maintain martial

law and stop looting. Certain members of one company of marines had witnessed a lot of human interest scenes which he wished to know about. But he knew he would get little detailed information if he merely went to members of the company and asked them point-blank for what he wanted. He must get to talking to them about something which would appeal to them right from the start. This was not easy, because the things the marines knew about and were most interested in pertained largely to matters aboard ship, concerning which Ross knew nothing. Finally, he figured the thing out: A marine, living mostly on shipboard, does not ordinarily do a great deal of walking. These men were not only obliged to do a big amount of walking, but they must do it over streets littered with all kinds of rubbish and obstacles. It stood to reason that their feet must get extremely tired and sore.

So Ross talked to the marines about sore feet!

And he made a hit with them. They welcomed him among them as one who spoke their own language.

In a little town lived a man who made a comfortable fortune by conducting a clothing store. Considering the amount of his investment he made a bigger profit than any small town merchant I ever heard of. Yet he was a man of just average ability. The secret of his success was simply his gift for playing on people's vanity. He never permitted a young man to buy a suit of clothes without

patting him on the back and whispering in his ear something like this:

"I tell you, old fellow, it doesn't do me any harm to have people know where you buy your clothes. You've got a nice athletic build and always look well; you're a good advertisement for me. I'll appreciate it if you'll drop a remark now and then about where you bought your suit."

He made it his business to know the hobbies and little vanities of nearly everybody in town. If a man had a dog he was proud if the storekeeper would talk to him somewhat in this vein:

"A friend of mine down East wants a dog like yours. I was telling him you had the best dog of its kind in this part of the country, but you wouldn't sell it!"

If the customer's main pride in life was his wife, his weight, his front yard, or his golf game, he could not easily get out of the store until the proprietor had patted him on the back and complimented him on the thing he most liked to hear about.

I never bought a shirt or a necktie from the man when he didn't remark:

"You certainly have the knack of picking the pretty patterns. I must lay out one like that and take it home for myself."

He told everybody that.

A real-estate friend of mine flatters his clients by a little scheme that he says has proved to be worth the extra time it requires. A customer drops in and wants to buy, let us say, a piece of investment

property. The man's financial status is such that he could not swing a piece of property worth more than ten thousand dollars. So this real-estate dealer tells him he has the very thing—and shows him a place worth thirty-five or forty thousand dollars.

The man is then in the position of the negro who was asked for a loan of ten dollars and said: "I ain't got ten dollars, but I thanks you for the compliment all the same." He has a high opinion of the real-estate man's judgment in sizing him up for a person who would think nothing of dashing out forty thousand dollars. And though he does not buy any of this expensive property he ends up, perhaps, by at least buying something.

This real-estate man hit on another way to play on people's vanity. He found that nearly everybody takes pride in the ability to drive a good bargain. This is especially true of a great many women. So, in repapering houses he has for rent, this man always lets one or two rooms go until a tenant is about to move in. The tenant is almost certain to want something done, if for no other reason than for the sport of driving, as he thinks, a close bargain. The real-estate man then agrees to redecorate the two rooms he has reserved for that very purpose, and both parties are pleased.

I have frequently had occasion to observe that to win the favor of a certain type of men it is necessary, in so far as possible, to make even one's language correspond to his. For instance, I heard of a bright young man, just out of an Eastern

college, who failed to land a big order with a country storekeeper, just when the deal was about closed, because his talk got on the storekeeper's nerves. It seemed that the young man had been taught to say "bean" for "been," after the English fashion. The storekeeper declared that he was "too blamed grammatical."

Once I sought information from an odd old character who lived by himself out in the country. I was tipped off by neighbors that he was hard to approach and had an aversion to "city folks"; that I should wear old clothes, and adopt a rather rough, uncouth line of talk, being careful to say "have saw" and "has went." I did as directed and stopped at the man's house one afternoon on a pretext of getting a drink of water. We were getting along first rate when he chanced to say something that I did not hear distinctly. Thoughtlessly I said, "Beg pardon?"—meaning for him to repeat what he had said.

The moment I said "Beg pardon," he abruptly severed all diplomatic relations. He simply walked back into his house and slammed the door. I seemed to him too formal and polite. If I had inquired, "Whut's that you said, hey?"—all would have been well. Such characters as that are unusual and, of course, rather negligible. The point is that in meeting people it is often necessary to adjust one's conversation and phraseology to theirs, or else they will feel ill at ease, and will not readily respond to one's wishes.

I was sent one time to obtain an interview from the governor of a great state. It was on a matter that he had refused to talk about, and I went on the mission knowing that several others had failed.

A few hours before starting I inquired about the place up in the country, where the governor was spending the summer, and found that it was in a locality of great historic interest. That recalled to my mind that the governor's hobby was American history. So I hastened over to the public library and crammed as much information into my head as I could before train-time about the early history of the section where the governor lived.

At the governor's home, I did not wait for him to ask me what was the real object of my visit, but began to talk about the wonderful scenery, and about the fact that it was my first trip into a locality I had known about chiefly by reading of it in my school history as a youngster. Thus we soon got launched into a discussion of American history—a discussion in which I would have been lost except for having fortified myself hurriedly at the public library just before leaving the city. We sat on the governor's veranda and talked for an hour without the governor ever pausing to wonder what had really brought me there—he was that much interested in the discussion. Gradually I steered the conversation around to the political matter that I was anxious to know about. But the moment he started to talk of that I purposely interrupted him to ask about something

else along historic lines. Then later I apologized for the interruption and let him talk politics, just as if I were listening to that solely out of politeness. We became quite friendly. Finally it occurred to him to ask:

"Just what mischief are you here for, anyhow?"

I told him, and he said he would not talk politics. But I reminded him that he had already done that very thing. He insisted that he had not done so for publication. I persuaded him to let me use what he had said, with the exception of one or two details.

Now, except for our long talk about history, which had given us a chance to get acquainted, he would never have talked politics at all, and even if he had he would not have granted me permission to quote him. It would have been the same way if I had gone to him as a salesman. If on my arrival I had let him know what I wanted, he would have refused point-blank, and it is doubtful if any amount of persuasion would have changed him.

Sizing up a man is often a matter of simple elimination. Sometimes I amuse myself by trying to tell all about strangers I see in public places. One winter night, I sat next to a substantial-looking old chap and his wife in a theater. He was a quiet, humble-appearing fellow, and yet I knew that he had money, because both he and his wife had clothes of excellent quality—even though they were not especially stylish—and his wife wore

a good deal of expensive jewelry. Yet the man looked rather ill at ease. From this I judged that he had not always been accustomed to the luxuries of life; theater-going, I felt sure, was rather new to him. I wondered how he had got his money. Probably not by inheritance, for if it had been in the family for a long time he would have been more used to it. Not by any short-cut, get-rich-quick scheme, for he had too honest a face, and he looked like a lifelong toiler. Not as a member of any profession, because he was not well enough educated. Not in retail trade of any kind, or he would have been so accustomed to meeting all sorts of people that he would have looked more at ease.

I made up my mind that he must be a manufacturer. He was not running an automobile concern, or making any kind of product with a lot of different parts, because that would mean various departments to his business, and would require probably more executive ability, more capacity for organization, than his face indicated he possessed. Therefore, he must be the manufacturer of some simple, staple product. His business must be one that had grown gradually from a humble beginning something that would not require an elaborate equipment to start with.

Between the acts we got to talking, and I found that he was the owner of a prosperous little brickyard in a Western city.

Obviously, if I had been intending to sell that man something, it would have been a big advan-

tage to know what his face told me about his career and characteristics. Likewise, if his face had indicated him to be a serious-minded man, I would not approach him in the same way as if he were a man who must be joked with.

The story is told of a traveling man who lost a big sale by springing on the wrong customer a little joke that was then going the rounds. He took a match from his pocket and told the customer it was a new kind that would light if one threw it up in the air. As he tossed it up, he said:

"See, it lights on the ground."

The customer turned on his heel in disgust, declaring:

"I wouldn't buy anything from you. You're too con-demned smart!"

A man of a different type of mind might have taken a liking to the salesman for showing him a joke that he could try on his friends.

Too much importance cannot be attached to the auspices under which you meet a man. You can walk right in on some men, introduce yourself, and immediately stand on your own merits. But other men have a habit of judging a new acquaintance by the company he keeps—or doesn't keep. The quickest way to make progress with such a man is to get one's self identified with persons whom he regards favorably, or, better still, to be introduced to him by somebody who has his full confidence. On one or two occasions I have been sent into a

city after certain information, and have remained there a week without ever going to see the man I really wished to see. I devoted myself to scraping up an acquaintance with the men or women who could give me just the right point of contact with him.

Often one can tell a man's business or his instincts by studying his face, watching his actions, or listening to his talk. One morning I had a caller before breakfast at the hotel where I was staying. I asked that he be sent up to my room. As he entered I apologized briefly for having to receive him in an old lounging robe, explaining that when he called up I was right in the midst of taking an informal little bath.

"Ah, that's all right," he replied, breezily; "bathing is a good thing both for the individual and for the State."

The impression came to me at once that the man must be an insurance agent. Only a salesman or a lawyer—men who make their living partly by conversation—would have been likely to utter such a comment so glibly. The man probably was not a lawyer, because, in the first place, there was no reason why I should have received a call from a lawyer; in the second place, he had the attitude and expression that salesmen seem to acquire after several years of service. The most likely type of salesman to call on a man of my condition of life was an insurance agent. I judged him to be one —and I was right.

Moreover, though he was energetic and enterprising, this man was not a really successful salesman, because he lacked tact—else he would not have called on me without an appointment at such an inopportune time. Because he got me out of the bathtub, if I had wanted any life insurance I should have left no stone unturned to make certain that this man did not sell it to me.

And this reminds me that a salesman should try to find out in advance a prospective customer's moods and daily habits. If he is a man who has important work he likes to perform before noon, he should make it a point not to disturb him until afternoon. But if he is a man who tires easily, is in the habit of eating a hearty lunch, and becoming sleepy, crusty, or irritable in the afternoon, naturally the salesman should aim to see him in the morning.

CHAPTER XVI

APPLYING IMAGINATION

HUMAN nature is full of curious quirks, and imagination is stirred by trifles. A number of years ago, when William Gillette was appearing in the play *Sherlock Holmes*, he wore a lounging robe in one scene; and whenever the play came to a city there was an increase in the sale of lounging robes in that city. It was not because there was any greater need of such a garment than before, but, of all the men who went to see the play, many were impressed with how clever and attractive they themselves would appear if they were to loll thoughtfully about the sitting-room, in easy, graceful attitudes, incarcerated in a handsome lounging robe.

On the other hand, a wholesale grocer tells me that some time ago, when the famous "Hand him a lemon" joke was new and going the rounds, there was a noticeable falling off in lemon sales. People actually disliked to go into a grocery and ask for a dozen lemons, for fear the clerk would make some laughing reference to the joke. They got tired of hearing the lemon expression, or else got lemons unconsciously associated in their minds with something comparatively undesirable.

A merchant one day placed on display a show window full of electric toasters and electric irons. With these were neatly lettered cards explaining what the articles would do. Nobody paid any particular attention to the display. Then the merchant chanced to hit on the plan of having some nice, fresh, crisp-looking pieces of toast on the toaster, and some more pieces all buttered, ready for the ultimate consumer, on a pretty plate near by. The electric iron rested on a cute little outfit of French lingerie, such as is worn by beautiful heiresses. This method of display immediately attracted customers into the store. Just as many people knew that the toaster was a device one could make toast on, when there was only a printed card alongside of it, instead of the toast. But the one method stirred the imagination and the other did not.

It has not been so many years since concerns manufacturing high-grade brick used to throw aside and sell at a great reduction all bricks that were overburned and, therefore, not of uniform color. One day a brick man became possessed of a bit of imagination. He arranged a lot of the spoiled bricks into a little wall, with the colors harmoniously blended, and called it a tapestry effect. Then he exhibited this wall to customers and began to charge about four dollars a thousand more for the spoiled brick than for the other. People gladly paid the extra charge because of the beautiful color effects that were possible with the overburned bricks.

It is a part of human nature to pay special heed to that which bears the stamp of success. You start out in New York to attend a theater. There are plenty of good shows, but you find that only one theater is sold out. So you immediately lose interest in all the others and set your heart on going to the one where seats can be obtained only by paying a premium to a haughty speculator. It may not be a very good show, after all, but you think it is, else why would so many persons have clamored to get in? On the other hand, you drop in at an excellent performance where the theater is only half filled, and it is difficult to get much pleasure out of the entertainment, because you keep looking at the empty seats and thinking that the show must be extremely poor or those seats would have been occupied.

A certain restaurant proprietor had enough imagination to take note of this human trait and utilize it in his business. He knew that his restaurant could not draw as large a trade on some days of the week as on others, and that some seasons of the year would be comparatively dull. And he knew, also, that if customers saw a lot of empty tables, they would begin to wonder what was wrong with his food. So he always had just enough tables barely to accommodate his trade for any particular day. Thus he threw an atmosphere of success about his establishment—by giving the impression that he is always doing a capacity business.

I heard of two rather good restaurants within sixty feet of each other in a thriving big city. One of these does a rushing business, but the other does not. Yet the prices, service, and quality of food are practically the same. The reason one is more successful is because the proprietor happens to know how to harness human psychology and make it work for him. He places his coffee urn right by the door and has a little electric fan to help blow the aroma out into the street. This appetizing smell attracts many a customer to whom the thought of eating in that particular restaurant might not otherwise have occurred.

A little retail concern selling electrical goods sent out a lot of form letters announcing special prices on lighting devices and vacuum-cleaners. Those about the lighting were posted at a time of day so that they would be delivered on the last delivery and read by artificial light—when possible prospects would be rather easily swayed by arguments in favor of better lighting conditions in the home. But the letters dealing with the vacuum-cleaners were posted at a time which would insure their being delivered in the forenoon, when the housewives were in the midst of household drudgery. This same little store specialized in electric fans. The proprietor knew that if he could only sell a fourth as many in winter as he could in summer it would mean a lot to him. So he set his imagination to work. He employed a pretty girl with luxuriant auburn hair to wash her

hair in his show-window every afternoon. Then he demonstrated how quickly one's hair could be dried by the use of an electric fan.

Doctors have found that an office filled with glass and porcelain cases, containing expensive-looking instruments, is an excellent investment, even if the instruments are never used. Patients look at them and think the doctor is prepared for the worst. Just to know that there *are* so many different kinds of instruments must, so they think, represent considerable technical education.

One doctor told me he was obliged to keep a big automobile to make calls in because other doctors did; and he should not dare to have his patients think he could not afford one—which was the precise truth of the matter. A much more sensible car for running about town would have been some cheaper make, but he had rather a society practice and his patients would have resented his pulling up at the door with any car costing less than five thousand dollars or having tires less than thirty-five inches in diameter.

A funny little scheme was used by a hotel man, who conducted a small mountain inn for summer tourists. One day, by way of perpetrating a practical joke on certain guests, he put in several mileposts, less than three quarters of a mile apart, on roads leading out from his hotel. Shortly afterward he noticed that guests who had been spending their vacations there for several seasons had a tendency to remain a week or so longer than

usual. He did not know why this was until one day a guest remarked:

"This place is doing me a lot of good this year. I can walk farther than I ever could in my life, and with less fatigue."

That being the case, the proprietor quietly left the mileposts right where they were. He also found that there was no investment so beneficial to his trade as having a good set of scales on the veranda. Many hotels had scales that required a nickel in the slot. At this place they were free. The idea was that a person on a vacation is almost certain to weigh himself if there is a set of scales conveniently near. Moreover, a person undergoing a change of scene and not at his usual work is likely to gain in weight. Or, if he is too heavy, he is likely to go in for exercise and lose in weight. In either event he will be pleased at what the scales show and will have a disposition to attribute his improvement to the excellence of the place where he is staying. And if his hotel bill at the end of the week seems high he, nevertheless, is reconciled to it and says nothing.

A great many suburban allotments have massive brick gateposts, with stone caps, at the entrance, even though there are no sewers or sidewalks; and usually the comparatively slight cost of these posts is a fine investment for the man with lots to sell. They give a touch of grandeur, which the prospective buyer subconsciously associates with the entire layout. Without realizing it, he pictures

the allotment all built up with palatial homes having winding drives, box hedges, beautiful, carefully reared children, and pedigreed dogs, on cosy verandas.

The story is told of a western railroad general manager who dropped in at one of the eating-houses provided for the construction gangs on his road, and noticed that the men were served with brown sugar. He asked the man in charge of the eating-place why they didn't have ordinary granulated sugar.

"Because this is cheaper," was the reply.

"Let's see if it is," suggested the general manager. He took a teaspoon and picked up all the brown sugar the spoon would hold. It made a little mountain of sugar. Then he tried the same thing with granulated sugar and the spoon would not hold half as much.

"You see," pointed out the general manager, "if every man uses an average of two spoonfuls in his coffee, granulated sugar is the cheaper. We must apply a little imagination when we can."

The father of former Senator Jonathan Bourne, was a shipper at New Bedford, Mass. He possessed Yankee thrift, and was businesslike right down to the fractions. One day an anchor was left lying on Bourne's dock. An employee noticed this, and, following the general policy laid down by Bourne, he made out a bill for dock rent. For the little while the anchor was there and the small space it occupied, the rent amounted to just one

cent. He mailed the anchor owner this bill. Bourne heard of the episode and made this comment:

"You used your imagination, but not quite enough. To have thought of making out the bill, even though it was small, was good business. But to have mailed a bill for only one cent, when it took a two-cent stamp to send it—that was bad business."

One of the most successful big moving-picture theaters in New York—located in the Times Square section—was started by a man who had imagination, and who consequently revolutionized picture shows. He was the first moving-picture theater man to realize the possibilities of music in that type of show house.

"It isn't only that high-grade music pleased the audience," said this man. "It is reflected in the conduct of every employee about the place. Of course every one of them is drilled in courtesy, but I don't believe one of them could do an inconsiderate act after listening to our music. Sometimes I myself come in all wrought up over something that has gone wrong and I feel like clashing with everybody I meet. Then the orchestra strikes up and I unconsciously catch the sense of harmony. In a moment I am at peace with the world. Moreover, when people hear the kind of music we provide here, they are likely to feel that they are about to see something out of the ordinary. If we have a picture that is not quite satisfactory, I work all the harder on the music, and I know from investi-

gation that when the music is exceptionally good the audience thinks the picture is better than it really is."

Occasionally one finds a farmer with real imagination. I heard of one who desired to buy land for a little truck garden. There was plenty of good land to be had near the city where he expected to dispose of his stuff, but he bought a piece of sandy soil rather than the richer clay soil, which he could have had for a little more money. Every farmer for miles around deplored this fellow's stupidity and boneheadedness for trying to do truck gardening in ground that would give only half as large a crop as clay soil.

When summer came the man with the sandy soil always had vegetables about two weeks sooner than any of his neighbors, and sold them at fancy prices, because they were a comparative novelty and scarce. By the time the clay soil gave up its larger yield, the market was flooded, and it was difficult to dispose of all the stuff at any price.

Another imaginative farmer interested his neighbors in a proposition that everybody should paint all the farm buildings at the same season. As a result the locality looked so much more attractive than elsewhere that land values had a decided boost. The paint not only paid for itself in the good it did the buildings, but actually added about ten dollars an acre to the selling price of farms thereabouts. Buyers unconsciously assumed that the land must be better, or else the farmers would not feel

prosperous enough to make such lavish use of paint.

Nobody would buy a house just because it had a little cherry tree in the back yard. But a cherry tree might be sufficient decoy to get a purchaser interested. I knew of a case where there occurred that very thing. A man had a house for sale. He advertised it and people came to look, but there were so many other houses in the neighborhood almost like it that nobody bought.

One night he told a dinner guest about his difficulty. The guest chanced to be a person endowed with imagination—and consequently was able to stir imagination in others. He strolled about his friend's little yard, and noticed a poor little cherry tree not much larger than a green bay tree, such as one used to see out in front of the family entrance of a saloon. The tree gave him an idea. He framed up an advertisement in which he dwelt on the tree more than on the house itself. He urged people to live in the suburbs and pick cherries in the back yard. No other advertisement in the paper the day that appeared contained anything to make people think of the cherries they used to pick in their boyhood days, or of the cherry pies their mothers used to make. Several persons came to look at the house. And one man promptly bought it.

He did not buy it because of the cherry tree—which was not capable of producing the filling for more than one pie per season—but simply because

the mention of a cherry tree had set him thinking of the advantages of a little yard as compared with a mere balcony and a geranium plant out in front of a stuffy third-floor suite in an apartment house. When he looked at the property, he found the location, construction, and price to be all right, and the cherry tree was entirely lost sight of. Yet, except for the writer of the advertisement knowing that the cherry tree would stir somebody's imagination, the house might have remained unsold.

Then there is imagination of an entirely different sort. One day the manager of a certain retail business sent a bill to a man who for a year or two had failed to settle his account. The bill, as made out, was for $43.18. In a day or two the man owing the bill wrote a letter protesting against the amount. "All I owe," said he, "is $18. This bill for $43.18 is preposterous. I am willing to pay what I owe, but I'll never pay any more."

The man was right; eighteen dollars was all he owed. And the store manager knew it. But he had sent him statement after statement without getting any response. So he was obliged to use his imagination and take measures which would give the man a bit of a jolt.

CHAPTER XVII

TURNING IMAGINATION TO PROFIT

Two salesmen were trying to sell a certain manufacturer a lot of machinery. The one who finally sold him did so because he had the forethought to avoid talking to him about the transaction except when the calendar was exactly right. He made inquiries, and found that the man's concern followed a custom of paying all bills on the tenth of the month. It struck him that a business man is in no mood for spending money in large slices just after writing out checks for the monthly assortment of bills. So he made it a point to present his proposition just a few days before the tenth—when his prospect had about recovered from the pain of paying off the previous month's obligations. The man's bank account was then at its highest point. Consequently the idea of spending money for new equipment seemed less repugnant to him then than at any other time.

Nearly everybody is aware that most firms pay their bills on a certain day each month, but comparatively few salesmen think to make definite use of so simple a bit of knowledge. They lack imagination.

Everybody knows that there is a great psychological advantage in actually seeing or feeling a thing over merely knowing that it is there. For example, you wish to sell a man a piece of land on a paved road, or rather on a piece of road about to be paved. The contracts for the paving are all let, and the buyer knows they are let. He has not the slightest doubt that the road will be paved within a specified time; yet he will not pay nearly so much for the land as if he can go and see the work of paving the road actually going on.

It is the same way if you offer winter goods for sale during a warm spell. Buyers know it is certain to be cold again within a short time, and that they must have various articles; but they will buy much more readily, and pay more, if need be, when they can step out of the front door and feel the chill air.

A man was trying to sell a house on the east side of the city in which he lived. He had a prospect who was half inclined to buy but who held off because he was interested in a place on the west side. This east-side man had imagination. He picked up his prospect late one afternoon, in an automobile, and suggested a little pleasure ride over to the west side. They headed toward the setting sun, which shone annoyingly in their eyes. The possible house buyer complained of this.

"If you buy over here," said the other man, "you'll have the sun in your eyes every day when

driving home and again the next morning as you drive toward your office."

And in that way he sold the place on the east side.

Automobile salesmen long ago discovered that it is unwise to have any kind of tire trouble when showing a new car to a possible buyer. The trouble may be due to running over a nail and not to any fault of either the tire or the machine; but if there is a mishap the customer has his attention shifted from the joys of automobiling to its less pleasant side, and may lose interest.

A big bond-house had an issue of bonds running from two to ten years. Those which matured in two years sold so much more readily than those which ran for ten years that the concern saw it would soon have nothing left of the issue except the long-time bonds. One of the salesmen knew a good deal about human nature and he proposed that they should raise the price on the less desirable bonds. They offered these at a slightly increased cost, explaining that it was because the investment would be undisturbed for ten years. In that way they disposed of the less saleable bonds before the others.

Book agents of the good old-fashioned kind, who sell by house-to-house canvass, are obliged to apply a great deal of psychology to their daily work. Sometimes a woman tells the agent she will take a copy of his book, but is unwilling to sign the order blank. Without her signature the order is con-

sidered worthless. So the agent, as if absent-mindedly, while he goes on talking, makes a little trough of his order blank, places a pencil inside of it, and allows the pencil to slide down the trough into the woman's lap. For some reason, when one sees a pencil lying in one's lap it requires great will power not to pick it up. Once the woman has picked up the pencil, the agent places his order blank temptingly on the back of his little sample copy and holds it before her. Often she will go ahead then and write her name on the little old dotted line before she realizes what she is doing.

The manager of the toy department of a store thought of a way to increase his sales in the course of the long dull stretch lying between Christmas seasons. He went to the public-school records in his city and got the ages and dates of birth of all children young enough to be interested in any kind of toys. Then he prepared a form letter, which he sent to parents a few days before their little ones' birthday anniversaries, suggesting that the store had a great many toys that would make dandy birthday gifts.

Parents who had always assumed, with the utmost sang-froid, that the hairs of their heads were numbered and that not a sparrow falls unnoticed, nevertheless felt greatly flattered that a big, busy store should not allow their children's natal days to pass unobserved. They went and bought toys, if for no other reason than to be polite toward such a thoughtful store.

A man in a Western city conducted an obscure little shop, where he devoted himself to sharpening knives and razors. On account of the building in which he was located being torn down he was obliged to move, and he feared that in a new place his customers would never find him. The persons he particularly wished to reach were the barbers. So he tried the plan of hiring a man to poke his head into the doorway of practically every barber shop in town and inquire:

"Where has Smith, the razor sharpener, moved to—the one who used to be down in the Behemoth Building?"

Scarcely any barber was able to answer the question. Whereupon the inquirer, following instructions, asked:

"Wh-a-a-t! You don't know where he is? Why, he's the best razor sharpener in the country, but I don't live here and wasn't sure where to find him. I heard about him from a barber in Chicago. Seems to me he has moved to the Kendall Building; but I don't know where that is."

From then on after learning that there was in their midst a razor sharpener whose fame had spread clear to Chicago, every barber in town made it his business to know where that man was located.

The manager of a big office building has the entire front wall of his building washed once in a while to rid it of its grimy coat of soot. Being located in a manufacturing city the building is soon

as dark and dirty as ever. Yet the expensive scrubbing of the outside walls seems to pay, and to pay well. By giving the building a new appearance occasionally it is not only easier to keep it rented but to keep the rentals high. As a building gets to look old there is a tendency for the rentals to drop, for tenants like a place that looks new and clean and inviting.

Moreover, there is another psychologic advantage in the cleaning process aside from the after results.

The operation of scrubbing the outside of a big building is unusual enough to attract attention and cause talk. People who do not even know the name of a building soon learn it when they see a big force of workmen removing the soot.

Tenants are slower to move into a building that has not every evidence of prosperity. For this reason building managers dislike to have ground-floor rooms conspicuously vacant, and it is a common practice to let near-by stores use the show windows of such places free of charge until they are rented, rather than have their unoccupancy attract attention.

A man who has charge of the renting of a big apartment house instructs his janitors never to place a For Rent sign in the window of any suite on the top floor. This building has no elevator in it and the upper floors are hard to rent. So, when there is a vacancy, the janitor puts his sign in a hall window on the second floor, that floor being

considered the most desirable by the average flat renter. Then, when a possible tenant calls to look at the suite, the agent has an opportunity, by force of persuasion, to rent him the vacant apartment on the top floor. In making the tiresome journey there the agent pauses at each landing to discuss something about the arrangement of the building. In that way the caller gets a little breathing time and thinks he would not mind the long climb.

It is one of the selling rules of a successful big company, which operates stores in a number of cities, that clerks shall aim to wait on boys or children first, rather than grown-up customers. At first thought this might seem like a silly policy. But here is the idea: The company specializes in sporting and athletic goods, and if they can make friends of the boys in that town they are willing to take a chance on stirring the impatience of older folks.

You see, the boy who buys only an occasional cheap baseball to-day will be buying all sorts of expensive outfits two or three years from now. And the older person, as time goes on, buys less and less of this sort of goods.

It does not require much farsightedness to appreciate that the youngster is certain to be the main asset of a concern selling goods which appeal primarily to the young. But it did require some little imagination and cleverness to know how best to make friends of these youngsters with the minimum of effort.

A certain man uses his imagination in conducting a little haberdashery. His system is the same as that of the man who makes it a point to remember people's names, only he goes a step further: he remembers where his customers live! If you ever have anything delivered from this man's store he takes personal note of the name and address, and tries to associate them together in a way that will make them stick in his mind. He can't remember them all, of course; but he remembers enough to make the system valuable to him. Consider how flattered a customer must be when this man says to him, as he starts to write out the little delivery slip:

"Are you still living out on Rockinghorse Avenue? Let me see—your number is 1120, isn't it?"

There is an appealing friendliness about a comparative stranger knowing such intimate things right offhand. Few men could fail to be flattered by it. And naturally the more flattered the customer is the more likely he is to return to that store again. He may go there regularly thenceforth, even without realizing exactly why.

I heard of a drug-store man with imagination and ideas. His store was located in a small town on the Lincoln Highway, at a point where automobile tourists were likely to be confused about which direction to turn. So he put up a big sign proclaiming that he furnished reliable road information free to all comers. He not only gained a lot of

good will in that way but sold several thousand dollars' worth of articles to those who came in to ask about the roads.

A customer came into his store one day to exchange a tooth-brush. The truth was that the brush had not been bought in that store at all. And the proprietor knew it hadn't. But nevertheless he exchanged it without a word.

"I made a friend of the fellow," he remarked, "and also sold him two dollars' worth of other goods before he left the store."

Another customer, a brand-new one, it appeared, came in after a cigar, but the store did not carry the brand he liked. The proprietor asked him all about his cigar preferences, in a kindly manner, jotted down a memorandum of the matter, and promised to put in a supply of any brand he wished. One would have thought that store proprietor had no other mission in life than to see that the customer got exactly the kind of a smoke he desired. The proprietor was smart enough to know that nothing would so quickly make a friend of a smoker as to take his cigar tastes seriously.

CHAPTER XVIII

HANDLING PEOPLE AT HOTELS

MORE imagination is required in conducting a successful big hotel than in almost any other line of business. People seem to exhibit a greater variety of traits and characteristics at a hotel than elsewhere. In the first place, they desire to live better at a hotel, in many respects, and have more done for them, than they would at home. They realize that they are buying not only food and lodging, but service, and there is likely to be a variety of interpretations among guests as to what really good service is.

A man at a hotel alone does not behave like a man who is accompanied by his wife. The one with his wife along appears to be more complaining and more difficult to please. This is largely because the wife, being in the hotel more than her husband, in the course of the day, and knowing more about the little details of good housekeeping, may notice things that would escape her husband's attention. Then she tells him about them,—perhaps in an if-you're-a-real-man-you'll-have-this-remedied tone,—and he feels duty bound to go to the desk and enlighten the clerk about the inferi-

ority of the service. Furthermore, a woman is often more insistent than a man on getting one's money's worth.

Nearly all well-managed hotels at the present time make especial appeal to women; moreover, hotels have grown better and more homelike in proportion to the number of women guests attracted within their doors. And the hotel that attracts women is also fairly certain to attract men. If somebody could run a mammoth hotel for men only, and keep it filled to capacity, it should be the most profitable hostelry in the world, because men are about a hotel less than women and require much less waiting on, which means fewer employees. Yet how many successful large stag hotels have you ever heard of? When you see a stag hotel it is altogether likely to be rather small and unpretentious. The answer is that the average man, even though he has no notion of being in the company of any woman in particular, nevertheless prefers to be at a hotel where he sees women about him. Sometimes I am half inclined to think that perhaps there may be some actual attraction between the two standard sexes.

Most hotels follow the theory, first laid down and capitalized by the late George C. Boldt, that the guest is always right. Boldt would not even employ former salesmen in any position of consequence at his famous hotel. He confided to me one time that he was particularly averse to employing anyone who had ever been a life insurance

salesman. The reason for this was that, because a salesman is accustomed to try to force his own ideas and his own desires on others, he might be tempted to try the same thing on a hotel guest, whereas the guest is most content when he is doing what he himself prefers. Everybody has had the annoying experience of dealing with a waiter who is too insistent on selling the customer what *he* thinks the customer should eat. A hotel is really no place for the old-fashioned kind of salesmanship consisting of the ability to convert a customer to the salesman's point of view. If a guest does not like his room it is poor salesmanship to try to convince him that he *should* like it. The only wise plan is to agree immediately—with the utmost cheerfulness—that he ought to have a different room, and hasten to get it for him.

Another thing that Boldt insisted on in his employees was the quality of being observant. When about to hire a man even for an unimportant position Boldt was not unlikely to send him on some errand to another part of the hotel, in order to see if he had this qualification. By the time the man had walked twenty feet, Boldt ordinarily could tell. If the man walked with his eyes straight ahead, paying no attention to anything about him, Boldt decided that he was not observant. When in doubt, Boldt would ask the applicant, casually, about things he passed while on his errand. Did he see the woman in the velvet dress wearing the blue hat? And was there a folded

newspaper lying on the floor near the lounge? If the man had been conspicuously unobservant Boldt would not hire him.

When a certain large hotel was opened in New York a few years ago, the manager appreciated that merely to provide excellent service would not be sufficient inducement to attract the guest in the habit of going to some other hotel which also offered excellent service. All other things being equal, a man would rather go to the hotel where habit has made him feel most at home—where everything looks familiar. The only trouble with perfect service is that it attracts no attention. When a man is satisfied with a thing he gives little thought to it one way or the other—just as a man never appreciates what a good little stomach he has when it is working perfectly. Similarly, he accepts an immaculate hotel room and good food as a matter of course, and the service makes no impression on him; but a lack of clean towels or failure to receive a telephone message cuts a little notch in his memory. So, decided this wise manager, the only way to impress on a guest that he is being well looked after is to give him super-service; that is, excellent service rendered in such a way that it will stir a man's imagination.

For instance, a guest at this particular hotel orders food brought to his room. When the tray comes it probably has on it not only the food but a rosebud in a little vase. No matter whether he cares for flowers or not, the guest recognizes that

it was thoughtful and clever of the management to send him that nice little rosebud. He thinks that is good service. Then it suddenly flashes upon him: "Why, the service here is *all* good—remarkably good!" He remembers little items of high-grade service which he had previously accepted as a mere matter of routine. You see, his imagination has been awakened.

The manager of a string of several famous hotels hit on the plan of placing a newspaper at the door of each guest-room in the morning. The cost of papers to the hotel is trifling, but each guest is saved calling on the telephone for the paper to be sent to him, and he is saved also the strain on his temper of having to give a bellboy ten cents for bringing him a paper worth only two cents. He feels so kindly toward the management for putting that paper at his door that he doubtless might be willing to overlook some item of inferior service if, by chance, any should occur.

When this manager took charge of a great New York hotel, he tried another innovation. Instead of charging three cents for a two-cent newspaper at the hotel news stand in the lobby, he charged only two cents—the price fixed by the publishers. Think of the ill will hotel managers in New York and elsewhere have stirred up by adding that extra penny to the price of a newspaper! The profit derived in this manner is small at best, and the resentment it stirs in many guests must cost hotels thousands upon thousands of dollars. How short-

sighted then must be the average hotel man in refusing to buy good will when he can have it for one penny!

When a guest remains a week or longer at one famous hotel, he finds in his room a bouquet of flowers or a box of candy. This little present doesn't amount to much in itself but serves to make the guest feel as if he had become an old and valued friend—as if he were now one of the inner circle. When he comes to town again he has a sort of homey feeling toward the place where the manager sent flowers to his room. Such courtesies cost little, but they are the mortar between the bricks in the solid wall of good will.

This same hotel also has its clerks instructed to send flowers to the room of any couple who are on their honeymoon. If in doubt—but an experienced hotel clerk rarely guesses wrong on such a matter—he sends the flowers anyhow. Naturally there is nothing in the whole big wide world so noteworthy to a honeymoon couple as their recent marriage. To have a hotel manager recognize the importance of the event by sending flowers convinces them that he must be an extraordinarily wise and capable hotel man, and that they have come to the right place. So far as they are concerned, they trust that their children and their children's children will stop at that same hotel.

Here is still another way in which a hotel man made capital of his knowledge of every-day human psychology. In each room he has a little pad of

paper on which is printed a request that guests jot down any criticisms of the service. That seems like a simple, inconsequential item of hotel management, but here is what happens: A guest has a real or an imaginary grievance. He goes to the little pad and writes it down. Having written it, he finds that most of the feeling of dissatisfaction is out of his system. Frequently he tears up the slip of paper, because the complaint looks trivial in black and white, and writes down instead something in the way of praise for the service—something that he would never have thought of except for the little complaint-pad being there on his table. If the dissatisfaction is justified, the trouble is remedied—which not only gains the favor of the one making the complaint but of other guests who might come and be annoyed later on over the same thing.

I once overheard a hotel proprietor calling a recent guest over the long-distance telephone to tell him of a message that had come after his departure. And the hotel man did not even order the charges reversed. I asked the man if it was not unusual for a hotel to extend such a favor at its own expense.

"Perhaps it is," he replied, "but wouldn't you do it for a man who had been a guest in your home? Then why shouldn't we do it all the more readily for a guest who pays us money?"

This same man also expressed this view: "I think the greatest mistake that is commonly made

by many hotel people, both employees and managers, is to exert themselves more for the comfort of an old-time guest than for a new one. According to all rules of hospitality and logic, the person who should receive the most effort for his entertainment within one's doors is the newcomer.

"In your own home you would not think of making a great fuss over a man who had been entertained there before, and more or less ignore another fellow who is receiving your hospitality for the first time. The one who has frequently been beneath your roof is naturally more or less at home, but the newcomer feels strange and ill at ease. He is in need of the little attentions which make him glad he came and give him the desire to return. There is no reason why this common-sense rule would not apply just as much in a hotel."

A number of young women employees from a near-by business institution were in the habit of dropping in at a famous little Fifth Avenue hotel for luncheon. It never occurred to them that their modest trade would attract the attention of the manager. But one day he graciously asked them if it would be agreeable for him to give them a little dinner as a slight token of his appreciation of their continued patronage. The cost of the dinner was comparatively little to the management, but those young women will probably talk about it and send friends to that hotel as long as they live. On the other hand, the type of guest who is in the habit of buying expensive dinners would probably think

little of having a dinner given for him. He would be more accustomed to such things. The hotel manager was clever enough to know this. His dinner to those working girls was better business than giving a dinner to as many multi-millionaires.

The hotel man who ignores the caprices of human nature runs the risk of finding himself away out on a limb. Once while staying at one of the smaller New York hotels, the young woman with whom I was sharing a room—my wife—chanced to peek out of a window, and saw a lot of harmless rubbish—paper sacks, an old collar, and such things—lying on top of a skylight at the bottom of a court. From that time on she would not eat anything in the dining room of that hotel, and she left sooner than she had intended rather than stay there.

Her contention was that, though the bits of rubbish did no harm, they showed a tendency on the part of the management to be careless about dirt, so long as it was in a place not easily seen. Following this argument to its logical conclusion she was certain that the kitchen was dirty and that food from there was not fit for human consumption. The truth was, as I later learned, that the kitchen was immaculate. It was, for the most part, a well-conducted hotel. The trouble was that the manager lacked imagination. He could not see the harm that might come from a few paper sacks lying at the bottom of a court.

One of the most frequent whims of a hotel guest

is the desire for a certain room, the identical room he had before. Even seasoned travelers forget that it is impossible to hold some particular room ever in readiness for the possibility of their coming. In order to meet this demand, in so far as possible, smart hotel men find it advisable to have many rooms exactly alike in size and arrangements—so that a guest in one room cannot make comparisons with the one he had the time before, and feel discontented.

It isn't that one room is better than another. The whole thing is psychological. A guest comes to town and has a pleasant or profitable stay, and he looks back on that trip with such satisfaction that when he returns he wants everything exactly as it was then—even to his immediate surroundings.

CHAPTER XIX

CAPITALIZING COURTESY

As I strolled along Fifth Avenue, in New York, one afternoon, I remembered that I needed a collar—just a simple little soft turnover collar.

I caracoled into the nearest haberdashery and frankly told a young clerk what I had come for. He seized a little box off a shelf, and deftly drew a collar from a cute little tissue-paper envelope, while quietly humming a simple tune.

"That's the very latest thing," he sighed, at the same time significantly tapping with his index finger the collar that he himself wore. There was no denying that the two collars were of the same identical pattern.

I was really rather captivated by the collar and inquired the price.

"Those are a dollar each," the young man replied, as he suppressed a yawn.

Now, as a matter of fact, I never pay one dollar for a collar. So I freely admitted to the salesman that I was seeking merely a twenty-five cent collar, and was unwilling to pay a dollar, even though the collar he had just showed me did, indeed, make him look very neat and attractive.

At the mere mention of the words twenty-five cents, the clerk looked deeply vexed.

"Ah," said he, with a smile of mingled pity and amusement, "we have no such collars as that. We don't *touch* them." And he made a deprecating gesture with his left hand, palm outward, as if the very thought of such a collar was repellent to his sensitive nature.

"You won't find any cheap collars on Fifth Avenue," he added, busying himself putting away his stock, as if the incident were closed. I gathered from what he said that I might just as well try to find the mythical pot of gold at the end of the rainbow, or try to solve the problem of how to eat one's cake and have it. If that clerk should ever find out that I did succeed in buying a first-rate, wearable collar for twenty-five cents, only three or four doors away on Fifth Avenue, I imagine it would spoil his day.

In the second store I tried, the clerk told me they had no soft collars for less than seventy-five cents, but instead of seeming irritated that a customer should appear in quest of a less expensive collar, he was apologetic.

"We have a great many customers who are heavily infested with money," he explained, in a friendly, confidential tone, "and they think unless a thing is priced at an absurd figure it can't be any account. You can get just as good a collar as any white man needs, for a lot less money."

You may think that this second clerk went

almost too far in taking the customer's point of view, but I contend that he was an unusually efficient salesman—efficient because he was courteous. Just because he had the politeness to shift his mood to fit mine, I was half tempted to buy one of his costly collars, after all. If I ever *should* decide to pay more than a quarter for a collar, I have an idea I would rather squander my money with this second clerk than with the first one. He applied the same rule of courtesy that governs the dinner host who will not wear evening dress if he thinks one of his guests will be less properly garbed. If one should place his guest at his ease, a guest who merely comes to eat food, why should one not go even farther—looking at the thing from a purely business viewpoint—to place at ease the man who enters one's store for the purpose of spending his money?

Strange to say, genuine courtesy, taking it as a general proposition, is a comparatively new thing in business. It has been only a few years since business men stumbled upon the discovery that customers are more likely to return after a slap on the back than after a kick in the stomach.

Take for example the railroads. The famous "public be damned!" policy governed railroads for a great many years, and a large ratio, if not a majority, of those railroad employees who dealt directly with the public were a crusty lot. They were never told, or given the slightest incentive, to be otherwise. The consequence was that dis-

courtesy has cost railroads in this country millions of dollars.

The woman who made an occasional railroad journey did not know the president of the road and had no way of ascertaining whether or not his personal policy was one of courtesy. Her only knowledge of railroad people was gained from her dealings with the ticket agent, conductor, brakeman, or baggageman. When they failed to treat her politely she resented it and began to hate all railroad men, including the higher officials and the stockholders. She taught her children to do likewise. When they grew up and found an opportunity to give a wallop to a big railroad corporation they delighted in it.

It was years before the railroads realized what a vast annual sum of money they were paying for the discourtesy of their employees. When they did finally awaken, however, they had the good sense to start a campaign of education among the employees by means of straight advertising methods. They printed and distributed courtesy literature and carried on such a vigorous courtesy propaganda that the employees were gradually converted—just as they might have been won over, by the appeal of effective advertising, to a new kind of political viewpoint, or to a different brand of suspenders. To-day the average railroad employee is reasonably courteous.

The New York, New Haven & Hartford Railroad, once noted for its wrecks, and looked upon

as the final word in disregard for public opinion, under a newer management made an elaborate campaign for gaining esteem. In one of the circulars distributed to its employees, the company says: "Good service depends upon good will given and good will received." In another is an order that "Employees must not enter into any dispute with passengers, no matter what provocation may be given."

The Père Marquette road tells its employees: "In many cases the local agent of the company is the sole representative in the town where he is located. The estimate put on this man by his fellow citizens must be the measure of the company's popularity or unpopularity."

Not so long ago an employee of a Southern railroad insulted a colored woman at the union station in Memphis. She was only a poor woman, but the jury took the view that she had feelings, and had suffered enough humiliation to warrant taking balm of three thousand dollars from the railroad. No such verdict would have been awarded, however, if the members of the jury, too, had not at some time had experiences which made them more or less resentful toward railroads in general.

No one knows how long the enactment of provisions for a parcel post in this country might have been delayed—to the great advantage of the express companies—except for the fact that the express companies had for years exhibited a gross

indifference to the rules of business courtesy. Anybody who ever lost an express package in the old days and suffered the well-nigh interminable delays incident to getting proper redress can readily testify to this. The express companies themselves forced the demand for a parcel post.

I used to notice this: If you went into the average express office, wrapped up a book for shipment right before the eyes of an employee—so that he must have known the article was a book, and not canned goods or some other commodity—and asked him for the rate, he would give you the rate on ordinary merchandise, which in most cases was higher than the book rate. If you then asked, "Is that the book rate?" he would say, "Oh, you want the book rate?"

Unless you knew to ask definitely for the book rate, you might pay a higher charge for shipment, even though the clerk knew it was a book you were sending, and that you were entitled to the special rate provided for such articles.

Obviously, there is no limit to the harm that may be done by even so slight a discourtesy as mere inattention on the part of an employee. I heard an angry woman notifying the floorwalker in a big department store that she had waited three or four minutes to be served, and a girl, though not busy, had failed to notice her.

The floorwalker was unable to pacify the customer, and she never went to that store again.

Before that her trade had amounted to more than one thousand dollars a year.

I know of a department store that is believed to be financially on the ragged edge though it was once about the most prosperous institution of its kind in the city where it is located. And I believe I could put my finger right on the main contributing cause of its loss of popularity. It has just as good a line of merchandise as could be found anywhere, and the prices are reasonable. But if you buy a rug, a chair, or an alarm clock at that store, and after taking it home decide that you wish to exchange it, you will meet an atmosphere of deep gloom on the part of those store employees who participate in the transaction. Mr. So-and-so has to go and see Mr. Somebody-else before the charge for the returned goods is taken off the books. Everybody examines the goods very critically, as if to say, "I don't know about this."

The customer says to himself, "I hope I don't have to go through all this monkey-business soon again."

Other big stores in the same city are just as careful about making sure that things returned are in good condition, but they do it in a hail-fellow, offhand way that makes the customer feel as if he is causing nobody any trouble whatsoever.

Years ago the big telephone companies replaced the unconventional "Hello" of the central operator with the more polite phrase, "Number please." More recently they discovered that the

word "please" repeated several million times a year delayed messages and really cost a lot of money. So operators now inquire merely, "Number?" But they are under rigid instructions to say the word with a rising inflection on the second syllable, which gives a cheerful, chipper sound to the inquiry, whereas the word with a falling inflection at the last makes it sound as if the operator is somewhat bored with her job, if not actually dissatisfied with world conditions generally. Moreover, the big telephone companies, in hiring a girl, do not consider the beauty of her face or figure, as most of us would if engaging a stenographer, but insist that she must have a pretty voice.

A big retail concern with more than one thousand stores over the country insists upon its salesmen acknowledging every purchase, no matter how small, with a "Thank you. Come again," or something like that. No matter what a customer does, this company insists that he must not be insulted. He must never leave one of their stores with the lightest feeling of resentfulness, even though he himself may have been at fault. For example, salesmen have special instructions in case of receiving counterfeit money. If a customer presents a lead quarter, the salesman must not chide him for doing so, but must offer sympathy, telling him that there is a lot of counterfeit money in circulation lately and that he evidently has been imposed upon by somebody. The theory is that it is better to let a guilty counterfeiter escape than to

take a chance on making an enemy of an innocent customer.

It is doubtful if any line of business offers so many opportunities for turning courtesy to profit as the hotel business. One of the first men to realize this fact and apply it on a big scale was the late George C. Boldt. At his death, Boldt was regarded as the greatest hotel man of his time. And he believed that by far the greatest single factor in his success had been his policy of never-failing courtesy.

"Courtesy is the cheapest thing in the world if you provide it yourself," Boldt used to say, "but it is the most expensive thing if you try to buy it."

Boldt entered the hotel business as a 'bus boy and later on was manager of a little hotel in Philadelphia called the Bellevue. A number of New York people got into the habit of going to that hotel occasionally when they wished to obtain quiet and rest. One of these New York customers wrote a letter to Boldt one day, somewhat as follows:

My wife is in an extremely nervous condition and must get away at once from everything suggestive of her household cares. She doesn't want to go anywhere but to your hotel, and will have nothing but the room she has occupied heretofore. That will not give her the change of scene that she needs, but I guess it will have to do. We arrive to-morrow afternoon.

When they arrived, the guests found that Boldt had done a lot to that room in twenty-four hours.

It was repapered and repainted, had new chandeliers, new carpet, and different furniture. Everything about the room that it was possible to change had been changed—all within one day. Such transactions as that gradually gave Boldt a reputation as one who would go a long way to accommodate a guest. The story has been told that one night, when all the hotels in Philadelphia were crowded and it was almost impossible to obtain a room, a man and his wife drove up to Boldt's hotel and asked, in a tone of despair, if he could not give them a place to sleep.

"Yes," Boldt told them, "you can take my room—that's all I have."

The next morning, according to the story, the guest told Boldt that a manager with his sense of courtesy would be an assured success in a much larger hotel.

"And," added the guest. "I'm willing to provide you with the hotel."

That same guest later invested many millions of dollars in hotels under Boldt's direction. For the guest was William Waldorf Astor.

Boldt's strict rule, that the guest is always right, is the rule in most good hotels to-day. For example, let us suppose a guest tastes an order of fish and tells the waiter it isn't good. The waiter is absolutely certain the fish is really all right, but under no circumstances must he ask, "What is wrong with it?"

He must whisk it away and inquire, "What shall I bring you in place of it, sir?"

Boldt had brought to his desk each day a list of all guests who were ill. If the illness was of any consequence—enough to keep the guest bedfast for more than a day—Boldt was quite likely to go to the room and make personal inquiry about the guest's progress toward recovery. If it was a woman he usually sent a bouquet of flowers.

I once heard Boldt talking to a middle-aged woman who had been at his hotel before and with whom he had a slight personal acquaintance. He inquired how she liked her room.

"All right," she told him, "but I've never got a room with such a comfortable chair as a little rocker I had the last time I was here—about a year ago."

Within thirty minutes Boldt had found what room the woman occupied on her previous visit, what furniture was in it, and had placed the same little rocking chair at her disposal.

In one of the first-class small hotels in New York, where the trade is of a less transient nature than at most of the larger places, all bell-boys, elevator boys, and the head waiter are required to know each guest by name, if the guest remains longer than a day. It is a small courtesy, but extremely flattering to the guest. He feels as if he must be a person of no inconsiderable importance. At another hotel, scarcely a block away, if you order breakfast sent to your room, there will

invariably be no water on the tray. When you ask for water it is brought not by the waiter who carried in the breakfast, but by a bell boy. Hence you must tip the waiter and also the bell boy. It is an arrangement among the employees which the management seems to wink at, and which comprises a discourtesy to which guests are *not* entitled.

As an example of the difference in hotels, I must cite the experience of William L. Ross, a bond man, of Chicago. Within the same month, Ross made two trips to New York. He went to two different hotels, each having the same scales of prices, equal quality of food, and, to all appearances, one just as good as the other. While at the first hotel Ross received a call from a man with whom he had important business. He was in his room at the time, but in some way the telephone operator failed to call the right number, reported that there was no answer, and Ross failed to see his man—with the result that he nearly missed making a deal involving thousands of dollars.

On the next trip he went to the other hotel. The clerks there had never seen him before and did not know his line of business. Not long after his arrival, a number of telegrams came for him, and five or six letters. The hours went by, and Ross did not come in to claim his telegrams. It occurred to the clerk—a super-clerk he must have been—that Ross should see those telegrams. They might be of the utmost importance. The letterheads on two or three envelopes indicated

that Ross must be engaged in the bond business. So the clerk put in telephone calls of inquiry at various places in the financial district on the chance of getting track of Ross. And it so happened that he found him.

Ross has never got over being impressed with that, and, as he is a rather gifted talker, it would be difficult to estimate how much good he has done that hotel through conversational advertising. It was a striking example of courteous efficiency and efficient courtesy.

On the other hand, I recall an experience at a hotel in Toledo. One morning, while a guest there, I asked the porter to find out if a certain train I wished to take was on time. The porter called up somebody and told me the train was two hours late. So I laid plans accordingly and idled away an hour listening to the conversation of a newspaperman named Patterson. Then I went back to the hotel, asked again about the train, and the porter told me it had gone—gone out only five minutes late. I went at once to the manager's office in a high state of vexation. He smilingly explained to me that they often got train reports from irresponsible persons at the station, but as the hotel made no charge for giving out the information—doing it simply for accommodation—they could not be responsible for errors. And he went ahead opening his mail. So far as he was concerned the incident was closed. He felt conscience-clear in the matter and was per-

fectly willing to dismiss the affair with a wave of the hand.

I submit that this man, because of his lack of imagination, will never be a really successful hotel manager. He should have seen at once that nothing would so irritate a guest as getting information from a hotel that would lead to his missing a train and perhaps losing a day's time. That sort of thing, if it happened often enough, would make so many people disgruntled toward the hotel that it might go on the rocks.

Either a hotel management should spare no effort to make sure that such information is accurate and dependable, or else it should refuse to give out any facts about trains at all, and thus avoid being a party to a thing which may so seriously discommode a guest. The hotel manager's weakness as an executive was proved not so much by the fact that faulty service occurred, as by the fact that he didn't immediately regard it as inexcusable.

In contrast to the hotel man's attitude was that of a drug clerk I met only a day or two later. I went into the drug store for the purpose of buying a postage stamp—just a modest little one-cent stamp. The clerk took my nickel, got four cents in change, and said "Thank you," with as much genuine courtesy as if the sale had netted a thousand dollars' profit. Before leaving the store I got into conversation with the proprietor, and he explained to me that showing such courtesy over

the sale of a stamp did not merely happen. It was part of their system.

"The only reason we sell stamps at all," said he, "is to accommodate those who come in here—to make them want to come again. So long as we are going to accommodate them, why not please them just as much as we can and make friends of them? It would be silly, wouldn't it, to set out to accommodate somebody and do it so discourteously as to insult him? Yet I have seen drug-store clerks sell stamps in such sneering fashion that the buyer would be foolish ever to enter the store again."

In my native town is a grocer whose hobby is to be accommodating. One afternoon a woman telephoned a hurry order for some articles that she wanted delivered immediately, as she was giving a party. She chanced to mention what trouble she was having trying to get some rich Jersey cream, which she greatly desired. The grocer did not sell cream, but he dispatched his own automobile to a farm three or four miles away and got a quart of the best cream to be had in the county. In less than an hour he had delivered it to the gratified woman. The profit on it did not pay for the gasoline used in bringing it in, but he made not only a lifelong customer but also an enthusiastic lifelong rooter. He has been doing that sort of thing so long that the town is thick with women who, when they foregather, like to talk in excited tones about what a lovely person Henry Fetz is to

deal with. Such talk is the best advertising he could buy. And it doesn't cost him much beyond a little quiet use of his thought apparatus.

Various public service corporations such as gas and electric light companies used to ignore complaints or else regard them in a "what are you going to do about it" attitude. To-day every such concern has at least one man on its staff who draws his salary because of his ability to control his temper and maintain a calm unruffled poise in the face of insults. He goes to persons who make complaints or are mad at his company, and attempts to educate them to the company's viewpoint.

This plan seems to discourage complaints for more reasons than one. For example: I am obliged to live part of each year in an Eastern city where rates for electric light seem preposterously high. Just as a matter of form I used to write a letter about once a season telling the company frankly what I thought of it and its light rates. Every time I wrote such a letter, the company sent to me, more in sadness than anger, a young man with whom time seemed to be no object. He would sit in my office for an indefinite period telling me at great length, in the most courteous manner imaginable, why it was necessary for his concern to charge more than I thought reasonable. After three experiences of this sort I ceased to write letters of protest to the company. Their polite young man had conquered me. I did not wish to take a chance on having to hear his long story all over

again. So I pay my light bills now with every outward appearance of cheerful resignation.

Another company I know of has a habit of asking when anyone comes into the office with a complaint, "Would you like to see the general manager?"

It is surprising what a lot of people will then minimize their complaint. The moment the company regards it seriously—seriously enough to have it taken up not by a subordinate but by the general manager himself—the disgruntled customer has a tendency to feel that the complaint isn't so important after all.

One does not have to look back many years to recall the days when letters directing attention to accounts overdue were sharp and to the point. Today such letters usually begin something like this:

"This account has doubtless escaped your attention"—and so on.

A big firm which employs a great many collectors makes it a practice to inquire of these collectors every day:

"How many new friends have you made for us?"—placing more importance on this than the number of accounts squared up.

Even in the matter of the treatment accorded the caller who stays too long in one's private office, the last few years have seen a great change. The old way was to begin to fumble with the papers on one's desk and look extremely bored, as a signal for the visitor to go.

Now the smart business man who knows the value of making friends of everybody and offending no one, presses an invisible button for a stenographer or clerk who comes to the door and says:

"I beg your pardon, Mr. van Doe, but are you forgetting that committee meeting at ten o'clock?"

The visitor then goes away with the feeling that he would have been welcome to tarry a great deal longer except for unforeseen circumstances beyond the other man's control.

So it goes. It probably is not overstating to say that the time is coming when practically every business representative in the land will extend courteous treatment—with the possible exception of ticket sellers in the theater box offices. They, for some reason, seem reluctant to fall into line. Go into almost any theater where the attraction is a big hit and the house is selling out at each performance and note the irritating air of cockiness with which the man tells you that there are no seats to be had.

The box office man has not yet learned that it is human nature to resent stereotyped phrases. Let a woman go up to a box office and inquire if there are any seats left for one dollar and a half, and instead of saying simply "No," and looking her in the face when he says it, or, "No, nothing under two dollars," he replies, importantly, while

busying himself with a hangnail: "Two dollars and two and a half."

The distinction is slight, of course, but it is the ability to give the delicate shadings just right that makes the artist.

CHAPTER XX

HONESTY IN THE AVERAGE MAN

ONE of the best ways to keep the average man honest is to make it either needless or impossible —or both needless and impossible—for him to be dishonest.

The big surety corporations, which make a business of gambling—in a sense—on men's integrity, find that honesty is much less a matter of pedigree than of environment, less due to temperament than to temptation. In other words there is a definite relation between dishonesty and temptation and necessity. A certain number of average men in a thousand, if they need money urgently enough, and the temptation is inviting enough, will prove to be dishonest.

A certain big wholesale concern had in its employ a young clerk whose duties included going to the bank at the close of each day's business and depositing large sums of money. The young man received only eighteen dollars a week. Time went on and he got married; but he received only eighteen dollars a week even then. He required more money. His salary was not proportionate to the responsibility his employers placed upon him.

Moreover, they did not audit his books for months at a time. Thus, he found himself ensnared, through no fault of his own, in three of the chief factors which make for dishonesty—need of money, constant temptation, and opportunity to take money without immediate danger of being caught. And one day he found himself in serious trouble.

The manager of a big trust company's safety deposit vaults robbed a famous rich woman in New York of $65,000 worth of jewelry. He was forty-two years old, had a wife and two children to support, and held a position which carried with it a good deal of responsibility. Yet his salary was only $33.50 a week.

One of the women guests at a fashionable house party in an eastern city, left lying carelessly exposed on her dressing table a lot of expensive jewelry—partly, I believe, because it tickled her vanity to exhibit a so-called rich and careless attitude toward costly articles. Her husband chided her for leaving her jewelry out where it would be a temptation to maid-servants, but she paid no heed. And a servant girl took a pearl necklace worth three thousand dollars. After the necklace was recovered, the owner forgave the girl, but the girl never forgave the society woman for placing temptation in her way. The jewelry lay before her just at a time when she was in sore need of money. She had never stolen before and probably never will again; but all her life she will be obliged to live with herself, knowing that there is a blot on

© *American Magazine*

Dishonesty often is due less to temperament than to temptation

her character. From her point of view she has a greater grievance than the woman she robbed.

Surety companies are to-day making men more honest, first by insisting on restrictions which will make dishonesty difficult, and also by impressing employees with the futility of trying to escape punishment for wrongdoing. An individual may forgive an erring employee, but the system of the surety company includes tracking him relentlessly, around the world if need be, until he is brought to justice.

In the old days, when a man entering a place of responsibility required a bond, he went to a friend and persuaded him to sign it. Nobody likes to sign such a bond; but it is embarrassing to tell an old friend that you fear he may some day take a sudden notion to steal. Yet a year or so later the obliging bondsman may face the necessity of making good a defalcation. And nothing is much more annoying than to glance up from one's breakfast food at the morning paper to learn that a man whose bond you have signed has gone wrong.

The surety companies now relieve individuals of embarrassing bond-signing and protect employers against loss through dishonesty of employees in much the same manner that insurance companies guarantee persons against loss by fire.

Obviously, the surety companies must make their work profitable to themselves. They must take in more money in premiums than they pay out in losses. In other words, they must be able to

tell in advance that the majority of persons they bond will remain honest. And how is that to be done? How is one to tell an honest man? What are the advance clues to possible dishonesty? If every employer and every person dealing with human beings knew these things it might be a great help.

Certain conditions have such a strong tendency tb make for a record of honesty that a surety company is willing to go just by what they can read about a man on the little dotted lines on an application blank. They rarely see the man for whom they provide a bond. They do not know what he looks like. If his record on paper is all right they take a chance on him.

A great many persons have an idea that dishonesty is more or less hereditary, that some men are born thieves. The surety companies pay no heed to any such theory as this. They do not even ask in their list of questions if an applicant's father or mother ever chanced to fall into the hands of the police. If a man's personal record is satisfactory, having had a few burglar forbears in the family tree seems to be of scant consequence.

In brief, if a man has been honest for the last ten years, is known to be living within his means, and is engaged in work that does not offer too many temptations and encouragements to dishonesty, he will usually continue to be trustworthy.

The man who changes his job too frequently bears

investigation. Perhaps he changed because he kept outgrowing his position and getting something better each time. But, on the other hand, he may have changed for some distinctly other reason, which one is entitled to know before trusting him too far. A surety company usually has an applicant give a list of all employments for several years previous. If he has been in business for himself part of that time he is asked to give the dates and places, and these are carefully verified. In case the dates do not all check up properly and there appears to be a dark period or episode that the applicant is trying to cover up, this detail is, of course, looked into.

Where there is no gap in a man's list of employments, that is, no period of his life when he was not following some occupation and giving satisfactory service, he is probably a reasonably good risk.

One surety man told me that if he were permitted to ask an applicant only one question, it would be to give a list of all places of employment for ten years back. If the man has done nothing criminal in that time, but is nevertheless ashamed of something, and omits or tries to hide the facts, his record when checked up will reveal that he has not been frank. And the man too conspicuously lacking in frankness is, usually, not above suspicion.

Certain questions, which seem rather trivial, are really of major importance in trying to determine the probability of a man's remaining honest. One

question which is usually asked is the number and relationship of persons that the man entirely supports. An unmarried man, while requiring less money, is a much more hazardous risk than a man with family ties. Not only is a married man less likely to fall into mischief, but he does not wish to do anything which might bring disgrace upon his wife. If he has both wife and children, this is even more true. It is an unconscionable man, indeed, who does not shrink from the idea of having his children gibed and twitted about the fact that he is their father. But if a man has more children than he can properly support on his salary, he faces a constant need for more money, and this need may lead him into devious paths.

When a man has an actual legitimate need for more money with which to provide the ordinary comforts of life for those near and dear to him, and if he believes he is underpaid by his employer, he may find a way to square things with his conscience for helping himself to whatever he thinks he ought to have. He is really a dangerous man to have around.

There was a case in New York a while ago in which a young man was so brazenly frank in his attitude regarding his appropriation of funds, that he not only succeeded in keeping all the money he had stolen but escaped all chance of punishment and compelled his employer to make up the shortage out of his own private funds. Here is the story:

A big concern had a bookkeeper who was obliged to work long hours at low wages. This bookkeeper was bonded by a big surety company for five thousand dollars. One day the man's employer came to the office of the head of the surety company, and told him that the bookkeeper had taken three thousand dollars of the firm's money. He wished to be reimbursed under the man's bond. The official gave him blanks to fill out at his leisure, with the request to itemize the amounts stolen, with the dates, and promised to arrange for a quick settlement. The next morning the bookkeeper himself appeared at the surety company's office. He was a neatly dressed young man with a rather agreeable personality, and perfectly at ease.

"You won't have much respect for me," he told the official, "because I have played my employer a low-down trick. I did it willfully and maliciously. I am a dishonest man. But for years I have had to work from early morn until seven at night for less than I am worth. The amount I have taken just about makes up what I should have had in salary for the last ten years. What I came to tell you, though, is this: You're not going to lose any money on my account. You won't need to pay anything on my bond. I'll see to that. Just have my employer make out the papers asking for reimbursement on my bond, and then send for me. I'll guarantee you that you will not lose a cent."

The official had a sense of humor and the situ-

ation appealed to him. He grew interested in seeing it through.

After the employer had signed the form in which he had itemized the bookkeeper's shortages, the bookkeeper again came on the scene and explained that the money he had taken did not belong to the firm which had bonded him at all, but was taken from the funds of a church of which his employer was treasurer. He had become disgruntled over having to work after hours on the books of this church fund without extra compensation, and decided to use part of the pew rent for his own purposes. The bond covered the young man's position as bookkeeper, and not as acting treasurer of the church. So the bookkeeper went to his employer and told him:

"If you attempt to collect that money from the surety company, or to have me arrested, I shall have you arrested for trying to rob the surety people. And unless you make good the shortage to the church, I'll report the whole thing to the church trustees."

And the employer was obliged to do just that.

The employee's attitude was, of course, not commendable. But the point is that he was underpaid, and had come to a state of mind where he thought his act was justifiable. A man in that position is not a good risk.

It is for this reason that a surety company is inclined to ask more questions of an employer than of the employee to be bonded. Here are a

few of the most important questions they put to the employer:

What salary will the applicant receive?

How much cash, if any, will he have in his custody at any one time?

If required to make deposits at the bank, how often?

Will he be authorized to sign checks?

To whom and how frequently will he account for his handling of funds, stock, or securities?

What means will you use to ascertain whether his accounts are correct?

How frequently will they be examined?

What will be the title of the applicant's position?

The whole plan, you see, is to learn if the man is going to receive a salary proportionate to his responsibility, and if there are sufficient checks on him to discourage him from being dishonest, even if he were otherwise disposed to be.

The last question at first glance seems needless. What does it matter, you ask, what a man's title is, so long as he is performing a certain kind of work? But here is what sometimes happens: A concern will have an underpaid employee and will seek to satisfy him largely by giving him a pretentious title rather than by paying him more money.

For instance, I knew a man once who was working as bookkeeper for twenty dollars a week. One day his company conferred upon him the title of auditor and raised his pay to twenty-two dollars

a week. His duties remained precisely the same. He went home and told his wife that he had become general auditor for his company. The thing sounded so important that she scarcely waited to do up her breakfast dishes the next morning before setting out for the marts to buy a new set of furs. It seemed as if they both, from then on, were intent upon raising their scale of living to correspond with the dignity of his new title. And, naturally, they had much more financial difficulty than ever before.

Experience has furnished conclusive proof that, in the long run, men who steal large amounts of money—amounts far in excess of that needed for necessities—do so because of their desire to impress themselves favorably upon one or more members of the well-known fair sex. However, it is rather rare for a man to go wrong because of a woman unless he also drinks liquor. For some reason the wrong kind of woman is idealized in a man's sight after he has had a number of drinks. Her charms are augmented beyond their true perspective. He thinks she is worth risking almost anything for.

Another trouble about drinking is that one completely loses one's sense of proportion. It makes a man feel a great deal more essential than he actually is. An eighteen-dollar-a-week clerk, after a few rounds of drinks, has an idea that he can follow the pace set by a man drawing five thousand dollars a year. He thinks he has enough

money to do whatever he wishes to do. He regards himself as a giant, both physically and financially.

With the falling off in drinking, men are becoming more and more dependable and more honest. A surety man told me that he believes the time is not far ahead when dishonesty will become practically negligible—simply because of the nation-wide decrease in drinking.

Certain nationalities and certain occupations comprise better honesty risks than others. For instance, everything else being equal, an unnaturalized foreigner is less likely to be honest than a man native born; because he is far from home, is little known, and has comparatively little incentive to guard his reputation in the community.

An Englishman, living on his native soil, is an exceptionally good risk, for a number of reasons. In the first place, unless he goes to foreign shores, he cannot get very far away from home. His island is too small for any part of it readily to become a land of Whereabouts Unknown. He has just that much less chance to hide than an American with a whole vast continent full of distant places, many of them well off the main trudge. And, what is much more important, the Englishman has been accustomed all his life to living under laws more strict than ours, and to seeing justice work much more swiftly. He has come to regard dishonesty as scarcely worth the risk involved.

In the long run, a man living in a small, settled community is less likely to go wrong than a man in

a large city—particularly a city where there is lots of so-called night life. This is due partly to the fact that there are fewer temptations in a small place, and because the man in a little town knows nearly everybody. If he steals and is found out, each and every person he must pass on the street adds to his mortification. In a big city he could steal, perhaps, without even his next-door neighbor knowing it.

Surety companies long ago learned that their number of losses will vary noticeably according to the general educational average in different localities. With an equal number of risks, they will have more losses in a place where the average citizen is poorly educated, than in a place where the people are more enlightened. In a state where their ratio of loss is small, the surety company knows, without asking, that the educational standards are high.

Proportionate to the population, the honesty risk is greater in a newly settled community. All kinds of people are there, good, bad, and indifferent; they have less regard for one another's opinion than in the old established neighborhood; and there is less heed to law and order and old customs.

On the other hand, an old, established community may be a breeding place for dishonesty, just because of its conservatism. A few years ago a surety company had so many losses in a certain county of a Southern State that they decided to in-

vestigate conditions there. They found that the whole locality was so conservative that people seldom went away from home. Business houses and banks had poor methods of bookkeeping, some scarcely any at all. They were doing business without card indexes or modern system of checks and balances. It was easy for a person to steal and place the blame, or at least suspicion, on somebody else. Moreover, ethical standards were low. For instance, it was considered all right for a county treasurer to steal a little, so long as he didn't take too much. That sort of thing had been done so long that the people were accustomed to it. They simply excused it by saying: "Oh, that sort of thing has been going on for years." Politicians did various things which they knew were not right, but to which they had become too calloused to pay much attention. Boys and young men growing up in this atmosphere naturally decided that a moderate amount of dishonesty was permissible.

"If that place had better railroads and better highways," reported the investigator, "so that people could get away from home occasionally and catch a fresh viewpoint, most of the dishonesty and lax codes of ethics would disappear."

I repeat that the simplest way to make a man honest is to make it impracticable for him to be dishonest. Years ago there was a lot of trouble due to people whittling off little pieces of gold or silver coins and in that way collecting small quanti-

ties of valuable metal. It was impossible to catch anybody in the act, and the practice was a great nuisance. Then someone hit on the plan of milling the edges of coins and having a rule that when this milling was damaged the coin would not be passable. That stopped the trouble instantly. It no longer paid to do it.

The nature of a man's occupation is a help or a handicap, with regard to his honesty, according to the amount of supervision it carries with it. A man working in the branch office of a big company is probably more likely to go wrong than if he were in the main office, directly under observation of others in high authority.

Occasionally a traveling man will establish for himself a lax code of ethics that he would never have considered if employed in an office where he would be subject to daily tab on his behavior and well-systematized restrictions. A jewelry salesmen, for instance, with a large assortment of samples entrusted to his care, selling goods on commission, or a man who travels about collecting money for his firm, is at heart no less honest than anybody else; but his work means a certain amount of temptation —especially if he ever faces a real need for immediate cash.

Another reason why surety companies prefer to shy clear from this type of risk is because the nature of the work gives opportunity for disputes between employer and employee. The man selling goods on commission may think he has not

received all that is due him, and take his employer's money, insisting that it is really his.

A mere youth is not as good a risk as an older man, for the reason that his character is still unformed. He has no reputation back of him to indicate what his future behavior will be. On the other hand, a man who has been in a position of trust and responsibility for two or three years, with a perfect record, may have been there just long enough to have won everybody's confidence and thus make defalcation comparatively easy. A surety company would rather guarantee the honesty of a man who has an unblemished record covering at least ten years. The man who plods along on a safe and sane basis for ten years without any sign of skittishness is a pretty safe bet.

Some years ago an Italian psychologist declared that at a certain age—from thirty-eight to about forty-four, I think it was—men were more likely to be dishonest than at any other time. Surety company experts take little stock in this theory. About the only reason a man aged thirty-eight might be more likely to steal than one twenty-eight is because of greater responsibility and greater demands upon him.

A woman is more likely to be honest than a man, partly because a woman, generally speaking, is more moral than a man. Then, the man who becomes a bit flighty and wants more money than he needs usually desires the money to spend on some woman. This rarely works the other way.

However, women have a much greater desire for costly clothes and finery than men. Most shoplifters are women. All conditions being equal, though, if you are hiring a bookkeeper whom you do not know, it is safer to hire a woman than a man.

In trying to get a line on a man's past, in order to arrive at a conclusion about his future conduct, one is handicapped by the fact that people often dislike to speak ill of a man when it may prevent his obtaining work. You get a list of a man's former employers and other references and ask them if they know anything detrimental to his character. They hesitate about putting down on paper anything which will injure his future chances, and are quite likely to minimize his shortcomings.

On the other hand, it is surprising how often a man will give as references persons who cannot conscientiously say anything good about him. There seem to be two or three explanations of this —one, as suggested above, because the man takes a chance on people not wishing to speak ill of anyone. Another explanation, and the one which I believe most often applies, is this: A lot of men think so highly of themselves that it never occurs to them that anybody else could possibly fail to place a similar estimate on them.

Some years ago I had occasion to sublet a little flat I had been occupying. Naturally, I wished to have reasonable assurance that my tenant would

© *American Magazine*

Many men are honest in direct ratio to the danger of being caught

pay his rent and that he would not pass quietly out of sight some day before sun-up, taking, maybe, a van load of my furniture along with him. So I asked for references. One man breezily mentioned a list of prominent bankers, captains of industry, capitalists, high-born social lions, and foremost citizens, which made me heartily ashamed of my impertinence for even asking him such a question. But after he had gone, I called up a number of his references, and without exception all told me substantially that they would not trust him around the corner.

He doubtless thought that I would be so dazzled with his high-toned references that I would not bother to call them, or else he was under the impression, because these men had always treated him politely, that they held him in the highest esteem.

The safe plan, when an unknown man gives references, is to take nothing for granted, go and look the references in the eye if possible, and hear what they have to say.

CHAPTER XXI

HUMAN NATURE AT THE CREDIT WINDOW

It is astonishing how much an expert credit man knows about the average person after taking one quick look and asking only one or two seemingly casual questions.

A well-dressed young man walks up to the credit window and expresses a desire to open a charge account. He wishes to buy some clothes. The credit man has him fill out a little card, with space for his name, home address, occupation, place of business, and whether married or single.

After glancing at the man, and the card, the credit man knows the following facts:

The customer does not own his own home, is living somewhat beyond his means, is selfish, therefore not well-balanced—inclined to please himself at the expense of somebody else—and should not be trusted too far.

The man's place of residence is in an old street just off one of the city's main thoroughfares, and given over mostly to large, old-fashioned houses, except where these have been torn down to make way for apartment houses. It isn't likely that the man lives in that location except in a flat, in

which event he is, of course, a renter. And rents there are high, considerably higher than a billing clerk in a small wholesale concern should pay. The credit man knows about what the concern mentioned should pay a billing clerk—let us say thirty-five dollars a week. Not more than a fourth of that should go for rent. That leaves so much for groceries, so much for clothes, and so much for other smaller items.

A man's expenditure for clothes should not be quite half as much as his wife's. Women's clothes cost more. But this young man is dressed rather expensively. And he wants more clothes—wants them so much that he is willing to run in debt for them. The one who is doing without clothes must be his wife. If he were a salesman there might be some excuse for him to dress expensively—in order to carry a look of prosperity and help his sales, or to land himself a better job.

But costly clothes are of little help to a billing clerk. The reason for them must be the personal vanity and selfishness of the wearer. This theory is confirmed by the expression of the applicant's face.

All these things flash through the credit man's mind in a few seconds. He does not rely entirely, however, on such deductions. If in doubt he puts additional questions. But more often than not it is unnecessary to ask any questions at all. For if the applicant has ever had credit elsewhere, his whole record is already on file. Lists and black-

lists, from which one may learn of the paying or nonpaying propensities of thousands of men and women, are exchanged among the stores in any big town. That is the work of the Retail Credit Men's Association. If you are slow to pay your bills at one store, every other store at which you might seek credit is certain to know it.

Every day somebody goes into a big store where he is not known, asks for credit, gets it, and goes out marveling that the thing was so easy.

"For all they know," he thinks, "I might be a dead-beat or a crook. They must lose a lot of money in that way."

The truth is that credit losses in the average big stores are surprisingly small—comparatively trivial. When a store lets a stranger open a charge account, they know a great deal more about him than he suspects.

Credit men in big retail establishments, especially department stores, become very expert in sizing up feminine human nature, for the majority of the shoppers in such stores are women. A great many women are pretenders. That is, they pose as "grand ladies" when they are not. Rarely does such a woman, when she appears at the credit man's window, succeed in fooling anybody. The expert credit man knows that many well-to-do gentlewomen dress plainly, and that many pompous women of the plush-horse type nevertheless have financial standing; but he also knows that when a coarse-featured woman wears fake jewelry

and ultra-fashionable clothes, or other bizarre combinations of cheapness and expensiveness, she will bear the closest investigation. If she appears insulted when asked to answer a few customary questions, the credit man simply confirms his suspicion that her account is not desirable. Moreover, the credit man is dubious about a woman who is either unduly talkative, or needlessly uncommunicative. The woman who talks too much may be trying to hide something under her veil of palaver. And the one who will volunteer nothing at all is at least unfair to the store, for she should appreciate that they are entitled to know something about her before extending credit.

On the other hand, a woman may have little to say owing to a feeling of embarrassment, because she is not accustomed to business dealings. And she may suddenly talk with surprising freedom, due to a sense of relief, as soon as she feels that the worst of the ordeal of obtaining credit is over. A good credit man knows this, and schemes to place a woman at her ease as quickly as possible.

While a customer seeking to establish credit has no justification for being offended when asked about her financial status, yet the high-grade credit man knows that it is wise to get his information with the fewest possible number of questions.

The trick is to have a touchy customer supply answers to questions without knowing that she is doing so. For if a customer becomes offended

the store may lose not only her trade but the trade of any friends she is able to influence.

I once overheard a conversation between a credit man and a woman whose appearance—as the credit man later told me—indicated that she was high-strung and should be handled carefully.

"I would like to open a charge account here," was all the information that she volunteered.

"Very well," replied the credit man, breezily. "Just let me jot down your name." She said her name was Mrs. Ralph J. Ferguson.

"That's not the Ferguson down at the City Hall, is it?" inquired the credit man in friendly fashion, as if his only object were the fun of discovering a former acquaintance.

"Oh no," she replied; "my husband works for the gas company. He's been there for the last seven years."

"That's right. Isn't he in the accounting division?"

"No, he's assistant to the chief of installation."

The credit man nodded knowingly.

"Now, if you will give me your street address," he went on casually, reaching for a pen. "I'll put it down here on our books."

"We live on East Hampton Avenue," was the reply.

"East Hampton. That's a nice little street. A friend of mine nearly bought a house out there last spring. By the way, Mrs. Ferguson, what's property worth out there now?"

"Well, we paid eleven hundred dollars for our lot just before we built, but that was some time ago. When we reduced the mortgage recently the man told us the values there had advanced a good deal."

"I suppose you know my old friend George Ruddick, the grocer?"

"Yes. We usually deal, though, at Harner & Wolf's."

"That's a good store, too."

Now, it will be noted that, without any formality and without the customer's realizing that she has told anything about her financial standing the credit man has learned a number of facts: He knows where her husband is employed and the nature of his work—from which he can make a pretty accurate guess as to the amount of his salary; he knows that they live among genteel people and own their own home. Moreover, he knows where they buy groceries, and can easily find out from the grocer if they pay promptly. He can use the telephone and the city directory, and readily confirm the other things she has told him. He not only got the facts he wanted without offending her, but she is pleased and flattered over the nice chatty little human way the store has dealt with her.

Obviously no credit man would undertake to handle all customers in the same way. A great many would prefer more formality. In a majority of cases the customer fills out a little card, and that is all there is to it. And the credit man

in a big establishment does not always deal with all customers personally. Often his assistants are girls. Credit men are pretty well agreed that for some reason no class of girls can do this work so well as Irish girls.

Widows comprise a difficult problem for every retail credit department. You can't ask a widow what her husband's occupation or salary is. Maybe she lives in a boarding-place. She is unemployed, and has not established credit at other stores in the city. She may have independent means, or she may be an adventuress. Even if she has every intention of paying her bills, a woman's desire for clothes often destroys her sense of balance.

What is a credit man to do in the case of a widow? He can ask her for names of her acquaintances, who may serve as references. Or, if she has not been in the city long, he can ask where she dealt in the city where she lived before. In fact, if he can learn where she came from, all he has to do is to get in touch with the retail credit association there. If she had credit at stores in that city and paid her bills promptly—or didn't pay them—her record is on file. But if the woman should be an adventuress she may have changed her name. It is not unusual, by the way, for a woman to go from one town to another and use the name of a prominent society woman. Let us say that a woman goes into a store in Cleveland, explains that she is visiting in the city, gives her

hotel address, and her name as Mrs. Cecil J. Vanderhick, of Pittsburgh. The Vanderhicks are leaders in Pittsburgh, and there is no question about their ability to pay for whatever they buy. But there may be some question about the woman in the store being Mrs. Vanderhick. So the credit department wires the retail credit association in Pittsburgh, asking for a brief description of Mrs. Cecil J. Vanderhick, and whether she is visiting in Cleveland. A big store must constantly be on guard against the buyer who tries to represent herself as somebody else, even in the same city.

It is probably true that most stores have more credit losses on widows than on any other one class of persons. An almost equally serious problem in the average big store are those planning to become widows—that is, grass widows. A woman about to be sued for divorce will often make a dash for the nearest department store to stock up with everything she thinks she needs, and charge it all to her husband ere it is too late. And there is no way of knowing in advance that a woman is about to take part in a divorce action; a store is simply obliged to take chances.

"Beware of the woman," remarked one credit man, "who doesn't seem to want you to call up her husband."

And nothing excites suspicion in a store more readily than for a customer, immediately after being permitted to open a charge account, to buy

heavily—especially if the articles bought may be classed as luxuries.

"Mrs. So-and-so has ordered these articles sent to her home," a clerk reports. "Shall we let her have them?"

Let us assume that the customer has only recently obtained the credit privilege. The credit man can look over the list and pretty nearly tell at a glance, just from the kind of things ordered, whether the customer intends to pay for them or not.

Competition makes credit a necessary evil. Nearly any high-grade merchant will tell you that the modern system of retail credit is not economically sound. A man goes into a department store to buy an overcoat. He expects to pay about twenty-five dollars—all he can afford. The clerk shows him a coat at forty dollars which strikes his fancy, and he thinks: "Oh, well, I don't have to pay for it just yet, anyhow." So he buys the forty-dollar coat, even though it is beyond his means. If he had been obliged to take the money from his pocket in actual cash, twenty-five dollars would have been his limit. Having bought his coat, the man decides that he wants a pair of shoes. There is a place down the street where he can get them seventy-five cents cheaper, but he stays right where he is, because at the other place he will have to pay cash. Thus credit discourages buying at the most advantageous market.

One credit man I know has really done a great

© *American Magazine*

"I wouldn't burden myself with paying installments on so much stuff. This may not be any of my business, but you'll thank me for it some day." And they did

work in encouraging people to live within their means. A young bridegroom came in one day with his bride to buy furniture for the little four-room nest in which they were to begin housekeeping. The man had only a modest income but he felt that his wife was so lovely and attractive that she should have the best of everything. So he ordered about twice as much furniture as he could afford. The credit man looked over the list of things they had selected, and then spoke to them somewhat like this:

"We're here, of course, to sell furniture, but, honestly, if I were you, I wouldn't burden myself with paying installments on so much stuff. Instead of buying a one hundred-and-fifty-dollar dining-room set I would get one for about sixty dollars, even if I had to replace it later on. As a matter of fact, you don't need any buffet for your dining-room. Lots of flats have them built in. Get a little serving table and make it do. And what do you want with a lot of stuff for a spare room? If some of your relatives come to visit, let 'em sleep on a cot. They will think all the more of you when they see you're starting out modestly. This may not be any of my business, but you'll thank me for it some day."

And they did.

Everything else being equal, credit men say, the best risk is a man earning around $2000 a year. If he makes much less than that he may have difficulty in making ends meet. But a $2000

a year man can live comfortably, and yet be free from the temptations that beset a man earning $5000. When you're making $5000 a year you move in a circle which will probably include persons earning $10,000 or more. And you may try to keep up with them. The only way you can follow their pace is to live beyond your means. The same thing is true of the man earning $20,000. After you once get into the comparatively wealthy class you are constantly up against the temptation to live like the fellow who makes a little more than you do.

I once asked three different credit men what occupations seemed to be most closely associated with the prompt payment of bills. It is interesting to note that all three men gave me the same answer. Each one said that, all other things being equal, he would rather trust a railroad man than a person of almost any other occupation. The reason is that a railroad man is trained to be systematic and punctual.

Another credit man told me that for the amount of their income, lawyers and doctors—more particularly lawyers—are notoriously slow about settling bills. A lawyer hasn't the fear others have of being forced to defend an action in court. And, then, any professional man gets his income spasmodically, irregularly. It is not so easy for him to fall into regular habits in his expenditures as the man who gets a certain amount of money every Saturday night.

People of vast wealth are often the most difficult to get money from. They are aware that the store proprietor knows they are good for whatever they owe. And as their income is from capitalistic rather than from salary sources they fall into the habit of keeping every dollar of their principal working in their own interest as long as possible.

Big-store proprietors and credit men know that the summer vacation season is the most difficult time to collect bills. Men are saving their money for other purposes and are slow to give it up for something already consumed. The first of January is the easiest time for collections of all kinds, even though it follows close on Christmas, simply because everybody has firmly imbedded in his mind the idea that one should start the New Year with a clean slate—and that he will only be doing what most other people are doing and are expected to do. When a man doesn't pay a bill around the early part of January, there is no telling when he will pay it. If he is allowed to go until, say, the end of February, he is all over his New Year resolution to get squared up, and will be twice as difficult to dissociate from his money as he would have been even two or three weeks sooner.

CHAPTER XXII

THE VOICE OF THE AVERAGE MAN

It would be interesting to know what percentage of business men fall short of success because of some disagreeable quality of voice. Most American voices are strident and harsh. Men come in to sell us things, or to talk to us about business propositions of one kind or another, and their talk, not infrequently, annoys us—not because of any lack of merit in what they say but because of the irritating way in which they say it.

Persons who have given the matter much thought declare that the standard of speech among Americans is the worst in the civilized world—slovenly in comparison with English, French, German, Italian, Spanish, Russians, or even South American. Anyone who has studied French or German, under a native instructor, will recall the great stress laid upon accurate pronunciation and distinctness by such teachers. Here in the United States, on the other hand, it is so common to hear men say, "cer'nly" for "certainly," "goin'" for "going,"—even "gunna" for "going to"—and a long list of similar inaccu-

racies, that such utterance is accepted as a matter of course.

Possibly an appreciable amount of business inefficiency may be directly due to the single item of not understanding the names of persons to whom we are introduced. There is no question about the business advantage of remembering names. And one great reason why we often fail to remember a man's name is because we did not catch the name in the first place.

In connection with his efforts to arouse interest among business men, in better speech, a famous voice expert talked to a number of traveling salesmen who, he discovered, were holding rather mediocre positions, for no other reason than that they lacked something in agreeable personality. He met one man, selling a line of high-grade goods, for which the man had some wonderful sales-arguments. Yet the arguments were not as impressive as they should have been, simply because they were not clean cut. The man slurred his words, said "cer'nly" for "certainly" and "mou'n" for "mountain." After he came to know the salesman well enough, the expert called his attention to these defects, and the man tried to correct them, but had some little difficulty. The instructor noted that the trouble was due entirely to the fact that he did not make proper use of the tip of his tongue. This was readily corrected by the use of some simple exercises. To-day that man's income has considerably increased,

and there is little doubt that the reason is mainly his improved personality. He is able to sell more goods because people are more willing to listen to him; he is more pleasing in conversation.

There was another man who was obliged to do so much talking that at the end of a day he was physically tired from his vocal efforts. And the reason was that he talked in what might be termed a wasteful manner; that is, he did not convert all his breath into tone. He was like the fireplace where most of the heat goes up the chimney. Still another man talked poorly because his vocal chords were too tight and needed a little special exercising and the repetition of certain sounds to loosen them up. A noteworthy feature of a number of cases that came by chance under the expert's observation was that many business men were laboring under vocal handicaps which could be remedied in just a few days.

One salesman had a habit of talking too rapidly. While he spoke with reasonable distinctness, and his tonal quality was good, he fell short of his full efficiency because he failed to convey an impression of calmness. There is something about the salesman who is quiet and calm and sure of himself that tends to increase one's faith in the stuff he is selling.

Then there is the type of man who talks too loudly. He may have a musical quality in his voice, and excellent pronunciation, but if his voice keeps booming in one's ears more loudly than is

necessary, the man gradually wears on one's nerves.

Business men over the country are beginning to realize the importance of less vicious speech habits as an aid to national efficiency. One telephone company executive once remarked:

"We would be willing to spend thousands of dollars if we could have any assurance that it would have any noticeable effect on making people speak more plainly."

And what is true of telephone companies is true, to a surprising degree, of various other lines of business. There would be a vastly greater business efficiency if it were not for the widespread defects in American speech.

If you were to go into the operating room of a big telephone exchange, where hundreds of girls are busily repeating numbers and jabbing plugs into switchboards, you might be impressed with the fact that all the operators are using about the same tone of voice. The tone seems to be something like an E flat, and it is so low that one can scarcely understand what any girl is saying, even though standing only a few feet away. But the subscriber at the other end of the wire has no difficulty in understanding.

The operators have unconsciously fallen into the way of using a tone to make themselves understood with the minimum of physical effort. And they have had special training to make their enunciation effective. It is a rare thing for a

subscriber to have any difficulty in understanding a telephone operator. Yet when a mistake is made, the tendency is to blame the girl at the switchboard—to blame her for not being able to understand the faulty enunciation of the subscriber

If the average telephone subscriber spoke as distinctly as the average operator, there would not only be much less annoyance, and less wear and tear on the temper, incident to telephoning, but the telephone companies could give more service for less money. For one thing, if there were no mistakes to be corrected, not nearly so many operators would be needed.

Faulty though it is, our talk is much more plain over the telephone than at any other time. For we have learned that it is advantageous and time-saving to take special care of our pronunciation over the wire. A few years ago retail establishments which took orders over the telephone had a vast amount of trouble and expense correcting and remedying errors due to misunderstanding what customers said. A great deal of this has been eliminated. The best grocery concern in Cleveland, Ohio, has a big store in the residential section at which a trifle more than eighty per cent. of its business is done by telephone. This enables the company to get along with much less floor space and fewer clerks than if all these customers came to the store each day and gave their orders over the counter. And a surprising feature is that

there are actually fewer mistakes and misunderstandings over the telephone than when the customers deal with the various clerks face to face. It simplifies things to take an entire order at one place.

A small amount of thought on the part of telephone users would eliminate much of the tendency to be misunderstood. The reason a telephone operator is usually more easily understood than a subscriber, is because the operator is required to give attention to her pronunciation. For example, consider the words "five" and "nine," which frequently sound alike over the telephone. If you give undue emphasis to the "i" in those two words, and neglect to emphasize the more distinguishing sounds, there is great danger of confusion. An operator is taught to say "five" not only with a long "i" but also with a strong "v," and to place special stress on the second "n" in "nine," almost as if it were spelled "nien." The words "three" and "four" might sound alike if one were to place emphasis only on the "r." But when you say "three" with a slightly rolling "r" and a good broad "e," and say "four" with stress on the long "o," there is little chance of misunderstanding. Telephone operators are taught also to speak with a rising inflection. In saying the word "number," their tone goes running up on the final syllable. This is not only because it sounds more cheerful to speak with a rising inflection, but because, for some reason, one is more easily under-

stood than when the voice drops at the end of a word. In England nearly everybody speaks with a rising inflection. A clerk says "Thenk you" and about all you hear of it is something that resembles "Q," but his remark has nevertheless a cheery sound. Here in America we say the same thing with a falling inflection and it sounds rather perfunctory, at times almost surly. To make a remark with rising inflection is almost like adding, "Don't you think so?"—but there is something of finality about the falling inflection which makes one's talk seem dogmatic. Taking us on the whole we are a nation of dogmatic talkers.

Some of the schemes made use of by telephone companies to improve the pronunciation of their operators would readily lend themselves to other lines of business. For instance, it is a rare thing for street-car and subway conductors to call out the names of streets in a way that can be understood by passengers. There has been a decided improvement, however, on the part of most steam railroad-brakemen. Several times in recent years I have heard brakemen mention the name of the next station in a careful, well enunciated manner which actually conveyed a meaning. The steam railroads have recognized the advantage of giving heed to such matters. On the other hand, I recall hearing a subway conductor call out "Barclay," his intention being to let passengers know that the next stop would be Barclay Street. He might as well have yelled "rock," or "rah rah," or

"bow wow," and his meaning would have been equally clear. Yet if he had been taught to pronounce it, slightly exaggerated, like "Bar-r—clee," with a merry, rising inflection on the last syllable, passengers would not only have understood him, but would have received a subtle impression that it gave him great pleasure to call out the stations.

An encouraging fact is that the average American's bad speech-ways, and noisy, harsh voice are merely the result of careless habits acquired in childhood.

A general insistence on decent speech—distinct utterance, and clear, quiet voice—would not only make life pleasanter but would enable us to talk faster and be understood more easily in all our business dealings.

PREFACE

This book has resulted from the coöperative attempt, on the part of a group of practical business men and one or two individuals whose interests were chiefly scientific, (a) to formulate and systematize those facts and laws which relate to the processes of appeal and response in the selling and advertising of goods, and (b) to undertake investigations which might result in the discovery of new facts and principles of both practical and scientific interest. This attempt has proceeded on the basis of four distinct aims, which it is well to have clearly in mind. These aims have been:

(1) To sort out, from the general body of psychological doctrine, such principles as underlie the mental processes involved in creating, presenting and reacting to appeals which are presented in the form of advertisements, arguments, selling talks, etc.; to state these in systematic form for convenient acquisition and reference by the active and prospective business man.

(2) To examine such various methods, media and devices as have proven clearly successful or

unsuccessful in known circumstances, places, and with different commodities, and to deduce and formulate any principles revealed by such comparative study.

(3) To carry on, in a coöperative way, new experiments and investigations, by exact scientific methods, and with the definite intention of helping to render the technique of the laboratory more and more serviceable in handling the practical problems of daily business life.

(4) To devise accurate and reliable methods of testing beforehand the probable value of appeals which are intended for actual use in advertising and selling, (a) by more exact study of the known principles of appeal and response and their applications in business transactions, and (b) by a comparison of laboratory tests with keyed results produced by the appeals in business campaigns.

The results of this coöperative attempt are presented in the chapters which follow. The first line of work will constitute the skeleton of the book, and the results of the other inquiries will be introduced by way of illustration and proof of the principles presented.

The book is intended primarily for the general reader and for the student with practical rather than theoretical interests. It does not pretend to present nor even to conform to any particular

"system" of academic psychology, but aspires to render more concretely serviceable, within a particular field, the accepted facts, laws and methods resulting from the experimental study of human nature and human behavior. But it is hoped that the professional student of human nature may also find the motive and method of the book to be at least suggestive, and in that sense valuable.

In its original form the book consisted of a series of lectures given, during several successive years, under the auspices of the Advertising Men's League of New York City. This fact determined the practical bearing of the material presented. It is quite impossible to give due credit to all whose work has been of service to the writer in this undertaking. From the practical point of view the suggestions and criticisms of the members and chairmen of the League Round Tables have been invaluable. On the scientific side, an attempt is made in the bibliography to indicate the chief sources which have been specifically utilized. But I must render particular thanks to the many members of my college classes whose zeal and labor have made many of the experiments possible. I am under especial obligation to Dr. E. K. Strong, Jr., at one time assistant in the Barnard laboratory, and since Research Fellow, in Columbia University, for the

Advertising Men's League and the National Association of Advertising Managers, for his constant interest and assistance, and for a great amount of data, more specifically referred to in the text.

But, above all, the very existence of the book, the opportunity of preparing it, and very much of such concreteness and value as the book may contain are due to the untiring activity and the stimulating professional ideals of Mr. Wm. H. Ingersoll, President of the Advertising Men's League. It was under his leadership that the Round Table Study Course was conceived and effectually organized, and through his suggestions and advice that the course on Principles of Appeal and Response was originally planned.

HARRY L. HOLLINGWORTH.

Columbia University,
New York.

PRINCIPLES OF APPEAL AND RESPONSE

CHAPTER I

MEASURING THE STRENGTH OF AN APPEAL

One of the first tasks of any science is that of devising methods of measurement. There could be no science of physics without the possibility of measuring forces, velocities, magnitudes, temperatures, etc. Experimental psychology arose only when men began to succeed in measuring the intensity, speed, uniformity and difference of mental and motor processes. In so far as salesmanship is to be scientific it must also evolve methods of measuring its materials.

Now the first step in any business transaction is the presentation of what we may call, for the sake of convenience and simplicity, an *appeal.* This appeal may take the form of an advertisement, an informal selling talk, or a more direct proposition such as a form or personal letter or circular, or it may consist merely in the knowl-

edge, on the part of the customer, that a given commodity possesses certain desirable qualities, will accomplish certain results, etc. It will be seen at once that all salesmen are not equally persuasive, all advertisements are not equally effective, nor are all qualities or results equally valuable. A question of prime importance, then, is: "How is it possible to determine the strength, the 'pulling power' of an appeal?" If such measurement is possible, this will be the first step in the application of scientific method to this field.

It is, of course, obvious that the relative strength of appeals may be measured by the determination of the actual results: the number of inquiries, the amount of sales, the cost per sale, the demand for the articles, etc. Attempts to make these measurements have always been made. The sales of each salesman have been checked up with those of others, advertisements have been keyed, by means of different addresses, street or box numbers, differently numbered catalogues, etc. The effects of changes in location, new methods of display, etc., have been judged by the subsequent changes in output. But two difficulties in the use of these methods are apparent at once.

In the first place it is exceedingly difficult to trace, with any precision, the actual effect of an appeal already presented. Innumerable disturbing factors complicate the calculation: the season, the medium, the activities of competitors and imitators, the method of sale (whether retail, wholesale, mail order, etc.), the effects of other means of publicity which may be operating at the same time, changes in styles, wants, and general prosperity on the part of consumers. Conditions are not under control and even inferior methods may occasionally be more remunerative, for the time being, than a more cautious attempt to secure the uniform conditions of trade, circulation, competition, etc., which would be required for a careful experimental measurement.

The second difficulty is that such methods are costly. All the measurements take place *after* the appeal has been presented, and expenses must be met regardless of the success or failure of the appeal. Coöperation might afford relief at this point were it not for two facts. The results of one campaign involving one commodity, one clientele, one set of executive and distributive operations, cannot be carried over bodily to another business venture in which all or several of these factors are changed. Further, business is com-

petitive, and successful methods are not proclaimed and communicated to all comers.

We must devise, then, not only a method of measurement, but a method which will permit of measurement *beforehand,* and which will be so flexible as to permit adaptation to widely variant circumstances. And since we are dealing with such subjective things as interest, feelings, persuasions, attention, choice, motive, action, belief, we cannot employ any objective scale such as the yard stick, the balance, the clock work, or thermometer. But we need not despair. In the psychological laboratory we find students measuring the intensity of sensations, the degree of attention, the strength of belief, the legibility of handwriting, the agreeableness of color combinations, the excellence of literary compositions, the eminence of scientific men, the humor of comic situations, and many other things which are no less subjective than the persuasiveness of a selling talk or the pulling power of an advertisement. It was in such a laboratory that the first successful attempt was made to measure beforehand the relative strength of such appeals as are commonly employed in business. In the following portions of this chapter descriptions will be given of some of these measurements, which were made

in my own laboratory, either by myself or by my students and fellow workers. In later chapters the various methods employed will be presented, and I shall further show how the application of such laboratory methods enables us not only to measure the strength of the appeal as a whole, but also to analyze it into its various elements. By means of such analysis we can determine the nature of these elements, the ways in which people of various ages and classes react to them, the deeper-lying reasons for these reactions, and can present in concrete detail the processes going on in the mind of the customer engaged in a business transaction.

In the following accounts the general plan will be:

1. To secure measurements, by laboratory methods, of the probable relative values of various appeals. In doing this we must arrange for controlled conditions by restricting the appeals to the same commodity or type of article, and by keeping uniform, for the time being, such items as size, legibility, familiarity, etc. These factors will later be discussed, each in its proper place.

2. Having measured the appeals in the laboratory, we shall secure the actual returns or re-

sults which the appeals produced. Partly for this reason printed advertisements are chosen as material rather than letters, personal interviews, or the commodities themselves. The results will, however, apply as well to the various sorts of appeal already enumerated in so far as they have elements in common with the advertisement.

3. We shall then compare the laboratory measurements with the actual returns provided by the business concerns using the advertisements, in order to see in how far the actual results after circulation agree with the laboratory results which could have been determined beforehand. In no case were the actual results revealed until the laboratory measurements had been already made and announced.

MACHINERY ADVERTISEMENTS

The first series studied was a set of machinery advertisements shown in the illustrations on pp. 6 and 7. There are five appeals, of uniform size, each constituting an attempt to influence buyers or inquirers in favor of the same commodity. The following table shows the results of the laboratory test, the ten persons experimented on being seniors in an engineering school, thus represent-

ing the general class of people to whom such appeals would be directed in the natural course of business. If a given appeal was found to be the strongest for a given individual, it was marked 1 for him. If it was found to be the least persuasive, it was marked 5, and the intermediate positions indicate corresponding places in the order of strength. In the final column of the table is given the actual order of merit of these five advertisements, determined by the number of inquiries which followed upon each when run in the same medium. It is not necessary at this point to discuss two factors which will at once occur to the mind of every business man: the "cumulative effect" of successive appeals, and the "law of diminishing returns" which may operate when a series of appeals is presented to the same body of readers. These factors will be treated in their

TABLE I

Appeal	Ten different persons tested										Average	Order of Superiority by test	Order of Superiority by actual returns
A	4	3	2	3	2	3	4	4	4	1	3.0	4	4
B	5	5	1	4	5	1	1	1	1	2	2.6	2	2
C	1	1	3	1	4	2	2	2	3	4	2.3	1	1
D	2	4	5	5	3	5	5	5	5	5	4.4	5	5
E	3	2	4	2	1	4	3	3	2	3	2.7	3	3

proper places. They do not influence the significance of the returns in the case now under consideration.

If now the relative values of these appeals, as judged by actual inquiries produced, be compared with the order as determined by laboratory tests, it will be seen that the two orders agree perfectly. The tests showed C to be the strongest and D to be the weakest, and, as a matter of fact, C pulled forty times as many inquiries as did D, in spite of the fact that the cost of running and preparing D was six times as great as for C. The other appeals range between these two extremes. The testing of this series in the laboratory before their appearance would have resulted in the elimination of the weaker appeals, and consequently in increase of returns and diminution in the cost of publicity. The reasons for the striking differences in the strength of these five appeals will be made clear in subsequent chapters. Analysis leads to the discovery of differences and of principles which are true not only for the appeals in this series but for appeals in general. The point to be made now is that the laboratory test is a genuine and reliable measure of the pulling power of the different advertisements.

SOAP ADVERTISEMENTS

A second case of close agreement is shown in Table II. The series of appeals consisted of eight advertisements. Two laboratory tests were made, one on 25 people, and the other on a different group of 100 people. The advertisements are shown on pp. 12 and 13. The first column in the table gives the letters used to identify the advertisements. The second column shows the relative persuasiveness of the appeals as determined by the first experiment, the third column as determined by the second experiment. These two tests

peals, as judged by the manufacturing company concerned, on the basis of twenty years' experience. The final column gives the order as judged by three experts of the advertising agency which had charge of this firm's publicity campaigns. Each of these various orders was determined independently, and without knowledge of the results of the other orders. The agreement is almost as striking as it was in the case of the machinery appeals. A change in the grading of just one advertisement in each of the last three columns will make all four columns agree. It is apparent that a preliminary laboratory measurement affords real knowledge of the strength of such appeals.

ELECTRIC LIGHT ADVERTISEMENTS

A third example must suffice by way of merely illustrating the reliability of the laboratory measurement. Table III shows five electric light advertisements as measured first by laboratory test and second by the cost per inquiry produced. Appeals A and B are the best two by both measurements. On appeals C and D the two measurements agree within one place in the series. Only on E is there any considerable discrepancy.

TABLE III

Appeal	Order as measured by cost per inquiry	Order as measured by laboratory test
A	1	2
B	2	1
C	3	4
D	4	5
E	5	3

Many significant things are revealed in these experiments which enable us to formulate general laws as well as to test the value of the specific appeals. By way of illustration, it must suffice for the present to call attention to appeal B in the first experiment, that with the machinery advertisements. Notice that in Table I, where the measurements of each of the ten people are recorded, B stands either at the top or at the bottom of the series of five appeals—never in the middle. Except for two people this appeal stands either first or last, and these two exceptions are not real differences, for even here the positions are 2 and 4. This means that there are two types of people in the group studied. For one type appeal B is very effective, and these are, be it noted, the very people for whom appeal D is very weak. For the other group, for whom appeal B is weak, D is fairly strong. Each of these appeals B and

D, then, influences only one-half of the group of people. To secure a more universal appeal it would be necessary either to run both advertisements, thus doubling the cost of returns, or to construct a third type of appeal which should combine the virtues of B and D. Appeal C is as close an approximation to this ideal appeal as the series affords. Note that it stands fairly high for both types of people. Only in two cases does it stand below the middle of the series. These differences are not accidental nor peculiar to this series of appeals. They are found in many series and with every group of people I have had occasion to study. Explanation of these facts will be given in due time.

CHAPTER II

THE NERVOUS BASIS OF MENTAL PROCESSES

Every mental process, even that of being impressed or repelled by an advertisement or a salesman, has a nervous basis. We have many proofs of this dependence of consciousness upon the nervous system. Thus injuries to the nervous system affect our consciousness, as do drugs which act temporarily upon the nerve tissue. Many forms of mental disease are caused by destructive processes in the nervous system. Experimental physiology finds that certain areas in the brain are control centers for certain sets of movements and of higher sensory and mental processes such as seeing, hearing, understanding the meaning of words, associating ideas, etc. All of our knowledge depends on the possession of sense organs—eye, ear, etc., and these sense organs are only special modifications of parts of the nervous system. Finally, comparative anatomy shows us that in the animal series, from lowest to highest forms, increase in the complexity

of consciousness is always accompanied by increased complexity of the nervous system.

Consequently, any study of mental processes should take account, also, of the underlying nervous processes. Such an account not only aids greatly in the explanation of the mental processes, but also serves as a scheme or diagram which is useful in systematizing and remembering the mental processes themselves, their laws, and their relations to each other.

Considered from this point of view a man is simply a nervous mechanism, which is capable, on the one hand, of being sensitive to objects and events in the outside world, and, on the other hand, of responding to these impressions by the various sorts of movements which make up his reactions, his behavior. Sensation on the one hand and movement on the other, sum up his life. When the sense impression is very simple—a sound, or a flash of light—we call it a *stimulus;* when it is more complex—an invitation, a problem, a strange object, an argument or an advertisement—we call it an *appeal.* When the reaction is very simple we call it a *movement;* when it is more complicated, and perhaps involves many movements, we call it a *response.*

All mental life, then, can be analyzed into the

two simple elements of *appeal* and *response*. A motorman suddenly sees a danger signal and stops his car. The red light is the appeal, and his movement in applying the brakes is the response. We try to teach a child to talk. The object we point to is the appeal, his speech movements are his response. Even the little politenesses and civilities of social life, the conventionalities of the street, the seashore, the banquet table, are solely a matter of this or that response to this or that situation. What distinguishes the insane man from the rest of us is the fact that he responds wrongly or irregularly to the stimuli and appeals of the world in which he is placed.

In salesmanship the situation is quite the same. Given a certain salesman, a certain article, a certain set of advantages or arguments, this constitutes the *appeal*. The important factor remaining is the way in which the customer will *respond* to the given appeal. The operation of an advertisement, be it good or bad, is precisely the same process. The appeal here usually comes through the sense of sight; it consists, let us suppose, of a poster of definite size, position, color and composition, and it advances certain selling points for the article it desires to announce. Here is the sensory side, the stimulus. Now how does the

passerby react to the appeal? It may "catch his eye," he may read it through, and, either now or on a later occasion, buy the article. Or he may behave quite differently. The appeal may never come into his consciousness, in which case the poster is passed unnoticed. Or he may observe it, remark, "What a glaring, unsightly blotch of color!" and pass by on the other side. No matter which of these things he does, it constitutes his response—a response made up of movement and general behavior.

A pertinent question now is: What is the nervous mechanism of such a process; what happens in the nervous system when a man responds to a stimulus? Here, then, we must get some knowledge of the nervous elements, and some insight into the way in which these elements combine to form the complex nervous system.

The simplest nervous mechanism that can underlie a process of appeal and response is a combination of two nerve cells. These cells are minute structures with a main body and two sets of branches. The cells are situated for the most part in the brain and in or alongside the spinal cord. There are, in the main, two kinds of nerve cells, sensory cells and motor cells. The sensory cell sends one long branch out to the surface of

the body to some sense organ, as the eye, ear, finger tips, etc. The other branches of this cell are short, and run chiefly toward motor cells which lie at a greater or less distance from it in the brain or cord. These short branches are met by the short processes coming from the motor cell, which in turn sends its long fiber out to a muscle, in some more or less remote part of the body.

This arrangement constitutes what is known as a "reflex arc," because nervous impulses pass along it much as do electrical currents along a circuit. Nervous energy set up by the outside stimulus passes along the sensory fiber to the center, where it is transmitted to the motor cell and passed on out to the muscle, reinforced, perhaps, by energy from other cells that are acting at the same time. The result is a movement of the muscle. The response is caused directly, we may even say mechanically, by the energy generated by the stimulus. So the nervous element falls into two sections, a *sensory end which is the basis of appeal,* and *a motor end which is the basis of response.*

These pure reflexes are not usually accompanied by consciousness. The impulse simply passes into the spinal cord and out. Examples

of such reflexes are blinking the eye when struck at, sneezing, coughing, the heart beat, etc.

But this simple arc represents the lowest level of nervous activity, that controlled by spinal centers. In the human being we may point out two higher and more complicated levels, which involve in the one case the higher brain, or cerebrum, and in the other the lower brain area, the cerebellum, medulla, etc.

Thus some appeals do not lead to an immediate and reflex response, but require deliberation, comparison and choice. These higher thought processes, processes of reasoning, argument, and decision, depend on the activity of nervous centers in the cerebrum. The sensory impulse, instead of issuing from the cord at once, in the form of a motor impulse, passes over a more devious path. It runs up along the cord to the higher brain centers and sets up activity through processes which, on the side of consciousness, appear as memories, associations, trains of thought, judgments. Only after these processes have been brought to bear on the appeal, when the past experience, conscious knowledge, interests, purposes, and ideals have determined what sort of response should most profitably follow—only then does the reaction come. What the response will be, or when it will

come, can not be predicted from the outside, as was the case with the simple reflexes. The response may be delayed, its character is uncertain, and it may be quite out of proportion to the physical strength of the stimulus.

A Long Circuit Appeal

Such a process of appeal and response operates, we may say, by means of *the higher level.* It involves what we may call in the psychology of advertising and salesmanship *the long circuit.* It

is apparent at once that it corresponds to a well-known type of selling talk, the *reason why* copy which invites and presents careful comparisons and weighing of advantages and disadvantages, copy which consists of the candid exposition of *selling points.*

But there are objects in our experience which, although they do not provoke an immediate reflex response, are, nevertheless, reacted to much more quickly, uniformly, and strongly than those which operate over the *long circuit.* Thus, in looking over a book catalogue there are certain titles which immediately catch my attention and lead me to examine them closely. Other titles I may seem not to see. If I am out walking on a fine afternoon and see a baseball game in progress in a nearby field, I find myself stopping to watch it, quite as a matter of course and with no preliminary deliberation. If I am passing through a lonesome part of the city on a dark night and see a stealthy form slink behind a tree ahead of me, I *instinctively* reach toward my hip pocket or tighten my grip on my walking stick. So when the mother sees an advertisement that offers an article guaranteed to promote baby's comfort, or when an ambitious man sees a device described that will certainly economize his time or other-

wise increase his efficiency, he finds that, quite in an unpremeditated way, he has left off doing other things and is reading through the announcement or description. All of these responses, while perhaps not immediate, are, nevertheless, quick; they are strong, and we can be reasonably

A Short Circuit Appeal

certain in advance what their character will be. We will find that in such cases the object has appealed to some universal *instinct, interest* or *de-*

sire, or has awakened some strong *feeling.* Such appeals call into action centers which are prompt, powerful and definite in their response. Such a process, then, involves what we may call the *short circuit.* Such an appeal obviously, in turn, corresponds to a distinct kind of argument, the *display advertisement* or the emotional selling talk which does not argue but simply attempts to work on strong feeling, instinct or ideal. The range of such special appeals is exceedingly wide, for there are many objects in our experience toward which we all react by this *feeling* circuit, without stopping to ask why we so respond. Our reaction is determined beforehand, for the most part by the history of the race in dealing with these objects.

Generally speaking, it is true that the long circuit is determined chiefly by the past experience of the individual, the short circuit by the history of the race. All of us behave in both ways. The particular way in which we respond on a given occasion will depend on the character of the appeal, the commodity concerned, the type of the person, his age, sex, present activity, and a great number of other individual differences which it is the business of psychology to study, classify and explain.

The practical value of a study of human nature comes to depend on the fact that there are some *universals,* some ways in which all people are alike. When no such universal traits are found, there will be either types or classes, the members of which resemble each other, or the members of the race will be distributed according to a more or less bilaterally symmetrical curve, with the greatest number of individuals arranged about the average or central type, while others depart from this type both above and below, the number of people for a given character becoming less the further that character is from the type.

Here, then, is a concrete problem in salesmanship and advertising. For what sort of commodities and with what sort of people is the direct short circuit appeal effective; what objects and classes of objects can be effectively advertised and sold by an appeal to special feelings or instincts? And for what objects will the long circuit be employed, the *reason why* argument, most effectively? Some answer to these questions we may hope to get as we continue, answers based partly on our general psychological knowledge, partly on the concrete experience of practical men and partly on definite experiments now being performed in the laboratories.

CHAPTER III

ANALYSIS OF TASK AND MEDIA

THE TASK

We may analyze the task of an argument or an advertisement in terms of the reflex arc, for their operation is the same as the operation of any other stimulus. The process is always:

1. Stimulus catches attention, comes to notice, separates itself from other impressions.
2. The impression either (a) at once drops out of consciousness, or (b) holds the attention, i.e., becomes dominant in consciousness and causes adjustment of the perceiving organ for closer examination.
3. In so doing it arouses central associations, memories, interests, feelings, and becomes firmly attached to these; the impression is fixed, and remains as idea or image.
4. It leads to motor response. This response

is an essential factor in determining the final meaning of the appeal. Psychologically as well as commercially, the response is one of the most important elements in the whole process.

Always bear in mind that a sensory impression or revived image has its inevitable motor issue. This will be an important principle later on. We shall only mention it now. And remember that this response does much to determine the *character of the perception.* Observe this process when a fly lights on the baby's cheek, or when we run a sliver in our finger:

1. We say: "Oh! what's that? Oh! it's a sliver."
2. We carefully observe the sliver, locate it, observe its length, depth, etc.
3. By the *short circuit* we respond at once by instinctive movements, sucking, grimacing, pressing, etc.
4. By the *long circuit* we compare, remember, reflect, and either secure a jackknife or go to a doctor.
5. We remember the event and act more quickly next time by virtue of this mem-

ory and response. The object is characterized by the response.

An advertisement must go through the same process:

1. I see Ingersoll's watch advertisement with the many hands. I say: "Hello, what's that?"
2. I examine it, read it through with care.
3. But now comes the apparent difference between the advertisement and the ordinary stimulus. With the ordinary stimulus the response, we may think, is immediate. But it is not always. With lower forms of life this is true. But the chief difference between man and lower forms is in the retarded reaction. Even the response to a pin prick may be delayed and complicated. Such delay usually characterizes the response to an advertisement, and this constitutes one of the two chief psychological differences between *advertising* and *salesmanship*. Hence the impression must be fixated for delayed response, must be remembered, and given, in memory, preference over other advertisements for similar commodities.

4. Finally the appeal must lead to specific response, to favorable action toward the particular article or brand announced.

This analysis gives us the psychological tasks of an appeal. It will be advantageous to preface our study of these four tasks with a brief examination of the pure psychology involved in these four aspects of the reflex are:

1. In the first section we have to do with the psychology of *attention* and *perception.*
2. In the second with the psychology of *attention, interest,* and *feeling,* etc.
3. In the third with the psychology of *memory, association, emotion, mental imagery,* etc.
4. Lastly with *volition, habit, instinct, effective conception, imitation, suggestion,* etc.

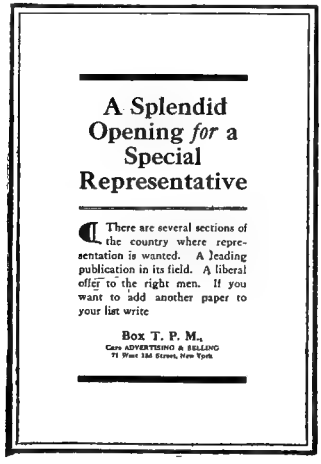
Before taking up the investigation of these four fundamental sections, we may with profit get a general view of advertisements in their different forms, see what the general psychological character of each type is, and inquire in which forms the psychological subtleties play a rôle, and in which they do not. Let us first examine the appeal with respect to its own purpose and charac-

ter, and then with respect to the medium in which it is found, for media as well as individual advertisements have their psychology.

ANALYSIS OF ADVERTISING TYPES

With respect to their quality and purpose, we may distinguish three chief types of advertisements.

I. *The Classified Advertisement.*—Here the psychological subtleties play their feeblest rôle.



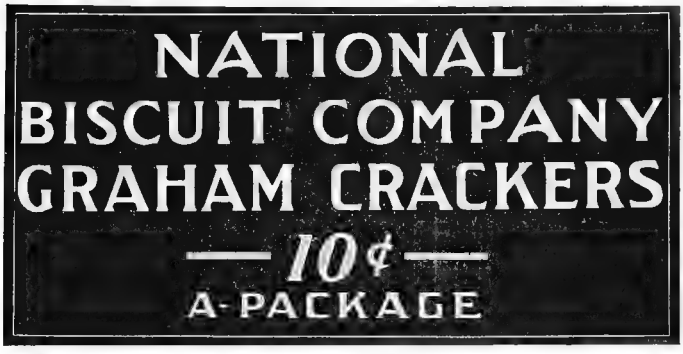
A Classified Appeal

The classified advertisement contains a simple announcement or invitation, intended only for those who are *a priori* interested in it. It will be sought

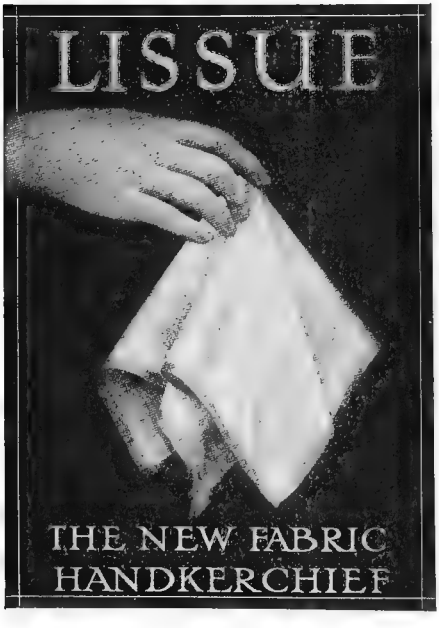
for by the proper person. In fact, you woul rather the other person did not see it. His cor respondence would only annoy you. You alread have attention and interest. You need not see for mnemonic qualities, for the right person wil surely make a memorandum of the matter. Yo will have no difficulty in provoking response. Th right person will respond without further incen tive. The only psychology involved here is th psychology of intelligibility. We must observe:

1. The psychology of expression—of clear accurate and succinct statement—and thi chiefly as a means of eliminating th wrong correspondent.
2. The ordinary psychology of typography— the laws of reading, spacing, position cataloging, color, legibility of type, etc.
3. The knowledge of media, which is not s much a matter of *a priori* psychology as matter of advertising technology and sta tistics. This is a separate field in the sci ence of business in which there is yet muc to be done.

II. *The Publicity Advertisement.*—This typ is not, strictly speaking, an advertisement at all i.e., it does not pretend to operate successively or



PUBLICITY APPEAL



PUBLICITY APPEAL

the complete arc. It is a public reminder, intended to reinforce informative appeals already issued or about to come. It usually seeks merely to familiarize a name or trade mark already known, or excite curiosity concerning a commodity about to be announced.

(1) Its psychology is usually mechanical—utilizing the principles of *size* and *contrast.*

(2) Its mnemonic psychology is also mechanical, utilizing chiefly the principle of *repetition.*

(3) But it also involves the psychology of *names,* that of *trade marks* and that of *the memorability of different kinds of facts.*

III. *Display Advertisements.*—In display advertisements the rôle of psychological factors is most prominent. The display advertisement explicitly takes the place of the salesman; it is a direct appeal, and is calculated to provoke a more or less direct, and more or less immediate response. According to its kind, it may work through the rational circuit or the feeling circuit. All parts of the arc are thus involved. It is consequently on this type of advertisement that we

will base most of our analysis, chiefly because of its ideal character. But all that is said of this

DISPLAY APPEAL

type will be seen to apply in greater or less degree to the two other types, and to all forms of business appeal which have elements in common with advertisements.

Papers Born of Necessity

EVERY "Eagle A" Water-marked Bond Paper is a paper with a reason—each was born of necessity—the necessity of having a paper which in quality, color and finish would best adapt itself to the needs of each individual user.

There is an "Eagle A" Bond Paper for the man who wants one million circulars and who figures the cost first; as well as a paper of distinctive character and exclusiveness, for the man who orders one thousand letter heads and who considers quality first and cost last.

"Eagle A" Bond Papers are not of one grade. They're of thirty-four grades. They are not for one use. They are for every use. But they are all of 100% value, whether it be a paper on which to address a bank president, or to write a memorandum to the office-boy.

To make each one of the 34 Bond Papers a Quality-plus Paper—to give to each a distinctive character and quality, color and finish—to Trade-mark the whole with the Water-mark of the "Eagle A"—and to place them within the reach of every paper-user, is a condition made possible only by twenty-nine mills, each making papers of necessity, but all united for the economic production and marketing of each particular grade.

Look for the "Eagle A" Water-mark. It's a good habit.

There are always things, the quality and elegance of which places them above the average—out of the ordinary, and the use of which lends prestige and added influence.

There are always people desirous of associating themselves with these things—the best of everything; appreciative people to whom quality in all things is paramount. To such

COUPON BOND

(For-Data Water-mark)

The De Luxe Business Paper

makes a strong appeal by its tone of character and refinement, its supreme quality and individuality. COUPON BOND is the consummate "Eagle A" Bond Paper made for those desiring the maximum of quality in business correspondence paper.

May we send you the portfolio of COUPON BOND specimen business forms? It will demonstrate how COUPON BOND may best serve your need.

Your Printer or Lithographer handles "Eagle A" Bond Papers. Ask him to show you samples. May we suggest an "Eagle A" Paper that would be best adapted to your needs?

DISPLAY APPEAL

MEDIA

With respect to media, we may briefly summarize the chief psychological characteristics, if only for the sake of having them stated. Every business man knows the points in a more or less defined way, and, indeed, with much more certainty than I do. But you will always find knowledge clarified by an attempt at expres-

sion. Expression discloses fallacies, shows up vague spots, and crystallizes truth.

We may roughly distinguish eight classes of media. The list is not complete in this day of multitudinous publicity devices, but the classes may roughly cover the field. Briefly, these classes are as follows, classified according to psychological character and situation:

I. *Newspapers, Magazines, Periodicals, Trade Journals.*—Here the appeal is more or less incidental to other matter contained in the medium. Everybody reads, and while reading may happen upon the advertisement. But the *essential* part of the medium is the other content. Generally speaking, if the appeal is to compete with this matter, it must vie with it in attractiveness and interest.

1. Studies (see Scott) of 2,000 *newspaper* readers show this to be especially true here. One-half of these Chicago men, from all ranks, read two papers daily, one-fourth of them read three, while 10% read as many as four. The average time spent on these papers daily is 10-15 minutes, though many people spend as much as two

hours. Only 4%, indeed, spent less than 15 minutes, while 25% spent more.

That news is the chief item of interest in papers is also indicated by Scott's table in which about 70% of interest goes to *news,* and only one-half of 1% *explicitly* to advertisements.

Obviously the successful newspaper advertisement must in some way compete with *news interest.* The classified advertisement does this successfully, for it is in itself an item of news to those for whom it is intended. This type of appeal, then, is psychologically adapted for newspaper insertion.

2. The display advertisement can, then, increase its power by becoming newsy. This point has already been emphasized by Kennedy in his chapter on "Advertising is News." This idea, again, is of course the basis of the well-known success of the Wanamaker news sheet in the dailies. The more the advertisement resembles *news* in its tone, the better it will compete in interest with other news items. The success of this competition is well illustrated by an incident which I quote on the authority of Edwin Balmer, who says in

"Science of Advertising": "One of the Philadelphia newspapers, which had published Wanamaker's advertisements for years, lost 20,000 circulation when the advertisement was withdrawn, and regained it again when the department store's patronage returned" (p. 20). It does not necessarily follow from what I have just said that newspaper advertising should imitate the form and style of news paragraphs. This would be too much like the old trick advertisements that began with some startling declaration which read like a news item but wound up by extolling Somebody's Bitters or Corn Salve. Advertising that attracts by deception is psychologically vicious. The point here is simply that newspaper advertisements should be informative in character, that they should really convey interesting news of stock, prices, styles, location, changes, sales, etc. The newspaper is thus specially adapted for local advertising.

3. The value of *magazines* as a medium is high, but of course depends both on the character of the magazine and on that of the subscription list. Scott observed 600

men in the Chicago public library, noticing what part of the periodical they were reading at the moment observed. He found 10½% of these men reading advertisements, and remarks that probably few did not look at the advertising pages before leaving. A prominent advertising expert, knowing the Chicago library, remarks that these results are not typical of general circulation, that libraries are always full of loafers who never buy and seldom read, but who come in to pass away the time by looking at the pictures. Concerning trade journals, little need be said. Appeals here much resemble classified advertisements. They reach a selected class of readers, those for whom they are intended, and are often, by this very fact, full of news interest of a business kind.

II. *Circulars, Hand Bills, Posters, Bulletin Boards, Electric Signs, Placards and Signs in Street Cars.*—The news interest is largely absent here, and for two reasons:

1. There is no news interest to be contended with.

2. Their size or duration forbids the news interest type for lack of space or time.

For such media the *publicity appeal* is hence psychologically adapted with its simple purpose and mechanical method. Perhaps the chief exception is to be found in the case of car advertisements. In the average city, each inhabitant, it is said, averages 10 minutes daily in street cars. As to number of people—in 1902, five thousand million cash fares were collected from passengers on street cars in the United States, besides passes and transfers. For the past year the New York subway averaged over 1,000,000 passengers daily.

Appeals here have longer time to impress themselves than in papers and magazines, and the average passenger is unoccupied. Hence, there is not so much need of devices for *catching* attention, and more room for use of logic, persuasion, affirmation, beauty, etc., than in other places. But there is more need of devices for *holding* attention because of competing cards. The effect of a suggestion is determined not only by its *force* but by its *duration* as well.

III. *Size, Form, Decoration, Color, and Illumination of Store, Comfortable Service, Waiting Chairs, Courteous Attendance, etc.*—This is a

more or less indirect form of solicitation, but a very successful one, other things being approximately equal. It is an indirect appeal to the *feelings* exclusively, hence is a distinct psychological type of advertising.

IV. *Printed and Stamped Novelties, as Lead Pencils, Paper Weights, Note Books, Calendars, Knives, Rulers, Tapes, Toys, Puzzles, etc.*—The value of these depends on their *utility,* which ensures their constant observation; their *appropriateness,* which should reinforce the mere name; and their *distribution* to the right parties, those who do the buying. I have heard of a leather wallet handed out by one John Bauer, grocer, which amply fulfilled its purpose, and led its owner time after time to John Bauer's counter. I recall, also, quantities of cheap memorandum books advertising Hostetter's Bitters which always found their resting place in the street or stove. It is probable that this medium, if carefully handled, is capable of good results and in the adequate form is not sufficiently utilized.

One of the strongest points in it is the element of *good will* created by a gift. We instinctively feel approval of the man who gives us something, and the psychology of *good will* in the novelty could be developed at great length. This is the

basis of the old idea of salesmanship *à la carte,* and though the idea is being abandoned by salesmen, this is not because it was not good in its day. It needs a rest, and soon will be as effective as ever. A good discussion of the principles underlying this type of appeal may be found in Bunting's "Specialty Advertising."

V. *Registers, Directories, Theater Programs, etc.,* Resembling Class II.—Advertisements here do not hope to compete in interest with other contents of the medium. They utilize moments of monotony or other incidental moments. The advertisements, for instance, in the directory cannot hope to compete with the reason for opening the book. They are read while waiting for "central," while waiting for the curtain to rise, or for the porter to bring in the baggage. Hence publicity or reminder will be their chief aim, except in so far as they are classified advertisements: hotels, restaurants, garages, liveries, etc.

VI. *Delivery Wagons, Street Banners, Floats, etc.*—These are commonly used for emphasizing places of business, for invitation, or for mere publicity, but also can be utilized for atmospheric effect, hence resemble Class III.

VII. *Samples, Catalogues, Agents, Traveling Men.*—The firm here comes directly to the buyer.

There is little or no question of attention. The personal element of the appeal usually guarantees initial attention and also has much to do in determining the further course of the response.

VIII. In a separate class we may include the personal communication, the form letter, the "follow-up" literature of booklet and pamphlet. This form of solicitation seems to constitute a connecting link between public advertising and the direct work of agents and salesmen. There seems at present to be some uncertainty among advertising men as to whether such appeals should so far as possible simulate personal correspondence, or whether, for instance, the form letter should be frankly impersonal. This is not a point on which *a priori* opinions have much weight. Experimental tests are needed before any safe conclusions can be drawn. An "armchair psychology" could easily specify and generalize and dogmatize here, but an experimental science must wait for more data.

Having taken this general view of the situation, let us now consider the four tasks, and study the psychological factors involved in each.

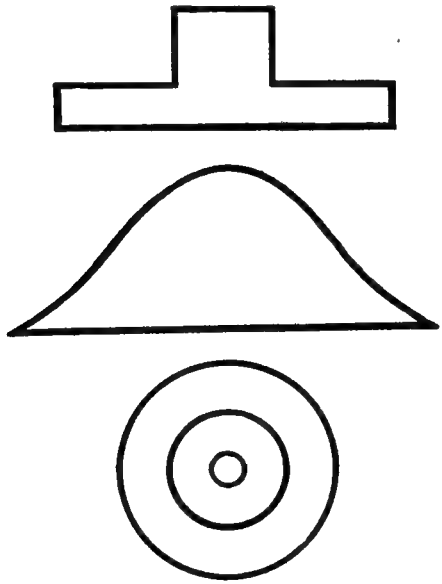
CHAPTER IV

THE FIRST TASK: CATCHING THE ATTENTION

Attention may be defined in two ways: (1) As *an act of adjustment*—or we may speak first of the act of attention. This is what happens when we take notice of a stimulus. It is almost synonymous with perceiving, and means that the given stimulus has become clear, and that there has been an act of accommodation in the sense organ employed—eye, ear, finger tips—which tends to bring about still clearer perception.

(2) This is the point at which we plainly distinguish attention according to its second definition—as a *state of consciousness,* or the state of attention. This attentive state is characterized by the dominance of one idea, image, impression, or a set of these and the subordination of all others. Consciousness always has a focal point, and this focal point is always occupied by the thing to which we are attending at the time. We may represent this state by some such figure as a wave, the crest corresponding to the focal point

and the slope corresponding to the margin of the field; or we may liken it to the field of vision which always has a fixation point which is clear and a margin which is obscure. The following figures will serve as examples:



FORMS OF FOCAL POINTS OF ATTENTION

The matter of attention is not wholly an arbitrary one. The individual consciousness does not deliberately decide what shall be attended to and what not by an act of will. If it did the field of

advertising and selling would find itself astonishingly limited in its field of effective appeal.

But the act of attention is largely controlled by heredity, past experience, mood, interest, and character of the individual. Far down in the scale of animal life we can detect the rudimentary basis of what we call attention. There we call it "prepotency of stimuli." We find these lower forms indifferent and unresponsive to many forms of stimulation, but reacting vigorously and quickly to others. These "prepotent stimuli," we find, are highly important in the life of the animal concerned, although, so far as we know, he is utterly unaware of their significance. Thus, the cock-roach always retreats from the light toward the shadow, while the moth leaves darkness for light, even singeing its wings through the irresistible attraction of the flame. The young chick pecks instinctively at certain kinds of objects, the new-born kitten is attracted by certain impressions of touch and smell and reacts to them. Even among the microscopic animals tropisms are found—certain strong and apparently mechanical reactions of approach and appropriation directed toward certain colors, objects, temperatures, etc.

So in human consciousness, not all stimuli become effective. The phenomenon of *adaptation*

clearly shows this. We soon become adapted to the presence of the hat on our head, the clothes on our back, even to the pebble in our shoe or the temperature of the stoking room. We are constantly passing things without seeing or hearing them. We come in from the night and do not know whether or not the stars are out, whether or not the evening train just came in, whether or not we locked the door behind us. There are two reasons for this apparent obtuseness:

1. *The range of attention,* which we shall later see to be extremely limited, so that at any given moment we can attend to a very few things only, being oblivious to or only vaguely conscious of all else that is happening.
2. *Attention follows interest.*—Generally speaking, we attend to things because they interest us or have some vital import in our lives. We cannot attend to things that do not have, from one point of view or another, *interest* for us, for all that we mean by the interest which a thing has is its power to attract us, to lead us about and to direct our action toward it.

There are two kinds of interesting things:

A. The first kind includes things which are interesting only because of their consequences—their immediate or remote results—such stimuli as the creaking of an axle, a sudden flash of light, the report made by a bursting tire, palpitation of the heart. These things have no intrinsic interest; we do not care to sit and contemplate them for their own sake. But they may mean some danger, they may require some act of adjustment on our part, etc. These incentives to attention we may describe by the word *mechanical.* To such stimuli we attend only until we have learned their significance, have discovered whether or not their consequences are to be important. Then we turn at once to things which may be in themselves interesting. Only children and savages are interested in these mechanical incentives for their own sake. We shall see later that this type of incentive is well represented in current devices for advertising and selling goods.

B. In contrast with this group of mechanical incentives stands another type of appeal which is in and for itself interesting—a baseball game, a battleship, an advertising speech by the Mayor, a Hecker's food advertisement, the rainbow, a gorgeous sunset, may serve as examples. Ap-

peals of this sort we may designate *interest* incentives. Irrespective of any consequences, either immediate or remote, we find these things interesting, intrinsically interesting. We not only attend to them initially, but our attention is held by them through many consecutive moments or hours. And this type of appeal we shall also find represented in current appeals employed in the business of distributing goods.

CAUSES OF ATTENTION

There are four principal ways in which attention may be brought about:

(a) By increased relative intensity of the stimulus.
(b) By the intrinsic interest of the stimulus.
(c) By accommodation of the sense organs to be used, so that the incoming impression may be received to best advantage.
(d) By preperception—anticipatory preparation, from within, of the ideational centers to be employed when the stimulus arrives.

Attention is often classified as voluntary, involuntary, and spontaneous. These forms are

clearly seen to represent only different combinations of the four methods just enumerated. Thus voluntary attention is brought about by methods (c) and (d). Involuntary attention is that produced by method (a), and spontaneous attention that effected by methods (a) and (b). It is apparent that advertising can employ only two of the four possible methods of attracting attention, namely those two methods by which spontaneous attention is brought about. It follows, then, that these two methods must be used as effectively as possible. It is, of course, further true that when we come to the second task, that of holding attention, we shall see that voluntary attention may also come to play an important part.

RESULTS AND LAWS OF ATTENTION

Before further analyzing these methods of intensity and interest, let us learn what the result of attention will be when we have once secured it. The results of attention will determine to a great degree the nature of our next inquiry: "How can an appeal attract attention?" Before we turn to advertisements in particular, what are the results or laws of attention, in general?

I. *The process attended to becomes clearer and more distinct than others.* This is well illustrated

by attention to the hidden figure in a puzzle-picture. Attend to the figure, it looms up clearly, while the rest of the picture fades into the obscure margin of consciousness. Attend to the background, on the other hand, and this in turn becomes sharply defined, while the hidden figure is blurred.

II. *The process attended to becomes more intense,* especially if it was originally very faint. Attend to a very faint light or a sound—a star or the tick of a watch—or attend to a particular instrument in an orchestra. The stimulus attended to becomes not only clearer but it seems to be louder as well.

III. *The process attended to becomes increased in duration,* especially when it is otherwise very short. Moments of time, if attended to, pass slowly. The long drawn out diminuendo of a violin may seem continued after the actual vibration has ceased, especially if the suggestion is reinforced by continued movement of the bow. The headlines which compel strong attention or the cuts that attract the eye persist in consciousness according to the degree of attention bestowed upon them. Because they persist longer they have greater opportunity for association with other experiences, and hence are more likely to be recalled

than some other processes attended to less intently. This result is closely related to the next law.

IV. *The process attended to rises more quickly into consciousness* than do other processes entering simultaneously. We can illustrate this by the "complication experiment" of the laboratory. If in this experiment a sound and flash of light are so arranged as to occur at the same moment, they will seem not synchronous but successive, the one attended to appearing to precede the other. Under this law we may also put the general fact that at a subsequent time, if there is occasion to recall the process, the one attended to most strongly tends to recur more quickly and easily than others.

The foregoing related laws are both theoretically and practically important. From them it follows not only that an appeal should be able to attract attention, but that, other things being equal, it should attract as much attention as possible. For the appeal compelling the strongest degree of attention will be clearer, more intense, and more active than that less strongly attended to. As we shall see later, the power of a suggestion depends not only on the fact of attention but also on the degree of attention.

V. *Attention is the basis of every will-act,* and the only basis. Every idea or impression has its inevitable motor issue. Nervous energy, once generated, must be liberated, discharged, over an outgoing pathway. Just what pathway is taken is immaterial so far as the nervous system is concerned. It follows, then, that the response to the stimulus which is strongly attended to drains off the energy generated by marginal stimuli, with the result that this response is strengthened. This is the basis of an act of will or choice. It is the fundamental principle of response. When two processes divide the field of attention between them, each tends to set off its appropriate response. The result is two weak responses, or, if the two stimuli are antagonistic, no response at all. If my attention now shifts from one to the other, I vacillate, am weak-willed, undecided. But the moment that I attend exclusively to either idea, its motor consequences ensue at once, and I have responded to the suggestion. I have willed. This is the fundamental law of suggestion and response. Every idea, if attended to exclusively, tends to realize itself in action. We will have this principle before us again when we come to the third task of the appeal.

Do not be impatient with this prolonged analy-

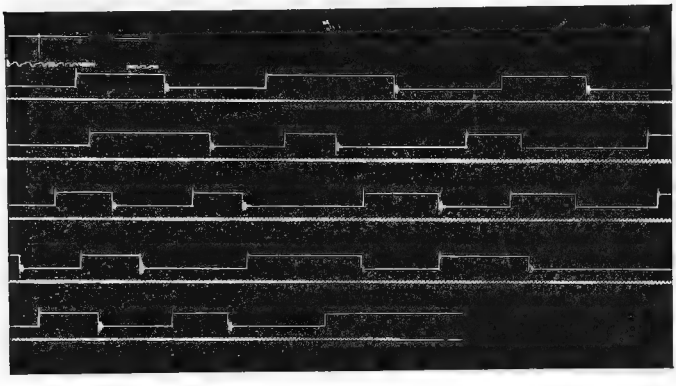
sis of the attentive state. We are trying to get at the very bottom of the principles of appeal and response, and this rather abstract examination is essential to the more concrete things that are soon to follow. To discuss many other extremely interesting results would be to go too far afield for the purposes of this book. But there are two more principles that must not be omitted. From the practical point of view they are the most important of the seven. They cover not so much the results of attention as they do the behavior of attention itself.

VI. *This law is that attention fluctuates,* comes in beats or pulses; the state of attention is of short duration. Our consciousness cannot remain intent on one object or idea. It must roam about, much like a bird flying from bough to bough. It cannot remain on the same bough constantly. It must, after a given time, leap over to another bough and then return, or else it must shift its position on the same bough every so often, changing from one foot to another or facing about or lighting on various parts of the same perch.

The length of these waves or pulses of attention is usually about four seconds in our experimental researches, two seconds coming to the crest and two seconds dying away. Much work is be-

ing done by modern experimentalists to discover the neurological reason for this rhythm of attention. It constitutes a fascinating field of modern investigation. But, here again, to go farther would be to digress.

I show you here the record of such a laboratory experiment, taken by one of my students.



AN EXPERIMENT ON ATTENTION. The wavy line marks off fifths of seconds. When the straight line is on the low level, a faint visual stimulus was in the field of attention. The high level indicates the disappearance of the stimulus from attention.

This law of attention will be our chief concern when we come to the second talk, that of Holding Attention.

VII. Finally, in this abstract analysis, we must include the general law that *the range of attention is limited.* We may distinguish here between

the *focus* of attention, and the *margin* of attention. You will all remember in this connection that five acts have long been recognized as the artistic limit for a drama, five feet for a line, and preferably five lines for a stanza, five chief characters in a dialogue. And these are all cases where one has the sympathy of the reader from the beginning. In framing the artistic solicitation for his eye, it is better to be on the safe side and allow, say, one fact to the focus, one to the field, and one to the margin. But it may be said here that it is five *units* that can be compassed in a single act of attention. If I expose five or six small dots for a fraction of a second you can report their number correctly, but more than that many you cannot perceive accurately. You can, however, see five letters, each composed of dots, just as easily, and even five words, if the words are familiar enough to be perceived as units.

These facts have a very practical bearing. They mean that the ideal headline should not contain over five units. Usually these units will be single words. But as a matter of fact a sentence can be grasped as a whole providing it can be broken into, say, four phrase units of perhaps four words each, or, preferably, three. If I say, "The proper length for a comfortable sentence is felt to be

about sixteen words," my sentence is seen to be thus constructed. It has four phrase elements of three or four words each, and the sentence is easily grasped as a whole. But if I say, "By a careful experimentally conducted investigation of the laws of attention, psychologists have been led to conclude that the most favorable sentence length for the average reader is, under ordinary conditions, approximately sixteen single words," you are dismayed by the length and structure of the sentence. It falls to pieces, requiring more than one effort of attention. We may say, then, that nine to sixteen words make a clear and easily read sentence. That is, of course, only an approximation. The actual number in any given case will depend on the ease with which the single words group themselves into phrase units. But good headlines will seldom be found with more than nine and usually not more than five words. We shall have a great deal to say about this law of attention when we come to consider the second task.

CHAPTER V

MECHANICAL INCENTIVES

So much for the state of attention itself. Let us now turn to the concrete ways of bringing it about. You will recall that the advertisement can only work through spontaneous attention, and that this state can be brought about by two means: (1) By the *relative intensification* of the stimuli. Under this head comes the group of methods which we have designated *mechanical devices.* (2) By the *intrinsic interest* of the stimulus. This group we classify as *interest incentives.* Naturally and inevitably, through the very structure of our nervous systems, we attend to stimuli of these two kinds. The basis for their power over us lies either in the physiology of all nerve tissue, in the inherited results of remote ancestral experience, or in our own peculiar past history and desires for the future.

Of the two groups, the mechanical devices, although the chief means employed by past and even by most contemporary advertising, are the least

potent and in many cases are futile, so far as real returns are concerned. I have often been asked to state what in my opinion would be the next advance step in advertising. I should say that the most effective change for the better that could be made is the change from mechanical devices to interest incentives. But the mechanical devices are much used at present, and will probably always be employed to a greater or less degree; and for certain types of advertising mechanical devices are effective. The mechanical devices fall into six chief classes according as the method used is a variation of *intensity, magnitude, motion, contrast, surrounding* or *position.*

1. INTENSITY

Other things being equal, we will, of course, attend to the strongest stimulus. We listen to the shrillest newsboy, the loudest barker at the side show, just as we let the thunder distract us from the chirping of crickets. But this is not due to genuine interest in the strong stimulus. A strong stimulus causes nervous shock and is likely to constitute or indicate a source of danger to the organism. Those of our ancestors who failed to notice intense stimuli perished in avalanches, tornadoes, etc. Only those survived

whose nervous systems were sensitive to abrupt changes, and they passed their constitution on down to us. Besides, a strong stimulus means much physical energy impinging on our sense organs, and this sets up strong nervous currents which force their way inward in spite of our wishes. Fortunately, however, advertising has but little use for this device. Advertising is chiefly a visual matter, still more chiefly a matter of printing, and the range of possible intensities in printing is very slight. The intense lights of an electric sign, the brilliant colors of a billboard placard may force us to look in their direction. But they may force us just as quickly to look away again. They may attract attention, but they lack the power to hold it. All advertising that depends for its success on the mere noise it makes, on the sheer intensity of its horn, is likely to find the two to be in inverse ratio. Only savages and children, as we have said, delight in intensity of stimulus for its own sake. Savages beat their tom-toms and children pound and kick from delight in the activity of a sense organ, and perhaps also because their undeveloped senses do not get the same degree of sensation from the intense stimulation that we do.

The rumble of the elevated train never attracts

my attention unless it interferes with my present activity, and even then it does not attract but repels me. But the plaintive squeal of some old woman's hand organ, the whistle of a fraternity brother, some curious brogue in the speech of a passerby, some comic incident of the street, attracts me at once in spite of its mildness. A man slipped on the icy walk the other day. He made no noise, but slipped down softly and flatly. The negro garbage collector who happened to be passing saw him just as he was clambering to his feet again. "Do it again," shouted the driver of the garbage wagon, "I didn't see you that time." This trivial incident had greater attention value with the driver than did the roar of the traffic around him.

The noisy honk of the automobile does not attract you but gets you out of the way. The intense stimulus means danger. The soft siren call on the automobile had to be abandoned, not because people would not attend to it, but because they did not run away from it. If you want to appeal to children and to savages, then, you may use the intensity device with some degree of effectiveness. For civilized people and grown-ups the blaring seldom attracts attention beyond itself.

2. MAGNITUDE

Much has been written concerning the relative attention value of small and large spaces, cards, signs, cuts, type, etc., in advertising, and several suggestive attempts have been made to study the matter experimentally. The opinion of advertising men seems to point to proportionate increase in values with the amount of space used. The use of full-page advertisements has increased, as Scott has shown. Thus in 1892 the *Century Magazine* contained only 18 per cent. full-page advertisements as compared with 43 per cent. in 1908. There is also a tendency to use two page "spreads" more and more.

Scott tested over 500 people, giving each the same magazine (*Century*), asking them to "look it over" in a general way, but not to read long articles or poetry. After having examined the magazine for 10 minutes, each was asked to write out all he remembered of all the advertisements he had seen. The same investigator also made up a magazine by choosing 100 pages of varied advertising pages from a large number of magazines, so as to get variety of material, size, form, type, etc. These pages were then bound together along with reading matter and 60 adults

were asked to "look through" the magazine, for an average time of 10 minutes. Each then mentioned each advertisement remembered, gave its contents, and was then again given the magazine and asked to indicate all the pages now recognized as having been seen before.

The results of these experiments were as follows: In the number of times the advertisement was mentioned from memory, in the number of times it was later recognized, and in the number of times it conveyed definite information as to the general class of goods advertised, the specific name or brand of the goods, name and address of the firm, price, etc., the rule was general that the full page was more than twice as effective as the one-half page. The half-page was also more than twice as effective as the quarter-page, and this in turn more than twice as effective as the eighth-page. Scott's general conclusion is: "The attention and memory value of an advertisement increases as the size of the advertisement increases, and the increase of value is greater than the increase in the amount of space used."

But Scott points out the fact that the *quality* of the advertisement, that is its content, is even more important than its size. Indeed, it is quite probable that the increase in value with increase

in space, in these experiments, was chiefly due to difference in the contents of the space. A large advertisement is likely to be different from a small one in things other than mere magnitude. The large space permits the use of pictures, of suggested action, removes competition by monopolizing space, and also makes possible greater contrast and clearness. It is probable, then, that the increased value of a large space in these experiments came not from the mere fact of magnitude, but from the presence of *interest* incentives which the magnitude makes possible, but of course does not necessarily involve.

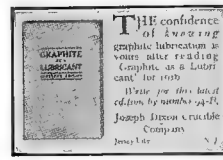
When the content of the space is kept constant in character and interest there is no evidence that the increase in returns is nearly so great as the increase in space and cost. Of course, the larger advertisement will be more likely to be seen, but it must be seen and read twice as much or more than this to justify the increase in cost, if a whole page is compared with a half page. Time after time the results of mail order advertising are said to have shown only an increased cost per reply when greater space was employed. The writer has on hand sets of advertisements in which the character of the content, the medium, and the commodity advertised have all been kept constant and

the returns measured by the number of inquiries for booklets, etc. The results from these sets suggest a more or less definite law of increase under such circumstances, namely: *the number of inquiries tends to increase as the square root of the amount of space used.* That is to say, use four times the space and you double the returns; use nine times the space and you treble the returns, while to quadruple the number of replies would require sixteen times the amount of space, other factors remaining constant. Some such law of increase may, in fact, be supposed to operate in the case of all the mechanical incentives.

This is an interesting point, psychologically, for it falls in line with what is known in the laboratory as the psycho-physical law, according to which the sensation produced by a stimulus does not increase in the same ratio as does the increase in the objective intensity of the stimulus, but much more slowly, approximately as the square root of this intensity. We know that, in many other fields beyond a certain point this law of "diminishing returns" holds—to double the amount of coal consumed does not double the speed of a boat; nor can twelve laborers produce, from a given limited area of land or a given factory equipment and floor space, twice the produc-

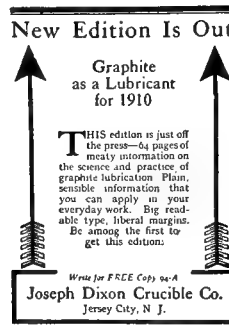
tion of six laborers working under the same conditions.

The following series of Graphite advertisements indicates a similar law. These appeals ap-



AD. NO. 1—32 REPLIES. ⅛ PAGE

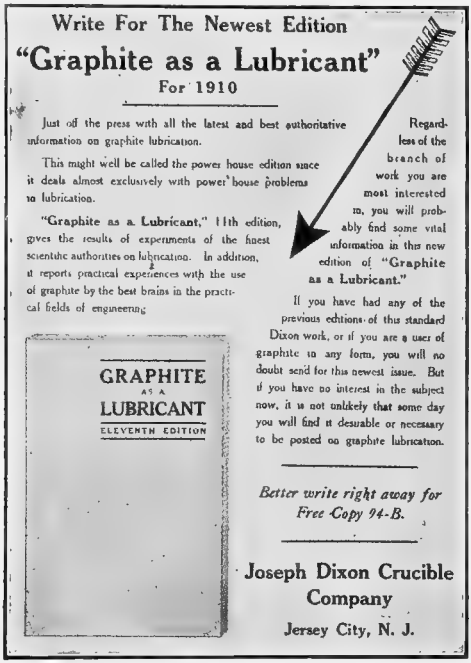
peared under the same conditions of commodity and medium, and all three rely on the same general type of attention device. No. 1, an advertisement occupying one-eighth of a page, brought



AD. NO. 2—32 REPLIES. ¼ PAGE

32 replies. Several others of the same size and type brought from 21 to 42 replies. No. 2 presents the same appeal, with perhaps a somewhat

better layout, so far as initial attention value is concerned, and it occupied one-quarter page, twice the amount of space occupied by No. 1. But it



AD. NO. 3—75 REPLIES. FULL PAGE

brought only the same number of replies. No. 3, very similar to both 1 and 2 in general content, but occupying a full page, brought only 75 replies. That is to say, it is four times the size of

No. 1, but brought only twice as many replies, as we should expect, under the square root law.

Of course if the style of the appeal is changed, these results will vary correspondingly. Thus No. 4, which introduces an *interest* incentive (picture, suggested activity) is no larger than No. 2, but

AD. NO. 4—186 REPLIES. ¼ PAGE

brought 186 replies. This last appeal will be referred to again under the section on suggested activity.

Münsterberg has recently reported experiments designed to measure the value of large spaces, appearing once, as compared with that of smaller spaces appearing often enough to make the final space occupied equal in both cases. Based on the total attention and memory values, the relative values are as follows:

Full page, appearing once	.33
Half page, appearing twice	.30
Quarter page, appearing four times	.49
Eighth page, eight times	.44
Twelfth page, twelve times	.47

On the basis of the chances of the advertisement being included among the first 10 remembered, in time, the values are:

Full page, appearing once	0.5
Half page, appearing twice	1.2
Quarter page, four times	2.9
Eighth page, eight times	2.3
Twelfth page, twelve times	2.4

In general, that is to say, the small spaces repeated are more effective than the large space appearing but once. Of course, these values are not entirely dependent on the difference in space, but also upon the factor of *repetition,* which is in itself a form of mechanical device, if the appeal is attended to when repeated.

Further information bearing in this same general direction is afforded by several experiments conducted by Dr. E. K. Strong, Jr., Research Fellow in Columbia University, for the New York Advertising Men's League and the National Association of Advertising Managers. Perhaps the only argument in favor of magnitude is that advanced by some practical advertising men, to the effect that the additional prestige and suggestion

of prosperity conveyed by the large space employed tend to create a favorable impression in the mind of the reader.

So far as the experience of the psychologist goes, mere magnitude possesses the same defect as does mere intensity, and to even greater degree. The large object does attract initial attention. Unusually large things possess a certain importance in the life of any animal; they are likely to be dangerous, unmanageable, to be avoided, etc. Therefore, the first appearance of a mammoth billboard or electric sign will attract attention. But as soon as the real character, the harmlessness, of the thing is learned, it will be passed by unnoticed, just as are the Singer building, the Metropolitan tower, the *Imperator,* and the enormous signs and displays of the Great White Way. Magnitude in advertising is probably of real value only in so far as it makes possible certain more genuine interest appeals.

The question of size of type has also received frequent discussion and investigation. Gale found progressive increase in attention value with increase in size of type from two to six millimeters. He gives the table on page 73:

Scott studied two kinds of type with the same body, but one of which had light and the other

heavy face. What he tried to discover was the time required to read these two kinds of type and the number of errors made in such reading. For the light faced type the total time of six observers was 147 minutes, the number of errors 132. For the heavy face, the total time was 129 minutes, the

TABLE IV

Height Type	Relative Legibility, Per Cent.		
	Men	Women	Average
2 mm	8.7	11.6	10.1
4 mm	20.2	15.8	18.0
5 mm	27.7	27.5	27.6
6 mm	43.0	45.0	44.0

errors 91. Such legibility tests should be carried further. But it must not be supposed that legibility and attention value are the same thing. It is in general true that the more easily type can be read the more agreeably will the people read it. But they will not be likely to read it just because it is legible. Under a given set of conditions a certain type size, a certain spacing and massing will be most favorable. But adequate tests of this matter, from the practical point of view, have not been made. More will be said on this topic in another connection.

The writer would, then, be inclined to stress the

futility of mere size as an effective advertising device. On psychological grounds the small advertisement with *intrinsic interest* of some sort or other—color, cut, action suggested, comic, appeal to special instinct or feeling or value, will be more effective, and less expensive as well.

3. MOTION

The third mechanical incentive to attention is that of a moving stimulus. An object in motion has much higher attention value than a stationary thing. This is true far down in the animal scale. One may approach very close to a wild animal so long as one's accessory movements are inhibited. A squirrel may perch on my hand, but the slightest movement of a near-by object suffices to send him scurrying. Hold your finger, for instance, in the edge of your field of vision; you are not able to see it, but wriggle it a little and its image becomes at once distinct. Psychologically there are two reasons why this should be true. One is an interest reason, viz., the fact that moving objects are more likely to contain in them possibilities of good or evil. Hence from earliest experience moving objects have become of unusual interest and significance for us. The second reason is a mechanical one, viz., that sensation is

only consciousness of change. We become rapidly adapted to a constant stimulus so that we fail to notice the weight of our hats, the temperature of the room we are in, the odors of the subway. But the moment a change occurs it is detected, because it involves fresh and unfatigued sensitive surface. So keen is our sense of movement that we can detect the motion of a point on the skin long before we can tell the direction in which it is traveling. This is the basis for the high attention value of rotating barber signs and display shelves, shifting bulletin boards, moving pictures, flash lights, moving frames in shoe and hat stores. The Old Dutch Cleanser in Harlem, and the Heatherbloom petticoat sign are instances of the initial value of movement, as are running lights and serpentines. The use of movement is certainly one of the most effective of the mechanical incentives, but it has in common with all mechanical devices the fault of failing to hold attention when once it is caught, and the further defect of rapidly undergoing adaptation. You must not confuse the actual use of movement with the somewhat related principle of suggested action. Nothing has higher attention value than the reproduction of a fellow creature in action. But this is much different from the crude use of mere mo-

tion of an inanimate object. It is strictly an interest incentive and will be considered fully under that heading.

4. CONTRAST

The next important mechanical device is that of *contrast.* Because sensation is the consciousness of change, any great or striking difference in the intensity, size, color or character of the stimulus produces an unusually vivid consciousness. The gradual appearance of an electric sign would pass unnoticed, but the alternation of its sudden illumination and disappearance at once attracts the attention. In the same way a striking difference between foreground and background has strong attention value, and black on white, blue on yellow, red on green are the most striking combinations of color, because the two members of each pair are contrasting in color. A small man and a large woman, a Shetland pony harnessed alongside a draught horse, would have a similar attention value. So, in looking through the advertisements of a magazine, any sharp departure from the usual appearance of the pages in size, form, color, style of type, content, size of type, kind of cut, possesses strong attention value. And in our day of manifold advertisement

pages this is an important item. The defect of the contrast incentive again is that of all the mechanical devices. To be effective it must be reinforced by an interest incentive, or else it fails to hold the attention it has gained by sheer force.

WHITE ON BLACK

The writer has frequently been asked why black on white attracts more attention than white on black. The contrast is apparently the same here, and the principle of irradiation would lead us to expect just the opposite result. The reason is

probably that we habitually associate *dark spaces* with objects and *light spaces* with background—with air, opening, sky, water, etc. It is always the positive, active features of our environment, the *objects,* to which we give special notice. Backgrounds have no particular importance except as they set off objects. So when black letters are seen on white the letters attract attention. But when white letters appear on black, they seem to be merely *holes* in the *object,* which is now the dark part. Hence we do not attend to the form, etc., of the letters. So far as acuity and legibility go there is no difference between the two arrangements.

5. ISOLATION

Closely allied to contrast is another factor —the *absence of counter attraction.* Consciousness is never empty. If it were it would not be consciousness. This means that we *must* attend to *something,* and, for the most part, to something in the outside world. In the absence of counter attraction consciousness fixates the one thing in the field. The value of monopolizing the whole space, of eliminating competing appeals by employing plenty of white space, etc., has its basis

here. Little more need be said. The difficulties with this device are: (1) that we quickly become adapted to its artificial character, (2) that there

ATTENTION VALUE OF ISOLATION

is always more than one field open to consciousness, and it is necessary to make the page, wall, side of the street, etc., have some *intrinsic* interest before the absence of counter attraction in that particular field has a chance to work.

ABSENCE OF COUNTER ATTRACTION

6. POSITION

The final mechanical device is that of *position*. Because of certain habitual fixation tendencies of the eyes in reading and observing, certain positions on a printed page, a bulletin board, etc., have greater attention value than others. Thus, in

Gale's experiments the left side of the page was found to have greater attention value than the right. This result would follow from the tendency to begin on the left and read to the right, so that in a quick exposure such as Gale gave the left side would have the advantage, and especially so since he studied the page when it was taken out of the magazine and presented as a flat surface. Starch experimented with nonsense syllables placed in different positions in a pamphlet of twelve pages. On the third and eighth pages the same syllable occurred. Fifty people looked through the pamphlet and then wrote out all the syllables remembered. Of those occurring on the left side of the page 44 per cent. were recalled, while 56 per cent. of those on the right were recalled. This contradicts Gale's results.

The experiments are complicated by the fact that in reading the eye has a second tendency to fixate the object in each hand—the part of the page held at normal reading distance. This will be in magazines, and especially in newspapers, the two outside columns, one of which is on the right, the other on the left. Starch's experiments further erred in using such unusual and artificial things as nonsense syllables which vary greatly among themselves in attention and memory

value. From general knowledge of the laws of reading and eye movement, however, I will venture to prophesy that in flat surfaces the left side will be found to be most favorable, in newspaper pages the *outside* spaces, that is, the left on the left-hand pages and the right on the right-hand pages, while on magazine pages there will be little difference found.

A second question relating to position concerns the relative value of the top and bottom of the page. Psychologically there are two factors that work here:

(1) We tend to find *meaning* in the top of things, the faces of our fellow men, the branches of trees, etc. We begin to read at the top of the page. Further, in reading, experiments show that the upper part of the printed letters is more significant than the lower part and that the eye does not run along the middle of a printed or written line but rather along a line between the middle of the small letters and the tops of the high ones, that is, a line somewhat above the center.

(2) In fixating a general object, especially a work of art, a picture, wall, etc., there is a constant tendency to fixate the center. This gives us

the best view of the object as a whole and also enables us to perceive its unitary structure, balance, proportion, etc.

Here are, then, two tendencies. The result is a compromise, in which the space between top and center has greatest advantage. Experiment confirms this result. Thus, in Starch's tests, the value of the upper half of pages was 61 per cent., as against 39 per cent. for the lower half, when the page was divided into quarters. When it was divided only into halves the same law held, the values being, upper half 54 per cent., lower half 46 per cent. Gale, studying flat surfaces, divided into horizontal quarters, found that the quarter just above the middle was strongest, and the bottom weakest.

Finally, in this problem of position there is the question of preferred pages. The fact of preferred pages is recognized by magazine rates, but the policies here are quite discordant, some making great and some relatively small extra charge for preferred positions. Starch studied this problem using nonsense syllables with his twelve-page pamphlet. He found the following results:

DATA

Total number recalled	261
Average number on outside cover recalled	34
Average number on inside cover recalled	26
Average number on other pages recalled	17

This indicates the outer cover to be twice as effective, and the inside cover to be half again as effective as the ordinary inside pages.

Using real advertisements instead of the syllables, the results were: preferred positions, average 19.2 times; non-preferred positions, average 6.5 times. But these figures are highly unreliable because the advertisements themselves differ greatly in attention value, familiarity and interest. Furthermore, all the inside pages are lumped together, with no attempt to discriminate between, say, page 3 and page 7, or between back half and front half of the pamphlet. Moreover, the value of other preferred pages, such as those next to the reading matter, is not considered.

The following figures resulted from a preliminary experiment performed by one of my students. A magazine containing 10 pages of advertising matter in the front section and 10 in the back section was chosen. A set of trade marks (geometrical forms of solid black and of approximately the same area) was affixed, one to the center of each of these pages. The relative attention value of each of these forms, when all were seen under the same conditions, was determined by a careful experiment with 25 people. After this had been done it was possible to allow for the dif-

ferences in attention value, due not to the page itself, but to the form which it happened to carry. Thus, if the form on page 3 was found to have 2.5 times the attention value of the form on page 7, the results from page 7, when multiplied by 2.5, might be supposed to be absolutely comparable with the results from page 3, and any difference between the two, after this compensation had been made, would reflect nothing but the relative attention value of the two pages themselves. The experiment thus attempted to conform to the first requirement of a scientific experiment (curiously neglected in reported tests of advertising values), namely, that the only variable factor be that which is being specifically investigated, or that, if other factors vary, this variation be also measured and reckoned with in the valuation of the final returns. The set of trade marks, with their relative attention value, will appear in another connection.

A group of 25 subjects was then allowed to look through the magazine for a limited time, without being told the purpose of the experiment. Each subject took the magazine from a shelf of books, and looked through it in his own way. He was later presented with a complete set of 50 geometrical forms and requested to pick out the

20 forms that he had previously seen in the magazine.

The results were then transformed into comparable quantities, in the manner just described, and in this way the relative attention value of the various pages, when the magazine was handled in this way, was determined. The following table resulted:

TABLE V

Front Section	Value in Per Cent.	Back Section	Value in Per Cent.
Page		Page	
1	34.4	11	48.6
2 or 3	44.2	12 or 13	21.5
4 or 5	38.0	14 or 15	31.5
6 or 7	43.9	16 or 17	30.4
8 or 9	39.1	18 or 19	32.4
10	69.0	20	20.0

Average of front section, 43.4; average of back section, 30.0.

Several facts are clearly evident here:

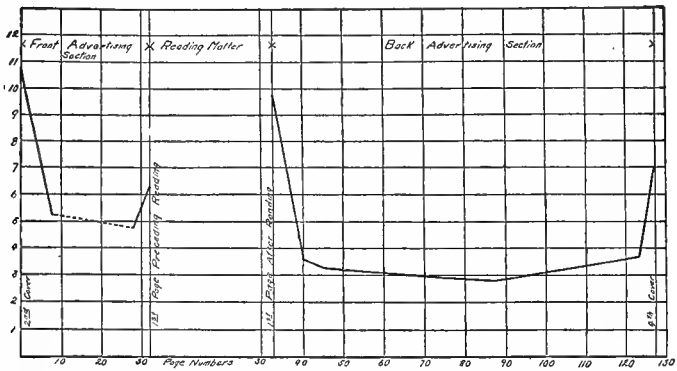
1. The value of the front section is almost 50 per cent. better than that of the back section.
2. The best page of all is the page next to the reading matter in front (page 10, 69 per cent.). The next best is the page next to the reading matter behind (page 11, 48.6 per cent.).

3. The front cover (page 1) and the back cover (page 20) turn out to be the poorest pages of the whole twenty.
4. Aside from the front cover and the page next the reading matter, all the front pages are of about equal value, when the section is limited to 10 pages.
5. Aside from the back cover and the page next to the reading matter, all the back pages are of about equal value.

Here are a number of experimental facts that are in striking contrast with the common theories of preferred position. To be sure, the results cannot, without further verification, be transferred to conditions other than those in which the experiment was performed. But other tests seem to indicate that all the rules which hold in this experiment also hold when the sections are much larger, when actual advertisements are considered instead of geometrical forms, and when the magazine is taken home and read in the ordinary way.

The following curves give the results of an elaborate experiment performed by Dr. Strong, for the purpose of determining the relative value of preferred pages in a larger magazine than the

small one employed in the case of the experiments I have just described. This experiment conformed even more closely to the conditions of actual reading habits. The procedure is described



RESULTS OF ONE OF DR. STRONG'S TESTS ON ATTENTION VALUE OF DIFFERENT ADVERTISING PAGES IN EVERYBODY'S MAGAZINE. The figures at the left represent the percentage of 137 women who noticed the advertisement in the various pages. The figures across the bottom indicate the number of the page in the advertising sections. The advertisements on the covers were not considered. For example, the advertisement on the page opposite the second cover was noticed by 10½% of the women tested, the advertisement on the page just preceding reading matter by 6¼% of the women, the advertisement on the page just after reading matter by 9¾% of the women, and the advertisement on the last page opposite the third cover by 7% of the women. Contrasted with these preferred pages we find but 2¾% of the women noticing advertisements in the neighborhood of page 88—the center of the back advertising section.

by Strong as follows: "A professor assigned his class as necessary reading an article in the September issue of *Everybody's Magazine*. Each member of the class was supplied with a copy of

the magazine, and was allowed to keep it one week, after which time it was to be returned to the class room. Each person was then given an envelope containing all the full-page advertisements that had appeared in the issue and a good number of others from another issue. They were requested to look through these and select those they remembered as having been in the magazine. One hundred and thirty-seven people were thus tested, ranging in age from 18 to 50. A number were married, and all were in the Domestic Science Department of Teachers College, and especially interested in problems of the household. Many are right now the buyers for homes, and most of the remainder are qualifying to become so in the near future.'' These results are seen to confirm all the generalizations based on the earlier experiment, except that, because of the length of time which the magazine was used, the cover pages came to have higher value than was accorded them in the earlier tests.

This completes our study of the *mechanical incentives,* their characteristics, laws, and relative values. In general we may say that these incentives are crude and unsatisfactory. After having discussed the *interest incentives* in a similar way, I shall give an account of an interesting

demonstration and proof of the inferior value of the mechanical group. The essential thing about a successful appeal is that it shall be able to sustain the attention it has once caught, and the mechanical incentives in themselves fail to do this. Only attention based on interest is likely to be held long enough for the suggested idea to realize itself in action. The *interest incentives,* then, are the effective ones. A study of these factors we are to take up in the next chapter.

CHAPTER VI

INTEREST INCENTIVES

Interest incentives fall under the headings of eight chief principles. These are the most effective devices for catching the attention in a permanent way. Their chief strength is derived from the fact that the *feeling of interest,* which is essential to *sustained attention,* is the very basis of their initial attraction value. These eight incentives are the appeal through:

1. Novelty: bizarre effects, unusual devices and statements.
2. Color: brightness, tone and harmony.
3. Illustration: cuts, photographs, sketches.
4. Action: suggested activity on the part of persons or things.
5. The comic: pictorial and verbal humor.
6. Feeling tone: pleasantness, excitement, strain and their opposites.
7. Instinctive response: any appeal to a fundamental instinct.

PRINCIPLES OF APPEAL AND RESPONSE

8. Effective conceptions: appeal to established habits and ideals.

1. NOVELTY

The basis of the value of novelty as an incentive is twofold. Recall the extreme importance, in the lives of our ancestors and in our own experience, of unusual objects, new situations, unaccustomed stimuli. The organism is perfectly adapted to familiar objects, but strange ones can only set up disturbed or random responses, and hence cause the feeling of shock. We are startled by the novel. It is full of interest to us both on account of the *danger* it may contain and on account of the *good* it may afford. Hence we always attend to it closely when we discover it. This incentive is closely related to the *instinct of curiosity.* Curiosity is merely the name for our interest in the unknown or unfamiliar. Throw a strange object into the field and the horses and cattle will circle around it, sniffing, poking and snorting until they seem to have discovered all the possible sources of activity to be anticipated from the object. If the object shows no new traits, but behaves just as the old familiar objects in the pasture, the cattle soon scatter away

and are hereafter unconcerned about it. But if it shows any new or unwonted characteristics, the

the thing is sufficiently curious, the observer is likely to keep his attention fixed until the advertisement has been thoroughly digested.

NOVELTY AS AN EFFECTIVE ATTENTION DEVICE. This also illustrates an important principle of PERCEPTION, *viz.*, that one "sees" not so much what the sense organ affords but rather what the present stimulus has been *learned to mean*. Sensation is supplemented by perception. In the above picture only parts of the objects are given in sensation, but the objects are nevertheless perceived as wholes.

animals are interested in it for days and may be observed constantly examining it. The same is true of a child with a new toy.

Herein lies the strong attention value of all devices designed to arouse curiosity—bizarre figures, cuts, shapes, grotesque faces, novel forms and arrangements, new type faces, curious spell-

THE CONVENTIONAL

have frequently carried on advertising campaigns based on the novelty incentive, introducing unheard-of specialties and stunts into the service. Newspapers, politicians, purveyors of foodstuffs, publishers, clothiers, dealers in every commodity except perhaps large staple products, machinery,

etc., use this incentive to advantage. The element of novelty attracts the attention initially, and, if the thing is sufficiently curious, the observer is likely to keep his attention fixed until the advertisement has been thoroughly digested.

EXTREMES MEET.

"It's only an extreme type of people who carry a fashion to its extreme limit."

This winter we've carried out the ideas expressed by the "Clothier and Furnisher"

"Dignified clothing cut on conservative lines will be the selection in demand for winter."

Our suits and overcoats while embodying all the novel features in cut and fabric are in the common-sense, becoming, fashionable class.

Suits $15 to $40.

Overcoats $15. to $45.

It's time to turn those negligee shirts out to grass.

October is the time for the stiff bosom shirt to be firm in its demands on your attention. We have 'em in short bosoms, so now all the old discomforts are avoided. Try 'em.

Unique designs in new fall neckwear.

Special display now.

THE NOVEL

If possible, the novelty should be intrinsic, not simply obtruded as an attention device. In the illustrations given, this latter situation is very likely to be the case. A good example of effective and intrinsic novelty is the assertion made by the advertisements of 3-in-1 Oil: "Men shave with

it." The Brownies, Gold Dust Twins, Sunny Jim, the Herpicide cards, etc., may be cited as attempts to employ the novelty device for purposes of attention.

The chief danger in using the novelty incentive is, of course, that of emphasizing the novelty rather than the product.

2. COLOR

The *use of color* for advertising purposes depends chiefly on the strong and lasting interest that all living beings have in color. The lower animals develop gorgeous plumage during the mating season, when the attention received is a chief item in the life of an individual. The savage will barter his weapons and choice possessions for bright red blankets or a chain of tinted beads. The most civilized of us loves to adorn himself with modulated hues and harmonious color schemes. Moreover, colors differ greatly in their influence. Far down in the scale of living things can be seen color preferences more or less physiological in kind. Microscopic animals are attracted by some colors, repelled by others. Bulls and frogs, with their well-known reaction to reds, illustrate the point.

The red-yellow end of the spectrum, generally

speaking, is warm and active. It is stimulating, exciting, sometimes irritating. The green-blue end, on the other hand, is cold and passive. Its action is in general depressing, quieting. To "have the blues" is a popular expression suggest-

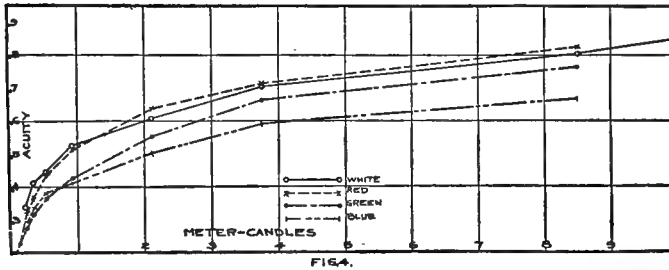

FIG4.

CURVES SHOWING VISUAL ACUITY WITH LIGHTS OF DIFFERENT COLORS. These curves are taken from an important study of "Visual Acuity with Lights of Different Colors and Intensities," by Dr. D. Edgar Rice, of the Department of Science and Technology of Pratt Institute. Dr. Rice remarks, "As to the effect of different colors upon acuity it is quite clear that whatever differences exist are in favor of the colors at the red end of the spectrum. . . . The red and the white illuminations yield approximately equal acuity, while both are considerably higher than the green. The acuity with the blue illumination is the lowest."

ing this relation. This is more than a question of imagination and sentiment. It is a demonstrable physiological and psychological fact that the red end is dynamogenic in its influence, that is, that it increases and reinforces activities going on in the system, while the blue end inhibits. The accompanying diagram gives a set of curves showing the relative legibility of type under the same

intensity of illumination by different colors. Colors, then, if used discreetly or harmoniously, attract the eye, and, what is equally important, hold it. We do not tire of agreeable color combinations. We revel in them, contemplate them again and again, look for them on other occasions and point them out to our friends. But the colors must be properly employed or they may not only fail to hold the eye, but may actually repel it.

A significant fact is that of preferred colors. Elaborate statistical studies on men and women students in New York, Minnesota, and England disclose certain interesting differences in color preference. There is, of course, a considerable range of individual differences, and the results would be greatly modified by changes in the use to which the color might be put. Comparison of the different investigations is so interesting that I give here a summary, prepared by one of my students, of the principal results of several of them.

1. Grant Allen studied the color preferences shown by savages, securing the assistance of missionaries in various lands. He gives the following order as the result of these inquiries:

1. Red
2. Yellow
3. Orange
4. Blue
5. Green

2. Baldwin studied the color preferences shown by a young baby, on the basis of the color reached for when variously colored papers were placed before it. He gives the following order of preferences:

    1. Red
    2. Blue
    3. White
    4. Green
    5. Brown

3. Winch investigated color preferences of 2,000 school children in London, with the following order resulting, for both boys and girls:

    1. Blue
    2. Red
    3. Yellow, falling lower with increased age and intelligence
    4. Green, rising higher with increased age and intelligence

5. White
6. Black

4. Gordon, with only a few subjects, studied the influence of background, securing the following orders:

On Black	*On White*
1. Red	1. Blue
2. Yellow	2. Red
3. Green	3. Green
4. Blue	4. Yellow

5. Studies of students in Vassar College yield the following order of preference:

1. Blue
2. Red
3. Green
4. Yellow and Orange

6. Wissler, from his study of Columbia men and women students, deduces the following table. His results show that yellow was preferred more by the younger students than by the older. With age, he concludes, the preferred color passes on down toward the violet end of the spectrum. Combining this result with those shown in his table, we might conclude that, in so far as

the data are reliable, the younger the person the nearer the red end of the spectrum would be his or her favorite color, and also that children and women would prefer reds, while men and older women would show greater fondness for blues.

TABLE VI

(*Wissler's Table*)

Color	Percentage of Men Who Like It	Percentage of Men Who Dislike It	Percentage of Women Who Like It	Percentage of Women Who Dislike It
Red.....	22	7	42	8
Orange....	5	25	8	31
Yellow....	2	32	5	8
Green.....	7	15	9	21
Blue.....	42	12	9	23
Violet.....	19	8	19	9
White.....	3	1	8	0

Taking these studies as a group, the following points are to be noted. The reds and blues stand high for educated people, the orange and yellow standing low. For children and savages just the reverse is the case. Yellow falls in the development of the race and also in the development of the individual. No very striking sex differences for order are shown, but the figures show considerable differences for amount. It is a further

general principle that the most saturated colors are preferred.

Besides the strong attention value of colors, there are certain other advantages in its use which might as well be briefly enumerated while we are on the topic.

1. The use of color enables the adequate representation of the texture, quality, fabric, grain, pattern and hue of the article with less strain on the imagination.

2. It conveys a precise idea—yellow as a word may mean anything between red and blue, innumerable shades and tints of orange, yellow and yellowish green.

3. It enables the recognition of packages and articles much better than does a simple name or trade mark. The National Biscuit Company packages are good illustrations of this fact.

The value of color is illustrated by comparative tests carried on by mail-order houses in Chicago. These tests show that a cut in color often sells as high as 15 times as much as does a plain black and white cut of the same article. These houses are using more and more color in their catalogues in spite of the extra cost.

Another important fact about color which also greatly enhances its attention value is that a sign

or color scheme which is really flat may be made to look solid, to have depth, to be extended in three dimensions instead of two, by the proper use of color.

Color and third dimension.—The third dimension can be suggested without the aid of perspective drawing, by simple color quality differences, in two ways.

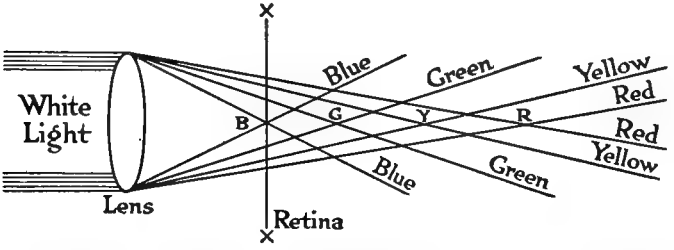
1. By appropriate selection of brightness values. Brightness is easily taken to mean nearness, while relative dullness suggests distance. When, in the laboratory, the illumination of objects is increased or diminished, observers frequently suppose the object to be approaching or receding, although it has remained stationary throughout.

2. But the most important, practical and striking result is that secured by a proper selection of differences in hues. The red, warm end of the spectrum seems closer to us than the blue end when both really are located at the same distance. In fact, the spectral series shows an increasing suggestion of distance as we go from red and orange through yellow and green to blue and violet.

The ether waves causing the different colors are refracted by the eye in different degrees. Red

is bent least of all, yellow a little more, green still more, and blue most of all. This is the reason that a prism can break up a beam of white light into the colors of the rainbow. The waves producing the different hues emerge from the prism at different angles, so that the separate colors can be thrown upon a screen or upon the retina in the form known as the spectrum.

The following figure represents this fact:



CHROMATIC ABERRATION IN THE HUMAN EYE. By way of explaining why blue and green objects seem farther away than do red and yellow objects. This principle can be used to advantage in constructing electric signs. Because of their apparent nearness the red and yellow lights stand out more prominently than the green and blue lights. (See text for explanation.)

Suppose, now, that the lens in the eye is adjusted so that the blue rays come to a focus on the retina at B and, therefore, give a clear image of the object from which they come. The red rays do not focus until R, which is some distance behind the retina. In order to get a clear picture of the red object, the lens must bulge out, becom-

ing more convex, hence bending each ray of light correspondingly more so that the red rays focus sooner than before, until, in fact, they meet at X on the retina.

But we also bulge out this lens in order to get a clear image of a near object when we have been looking at a more distant one. In this way bulging the lens comes to mean for us a near object. And when we bulge the lens for a clear image of the red rays we naturally infer their source to be nearer. And, since we flatten the lens both for a clear picture of a distant object and for a sharp image from the blue rays, we suppose the blue object to be far away; we confuse blueness with distance.

We shall later see the appropriateness of blue for mural decorations when the suggestion of distance is desirable. The value of this principle is demonstrated in many electric light signs on our streets, though the principle is often disregarded with the result that what should seem near seems distant and vice versa. We shall take up the topic of color more fully when we consider the factors which make for sustained attention, and shall there discuss the effectiveness of different color combinations. It is sufficient here to indicate the high initial attention value of color.

3. CUTS AND ILLUSTRATIONS

Closely related to the interest in colors is that in pictures. Pictures were the first means of written communication. The letters of our alphabet can be traced far back to their early pictorial sources. The pictorial impulse is a universal one and no art has been further developed than that of pictorial representation. The reasons for this strong interest are many. Chief among them is

ILLUSTRATION AS AN ATTENTION AND INTEREST DEVICE

the fact that pictures so often afford pleasing color combinations. Again, two of the things that provoke strongest interest are personality and action. Next to a human being nothing is fuller of personality than a picture—the personality of the

artist, of the subject represented, associations called up in the mind of the observer. Besides, the painter takes care to choose for his subject a

THE USE OF ILLUSTRATION

theme that has an intrinsic interest. Experiments show this pictorial interest to be stronger with women and children than men. As the race has progressed, its means of communication have developed in abstract directions, quite beyond the

pictorial stage. Men who have been most active in this process seem to have lost somewhat of their earlier pictorial interest.

However, experiments go to show that there are two quite distinct classes of people in this respect, an unimaginative or imageless class, who require pictures for comprehension of statements in the copy, and another class who do not. Thus in a study by the writer of a group of expert engineers with respect to the persuasiveness of different sorts of machinery advertisements, the men broke into two sharply defined groups. Members of one group seemed to think in terms of visual pictures. They did not need an illustration of the machine, for the words themselves called up vivid mental pictures of the parts and the advantages described. To these men the presence of a cut was not necessary—they wanted all the text they could get and placed copy advertisements higher than advertisements with illustrations. But for the men in the other group the words called up no mental pictures. They seemed to think in terms of sounds and movements and had to have a complete cut of the machine before them before they could perfectly comprehend its advantages. For such men advertisements with clear cuts were more persuasive than those with

only reading matter. See Chapter I for Table of these results.

A study by Strong of thirty women in my own laboratory showed the same two groups. This was a study of the persuasiveness of ten advertisements for a given brand of soap. In the following table the two groups are designated as Group A and Group B. The figures with the (+) or (—) indicate whether and how much these advertisements were placed above (+) or below (—) the average by the members of the two groups. The pictures represented various combinations of cuts and reading matter, and it will be seen that one group (B) consistently places cuts higher than the average, and text lower, while the other group (A) just reverses this relation, placing text higher.

TABLE VII

Groups	Character and Content of the Appeals.									
	1 All cut	2 All text	3 ½ cut	4 ¾ text	5 ½ cut	6 ½ text	7 ¾ cut	8 ¾ text	9 ¾ cut	10 All text

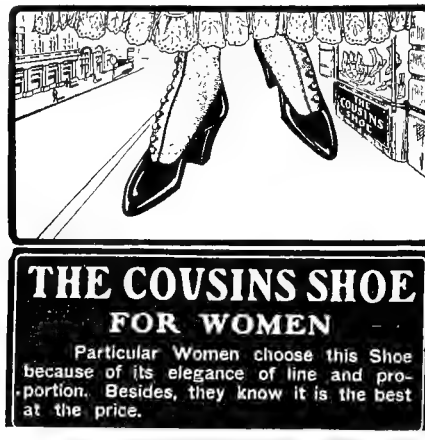
Group B places cut advertisements high..... +1.0
Group B places text advertisements low..... —0.8

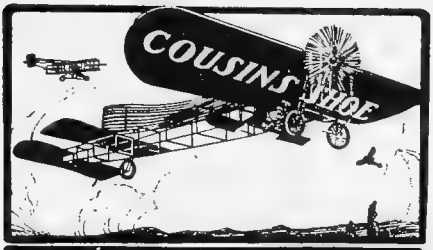
The inference is, then, that the ideal appeal should contain, other things being equal, both cut and reading matter. By this arrangement both the visual and auditory-motor types of imagination will be provided for.

Since illustrations are to be used, the question arises: What sort of a picture will be most effective? A strictly relevant cut, portraying the article itself and designed not merely to attract but to inform as well—such a cut, in fact, as the following? Or should the cut be simply a means of



A Strictly Relevant Illustration

catching the eye—a cut more or less unrelated to the article advertised—a pretty face, a funny scene, etc., such an irrelevant cut for example as the following?



THE COUSINS SHOE

FOR WOMEN

The High Plane of excellence in the Cousins Shoe is the logical result of Sixty Years of the most careful Shoemaking. The Cousins Shoe embodies the Perfect Blend of Style, Comfort, and Durability.

An Irrelevant Illustration

Remotely Relevant Illustration

And, since reading matter is also to be used, should it be a straightforward declaration of selling points—relevant copy?

IRRELEVANT ILLUSTRATION

Or can it be irrelevant, merely amusing, striking, or calculated to connect some special feeling with the article?

An interesting study of this question is re-

ported by Gale. These four kinds of material were exposed for brief intervals on five different occasions and record was made of the number of times each item was observed. The results are shown by a set of curves, which show the effect of repetition on relevant and irrelevant words and cuts so far as attention value is concerned.

The chief results may be summed up as follows:

I. With respect to attention value, the items stand in the following order:
   1. Relevant words
   2. Relevant and irrelevant cuts
   3. Irrelevant words

II. On five repetitions of the same appeals:
   1. Relevant words increase in value
   2. All cuts decrease in value
   3. Irrelevant words do not change

III. Women are more attracted by cuts and by irrelevancy than are men.

This pioneer study by Gale is a most suggestive piece of work, and its results should be checked and verified or tested by other investigations of the same kind. Such studies are now in progress in several laboratories.

4. SUGGESTED ACTIVITY

The fourth interest incentive grows out of the preceding one quite directly. It is what we may call *interest in suggested action.* Nothing is more interesting than a person, an animal, even a machine, in action. Much of the strength of window demonstrations, street vending, etc., depends on this fact. The *New York Herald* has no better advertisement than the sight of its presses, from the windows on Broadway. A barber stropping his razor, a gang of men unloading a piano, a mason using his trowel, a lather slapping in the nails, anywhere, even in politics and in the White House, the man in action attracts interest. This is not the same factor that we discerned under the head of movement. This is shown by the fact that pictures and representations of action have the same attractiveness as does the action itself. Pictures of people doing things possess an interest far greater than any representation of inert objects or the most vivid word pictures. Note the effectiveness of suggested activity as shown in the quarter-page Graphite advertisement in Chapter V.

A very curious and important fact in this connection is that to suggest action pictorially, the

moving object must always be caught at a resting point, otherwise it suggests not action but arrest. The mistake is repeatedly made of supposing that to suggest motion, let us say of a horse trotting, the animal should be represented in the middle of its step. Nothing is further from the truth. To suggest action effectively the foot should be caught at one of two resting points, either at the initial point, before beginning the movement, or at the final point, midway between extension and return. To show it in the middle of its course suggests only pose, and stilted pose at that. Consequently walking is best represented not by a man with one foot in the air, but by one with both feet on the ground, one just having completed its swing, the other just about to begin. A man striking a blow with his fist should be represented either with an arm drawn back ready to strike or with an arm extended, the blow having been already launched, but never with it in a halfway position. Newspaper photographers are the most grievous blunderers in this respect by failing to press the button at the psychological moment. The accompanying illustrations clearly represent the truth of this principle. Compare the inertness, stiffness and lack of attractiveness in Group I with the animation and interest of Group II.

It was thought that the introduction of moving pictures and kinematograph photography would be of great service to the painter and sculptor in

VIOLATING THE LAW OF THE RESTING POINT. Suggestion of Pose rather than of Activity.

catching their living subjects in the process of quick action, preserving this attitude for reproduction with brush and chisel. But it was found that the expectation was all a false hope. No attitude represented action so vigorously as the

resting points with which we were already familiar. The reason for this rather surprising circumstance is probably to be found, in part, in

THESE MOVE! DO THEY NOT?

ILLUSTRATING THE LAW OF THE RESTING POINT. Strong Suggestion of Activity.

the fact that the eye cannot perceive while it is itself in motion. Look into a mirror at your own eye, meanwhile moving the eye about. You will find yourself unable to observe the movements of your own eye. For in the moment in which the

movement is taking place, the external stimulus does not have time to set up any definite images on the constantly shifting retina. So it comes that, just because we do not see the intermediate positions except when the limb is deliberately held there fixed, we do not associate them with the movement, but always the two extremes that we do see.

Observe the mental picture called up in your mind's eye when you read the words "a panther leaping." You will see the meaning is visualized either by the picture of a panther preparing to spring, or by that of a panther just alighted—probably never by the picture of a panther in the progress of the leap. Or if this should happen, you will find that the panther is at that resting point immediately between springing and landing—the point between ascent and descent, when the animal hangs poised for a moment. So a successful picture of a man leaping a fence must catch him at one of the three resting points, the moment of springing, the moment of alighting, or the moment of suspension at the height of the leap when he seems poised just above the fence.

How, then, can we represent action when there is no resting point to be caught? There are per-

haps two chief types of cases in which this might be desirable: the case of a swiftly moving vehicle, and that of vibrating pieces of machinery. Here we clearly have a different proposition. We are dealing with inanimate objects, with mechanically produced and uniform motion. The law of association which we invoked to explain *the principle of the resting point* must also come to our assistance here. All we can do is to portray the retinal picture which the eye gets when looking at such a moving object—blurred spokes in the wheels, streaming ribbons and banners, blurred visions of oscillating levers, or what not. The law is always to put there just what the eye could really see and no more. Too much interpretation and assistance on the part of the artist defeats its own purpose.

5. THE COMIC

The use of *the comic element* as an attention incentive in business is, to say the least, precarious, and will be successful only in the most skillful hands. We may discuss this factor under three headings:

A. It must be pointed out first that the comic, while it attracts and sustains attention, draws this attention quite unto itself. The comic pictures

occupying the Boston Rubber Company's advertisements attract only incidental attention to the commodity announced, and the reader remembers the picture but not the brand of goods. Repeated laboratory tests have shown this to be true.

B. As will be developed later, a statement of *selling points* is perhaps the very best direction which an appeal can take. Selling points are serious propositions, and so is the effective distribution of goods. But the introduction of levity, which usually tends toward the ridiculous in advertising copy, seems like an attempt to slur over and evade a discussion of the pertinent points at issue and to keep attention from them in favor of irrelevant material. The weakness of irrelevant matter we have already had occasion to point out.

C. One especially important characteristic of the comic is the fact that we soon become adapted to it. Jokes and funny pictures rapidly become "chestnuts" and stale. But if the comic appeal is to be employed, it is worth while knowing that the different sorts of the comic do not grow stale with equal rapidity. Reports of a prolonged experiment on the effect of repetition on the comic and on the individual differences in reaction to comic situations have already been published by the author. The full discussion can be found in the

Psychological Review for 1911. We may divide the comic into two main types.

The rule in football is "Hit the line hard" and 'twas ours in ordering our clothing for fall. We hit the line hard and selected the finest and largest assortment of men's styles we have ever handled. It is a line that you and every man will enjoy looking through and wearing.

From $15. durability to $35. luxury, whatever quality you select you'll get the full worth of your money

To-day our special is (describe and price).

THE OBJECTIVE COMIC. The Calamity.

1. The *objective,* in which the source of amusement is the fact that some other person is involved in a predicament, is subordinated, disap-

pointed, deceived, tricked, duped or bantered, either by a third person or by natural forces,

"There ain't no such animal."

"In circus announcements we expect the unexpected—but the store that exaggerates in its advertisements is simply signalling to the sheriff."—Hubbell.

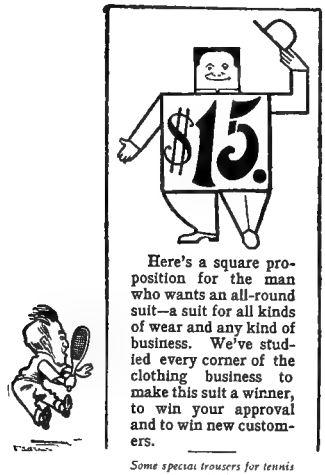
Our advertisements are so short, we're freed from the temptation of exaggeration.

Here's a suit at $15. and an overcoat at $18. where every cent of the cost has been expended to give the customers utmost values, at the prices.

THE OBJECTIVE COMIC. The Naïve.

without serious consequences. Under such circumstances we tend to be amused. The calamity joke, the naïve or unconscious joke, would be examples of this group.

The second group, the *subjective comic,* comprises those situations in which the laugh is caused by the fact that we ourselves are tricked, surprised, discomfited mildly, disappointed, in



THE SUBJECTIVE COMIC. Play on Words.

expecting one thing, one event, one use of a word, and getting instead an unexpected one. Examples would be the pun, play on words, the sharp retort, the dialect joke, wit, etc.

Now the characteristic of the *objective comic* is that it loses its flavor rather slowly—it often waxes, increasing in funniness with repetition. The *subjective comic,* on the other hand, becomes

stale with great rapidity. When a series of comic appeals, containing examples of both classes, is arranged in an order of funniness in successive

"Signs of an early spring."

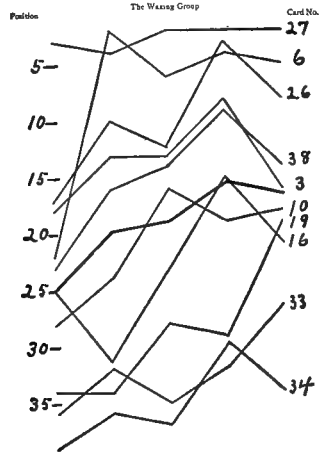
trials a week apart, the objective jokes rise in relative value, thus constituting a *waxing* class. The subjective appeals fall in value, thus comprising a *waning* class. Jokes which contain both ele-

ments remain on a level. The reader is referred to the original article for further details. But the importance of this waxing and waning law, in selecting comic appeals to be repeatedly seen in an advertisement, is clear from what already has been said.

6, 7, 8. FEELING TONE, INSTINCT AND HABIT

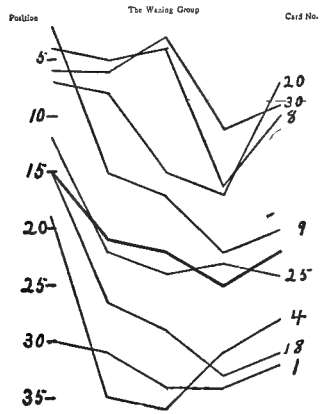
There remain yet to be considered the interest incentives, of *feeling tone, instinctive re-*



SHOWING THE INFLUENCE OF FIVE REPETITIONS ON OBJECTIVELY COMIC APPEALS. The Relative Value Increases

sponse and effective conception. While it is true that these three appeals have a strong initial at-

tention value, their greatest service lies in holding the attention already attracted by some other device, or in reinforcing the response which this appeal invited. Hence we shall treat *feeling tone*



SHOWING THE INFLUENCE OF FIVE REPETITIONS ON SUBJECTIVELY COMIC APPEALS. The Relative Value Decreases

under the heading of the second task, and *instinct* and *effective conception* under the fourth task of an advertisement. But, when we come to discuss their value as "sustainers" of attention, it must be remembered that all that is said of them there applies equally well to their operation as initial appeals.

CHAPTER VII

AN EXPERIMENTAL TEST OF THE RELATIVE ATTENTION AND MEMORY VALUE OF THE MECHANICAL AND THE INTEREST DEVICES

In order to test the relative value of the *interest incentives* as compared with that of the *mechanical devices,* an interesting experiment was performed with the aid of a group of six advertising men, selected from a class which had been following a course of study based on the material presented in this book. These men were made familiar, through lectures and demonstrations, with the characteristics of the two groups of incentives. They were then given the 77 full-page advertisements found in an issue of *Everybody's Magazine,* and asked to indicate, in the case of each advertisement, the chief three incentives relied on to attract and hold attention. When less than three devices were found, the indication included only such devices as were clearly discernible. Three psychologists made similar determinations of these advertisements. The total number of votes, for the two classes of incentives, was computed for each advertisement, thus affording

a fairly reliable measure of the "character" of each.

Meanwhile Dr. E. K. Strong tested the attention and memory value of each of these advertisements, as shown by the ability of 137 women to recognize them as having been previously seen in a copy of the magazine which they had had in their possession for one week, with instructions to read a certain article therein, in connection with their regular class work in college. None of these women knew that they were going to be in any way tested for their memory of the advertisements, nor, indeed, in any other way.

We have, then, the judgments of six advertising men and three psychologists on the type of incentive most prominent in each of the appeals, and these judgments are shown in the following table. We have also a measurement of the attention and memory value of each of these advertisements, as secured from the records of the 137 women readers. The following table gives these values, also. The table gives the results for the 10 best advertisements (remembered by the greatest number of readers) and for the 10 poorest (remembered by the fewest readers), exclusive of the six advertisements which appeared in preferred position (cover pages and next to reading

matter). The "incentives" column gives the number of votes for each of the two types of devices.

TABLE VIII

The Ten Best Remembered

Page	Firm or Commodity Name	Number of Mechanical Incentives Reported	Number of Interest Incentives Reported	Per Cent. of 137 people who remembered
128	Ivory Soap	6	16	8.2
6	Cosmopolitan	1	15	8.0
29	Barbara Worth	1	6	8.0
117	Gillette Razor	8	9	7.2
37	Post Toasties	8	15	7.1
36	Campbell Soup	6	17	7.1
96	Jap-a-Lac	5	15	6.8
66	Western Electric	2	21	6.6
57	Baldwin Piano	1	18	6.3
60	Mallory Hats	3	18	6.3
	Averages	4.1	15	7.2

Percentage Interest Incentives, 78.5.

The Ten Least Remembered

62	Overland Auto	9	4	1.2
55	Genasco	3	13	0.9
64	Wilcox Trucks	6	12	0.9
63	Overland Auto	9	4	0.7
96	Dahlstrom	2	1	0.6
48	Underfeed	3	1	0.2
53	J. M. Asbestos	9	9	0.2
30	Lord and Thomas	4	3	0.2
44	Keystone Watch	3	5	0.0
52	Congoleum	5	5	0.0
	Averages	5.3	5.7	0.5

Percentage Interest Incentives, 51.8.

Two things are clearly indicated by the table. In the first place, those appeals which were remembered by few of the readers are the ones which utilize few definite incentives of any kind. They are the ones on which fewest votes were cast for any incentives whatsoever—they were doubtless constructed by "inspiration," without any conscious or formulated plan in mind, and they well-nigh defy analysis, either by the advertising men or by the psychologists. This is in itself a lesson worth learning.

But the second point is the one in which we are most interested in this connection. In the case of the advertisements best remembered, 78.5 per cent. of the votes were for interest incentives. These advertisements, relying for the most part on the interest devices (picture, novelty, color, feeling tone, the comic, suggested activity, instinctive reaction, and habit), are remembered by 7.2 per cent. of the 137 people, that is to say, they were remembered over 14 times as often as were those relying on mechanical devices.

In the case of these latter advertisements, the average amount of mechanical incentive (5.3) is even a little more than in the case of those of the first group. The only considerable change is in the degree to which interest incentives are relied

on. Here we find only 51.8 per cent. of the votes given to interest incentives, as contrasted with the 78.5 per cent. in the case of the better group. And, indeed, even this fairly high per cent. is almost entirely due to two of the appeals.

Taking the appeals one by one, in the case of the 10 best remembered ones, without exception, the interest incentives predominate. In the case of the 10 least remembered, in 7 cases out of the 10 the mechanical incentives either equal or exceed the interest incentives, leaving only 3 in which the reverse is the case.

The superiority of the interest incentives, for purposes of attention and memory, for which we have contended throughout this discussion, is most thoroughly confirmed by the results of this experiment, as well as by the returns from advertisements actually run.

CHAPTER VIII

THE SECOND TASK: HOLDING THE ATTENTION

Let us assume, now, that, through the application of some principle in the foregoing chapters, an appeal has been formed so as to attract initial attention. The final effectiveness of the appeal will depend on whether or not this attention can be *held* long enough for the suggestion or the argument to take its place in consciousness along with other appeals and to modify the later responses of the reader. This is the point at which the persuasiveness of the appeal first begins to make itself felt. Persuasion is simply the act of *holding the favorable attention* long enough for the stimulus to enter into effective combination with other processes in consciousness. Such combination leads to the response. What the response is will be determined partly by the needs, resources and general purposes of the reader. But it depends also largely upon the character of the appeal, for this appeal may be potent enough

to create his needs, suggest resources, and modify his general purposes.

We have already seen that *attention always fluctuates* or comes in pulses. The appeal then cannot operate by simply prolonging the first moment of attention. It must be so constructed that after this first moment the eye does not move to another thing, but fixates again and again the original object, that is to say, the reader must be able to see some new phase or aspect in the original appeal. Figure 1 (page 134) is able to hold attention, but it does so by appearing to change its character. Now it is seen as a stairway leading upward, now it is a stairway upside down, now a set of steps seen from below, now from above, etc. As fast as attention to one aspect wanes another aspect suggests itself. The same is true of figures 2 and 3. Watch a passenger reading the Subway advertisements. You will see at once that he hurries by some cards and lingers over others. Or compare your own interest in the following advertisements. The first is too simple, the second is too complex and choppy, while the third is in some way so constructed that you look at it again and again; it holds your attention. What then are the requisites for sustained attention?

Here again we may point out two groups of factors, a group of mechanical devices and a group of interest devices.

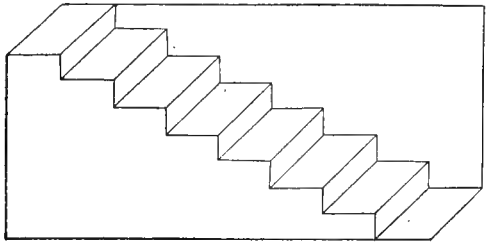


FIGURE 1

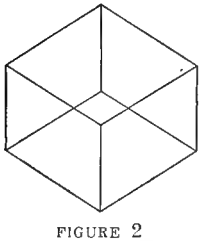

FIGURE 2

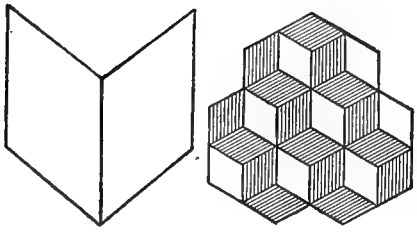

FIGURE 3

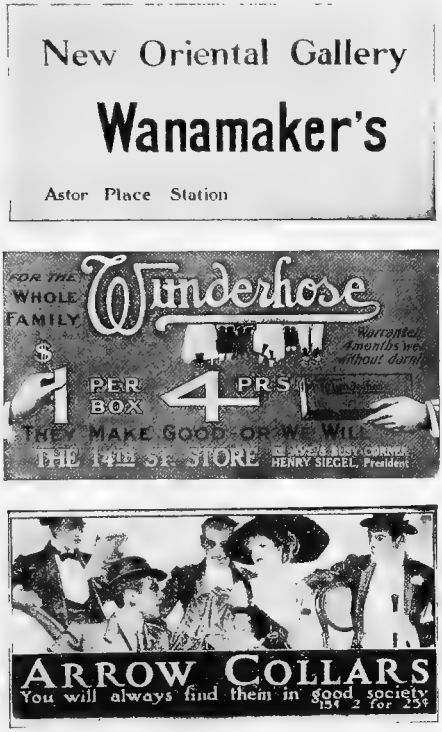
FIGURES APPEARING TO CHANGE CHARACTER

I. MECHANICAL HELPS

1. *Complexity.*—Unless the advertisement is intended to be a mere reminder, a mere suggestion



CARDS FROM NEW YORK SUBWAY

of some other appeal previously seen, a certain amount of complexity is requisite. The advertisement should contain shifting points so that,

while attention must fluctuate, it can flit from point to point, aspect to aspect, of the same space. Perhaps three elements or units, three facts, styles, etc., represent the ideal; three arguments or propositions of interest, three figures if the advertisement takes the form of picture, three styles or sizes of type, three color masses, etc.

SECURING UNITY THROUGH STRUCTURE

This allows one object for the focus, one for the field, and one for the margin, and, if the elements are properly unified, prevents the encroachment of parts of some foreign unit into consciousness.

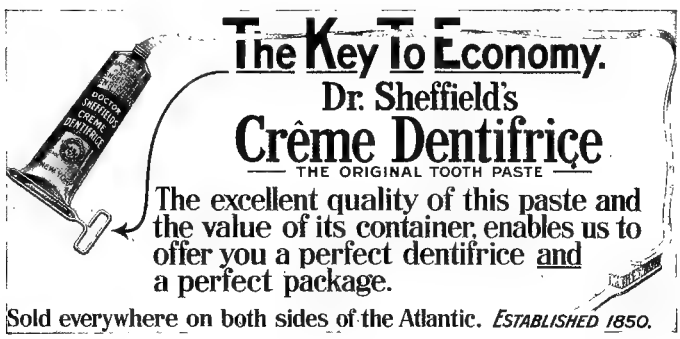
2. *Unity.*—The second mechanical factor then is that of *unity.* Not only must there be complexity, but the elements should be so interrelated as to form a whole, so related that the shift from one to the other is perfectly natural. There are

various ways in which this unity can be accomplished.

(a) *Structure.*—The elements may all participate in a general design or composition, as do the figures in the Arrow Collar card. By the direction in which the faces are turned, by some common act in which all are engaged, etc., attention may be led from point to point in the total composition, and always returned, in the long run, to the salient points or center of the arrangement. Notice how all the lines and all the faces of all the figures are turned in the direction of the man with the collar in the Arrow collar card. The Sistine Madonna is the classical example of such an arrangement. Aside from these devices of composition, the *content* of the parts may all assist in the formation of a unit. Thus a question may lead naturally to an answer which follows or is to be found in another part of the composition.

(b) *The use of pointers, curves, arrows, borders and similar lines* may also be used to the same end. The *border* gives an artificial unity to the contents bounded by it. It tends to keep the eye within the given area, since the eye reflexly tends to follow lines rather than to leap across them. Just as the pasture fence keeps the cattle wandering about the enclosure instead of

breaking out of it, so the *border,* the *curve,* the *pointer,* keep the restless eye from straying to foreign quarters by turning it ever back toward the center of the composition. Moreover these borders, frames and lines of demarcation may be



AN ATTEMPT TO SECURE UNITY BY MECHANICAL MEANS (Lines)

themselves artistically designed and so possess positive attention value which may reinforce that of the content of the space which they embrace. The simple law that the eye tends to move *along* lines instead of across them is worth bearing in mind.

II. INTEREST DEVICES

The mechanical devices for sustaining attention should not be disregarded, but their importance is insignificant as compared with what we may call the *feeling tone* of the appeal itself. By *feel-*

ing tone we mean the *pleasantness* or *unpleasantness* which accompanies our perception of objects. Every object in our experience has a twofold character. It is at once an object of *cognition* and an object of *feeling*.

From the point of view of cognition it is this or that object, has this or that use, is made of this or that material, and so on. From the other point of view it is not only this or that kind of object, but it also makes us feel agreeable or disagreeable, comfortable or uncomfortable in its presence. It makes us feel either desire or aversion, it either attracts or repels. Experiments show that we not only *feel* at the same time that we *perceive*, but that we also make characteristic movements toward the object.

The *feeling of pleasantness* is accompanied by *expansive, open, appropriative* bodily attitudes, and by actual movements toward the agreeable stimulus. Under these conditions stimuli effect easy entrance to the higher levels, make strong impressions and are long remembered. The *pleasant impression tends to persist* in consciousness, long after the original stimulus has been removed.

The *feeling of unpleasantness*, on the contrary, is accompanied by *retractile, conflicting or evasive* movements, the organism tends to shrink

away from the stimulus rather than to move towards it. Under these conditions the resistance of the nervous pathways is increased, stimuli make relatively faint impression, and this impression tends easily to oblivisce or be forgotten. Along with the law of persistence of the pleasant goes that of *the obliviscence of the disagreeable.*[1] The importance of the feeling tone of an appeal ought, then, to be very apparent. The feeling tone of an advertisement, as of any other object, will influence not only the amount of attention it receives but its persistence in consciousness as well, and it follows that the reaction to the appeal will also involve the article in the interest of which the appeal is made.

The feeling tone of an appeal may depend on two principal factors:

I. On its form or arrangement, its character as a work of art, its general beauty. Symmetry, proportion, clearness, balance, the quality of lines, spaces, masses, colors, harmonies, atmosphere, all play their rôle here, all of those elements and laws of design which a course on the "Principles of Arrangement" would treat.

II. The feeling tone will depend not only on the

[1] See the article on this subject, by the writer, in the *Journal of Philosophy, Psychology and Scientific Methods,* Dec. 22, 1910.

form of the appeal but on its content as well. Words have their feeling tone just as do lines and color. Besides, certain objects, ideas, topics, people, purposes, characteristics, arguments, associations, etc., have the power to arouse strong agreeable feeling on the part of the reader while others are intrinsically repulsive.

CHAPTER IX

FEELING TONE OF FORM

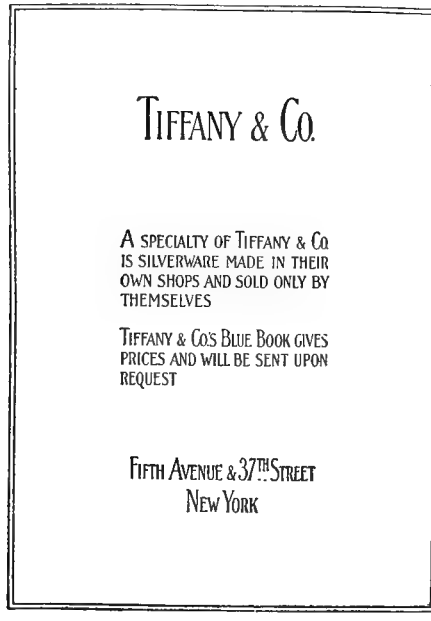
These factors I shall discuss under the headings of the various elements of design—lines, form, relations, masses, colors, harmonies, etc.

LINES

Mathematically, lines are lacking in quality as they are in width, but psychologically, even the simplest line, as it appears in sketching, has both feeling tone and symbolic significance. This feeling tone of lines can be utilized to advantage in representing advertised articles by both relevant and irrelevant cuts, and should also be considered in the appropriate selection of type faces. The feeling tone of a line depends upon three chief factors: (1) its quality; (2) its direction; (3) its character, as straight or curved.

Quality.—The factors constituting the quality of a line are: (1) breadth; (2) intensity; (3) texture; (4) color. By these we mean: (1)

whether the line is wide or narrow; (2) dark or light; (3) rough or smooth; (4) its hue.



THE FINE BLACK LINE, SUGGESTING PRECISION AND HARDNESS

Speaking generally, the following principles hold:

The fine gray line suggests delicacy of texture.

The fine black line suggests precision and hardness.

The broad rough line suggests homeliness and solidity.

The proper selection of lines in cuts or copy is of great utility in showing the texture of the article, or in lending atmosphere either to the cut, the object, or the appeal as a whole.

THE BROAD BLACK LINE, SUGGESTING SOLIDITY AND WEIGHT

Direction.—1. Verticals.—The moderate use of vertical lines conveys a suggestion of simplicity, firmness and dignity, with a certain severe grace. Excess of verticals, however, is likely to give stiffness and rigid formality.

There are two psychological reasons for this effect of verticals:

(a) The feeling tone of all spatial elements, as of many spatial arrangements, depends on imitative tendencies to movement or attitude which they provoke on the part of the observer. The instinctive response to a vertical line consists in straightening out the body, assuming an erect position. This is the position we assume in moments of formality, sternness, attention, dress

ILLUSTRATING APPROPRIATE USE OF HORIZONTAL LINES

parade, etc., and hence at once suggests to us the emotions accompanying these movements.

(b) Ideal literary and architectural associations of towers, monuments, columns, warriors, etc., with their erect, proud direction, have come to make the vertical symbolic of "uprightness," moral strength, and this symbolism still attaches itself to such a line, even when it is in no sense a part of the object with which the original association was made.

2. Horizontals.—The movement from side to

side is the movement which the eye can execute with the least effort. So much is this true that we overestimate the length of verticals as compared with equal horizontals, since the former require so much effort for the eye to sweep along them from end to end. Side to side movements are frequent, as in sweeping the horizon, reading, looking at an audience, etc. Their very frequency

Illustrating Inappropriate Use of Diagonal Lines

is probably the chief reason for their relatively greater ease. Hence the horizontal is the line of ease, quiescence and repose, almost of languor, "the suggestion of lying down and the consequent suggestion of quiet and relaxation being particularly strong."

As is well known, the headpiece of the Roman cross must be actually shorter if it is to appear equal to the arm pieces. The extra effort involved in running the eye along the vertical head piece makes that line seem equal in length to the

actually longer but more easily perceived horizontal arm.

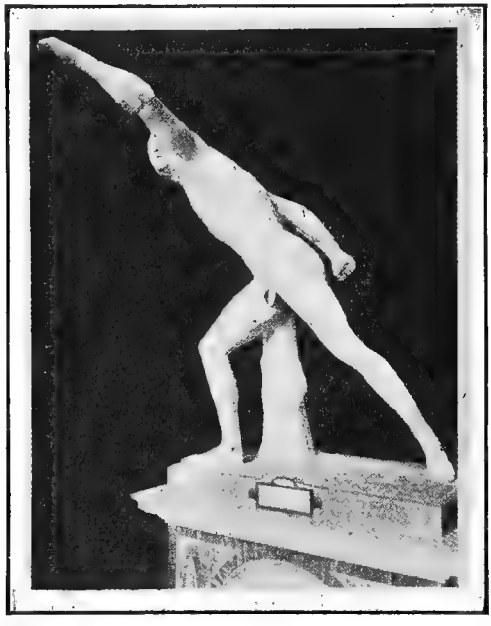
3. Diagonals.—The diagonal line seems to the observer to be full of action and movement. The psychological reasons for its possession of this character are:

(a) The fact that our bodies when engaged in tense action of effort or movement are thrown into such oblique lines in order to counterbalance load or resistance. Hence, when we see these diagonals, we associate the direction with the oblique lines which we observe when human beings are active.

(b) The diagonal sets up imitative movements on the part of the observer. We tend to throw our own body in a direction corresponding to that of the line, and these movements at once call up the feelings of strain and activity associated with them under other circumstances. The "Gladiator Combatant" in the Louvre and the diagonal of the three figures running, suggests this rush and speed of the oblique line generally. So does St. Gaudens' bas-relief on Boston Commons, and the Winged Victory fragment.

4. Curves.—Generally speaking, curves are more pleasing than straight lines, whether the curve be arc, serpentine, loop, spiral or what not. The

reason for this preference for curves is not very clear. The old theory that the most natural and agreeable eye movement was such as would be



FEELING TONE FROM DIRECTION OF LINES

made in following the preferred curves has been shown to be false. The eye, even in following curves, exerts jerky and irregular movements, which when traced or photographed do not at all make æsthetic lines. The most probable explanation is that offered by Gordon that "the curve

suggests smooth and easy movement in other parts of the body. We are able to move hand, wrists, head and feet, at least in serpentine lines and to experience the greatest ease and pleasure as well as the greater economy and power of these movements. It seems fair to assume that the memory of these movements, and perhaps some actual half-conscious movements like them, may be the basis of our æsthetic appreciation of the serpentine line."

At any rate, curves, whether they occur in copy, cut or decorative design, avoid the hardness and stiffness likely to be produced by straight lines, giving an atmosphere of grace, pliability, richness and voluptuousness.

CLOSED FORMS

Geometrical forms, as well as lines, have their own individual feeling tone due (1) to the character of their boundary lines and (2) to the character of the enclosed space. The chief source of these qualities seems again to be imitative movements or memories on our own part.

1. *The triangle* with its diagonal lines and sharp corners is lively, incisive and delicately balanced. Especially if it be not resting on its base, it is strongly suggestive of spirit, life and con-

stant motion. The stars themselves are not really five-pointed, but nothing represents their twinkling better than a combination of triangles. Triangles would form an appropriate border for advertisements of sparkling water, wine, lively music, light, etc. An isosceles triangle resting on its base is a perfect example of balance that is not dead but quite alive and active.

2. *The square,* composed as it is of vertical and horizontal lines, unites at once the stiffness and firmness of the former with the ease and repose of the latter, hence suggests solidity and strength, sturdiness. This is true so long as the square remains on one of its sides. The moment it stands on one corner it resolves itself into triangles and conveys the corresponding impression of delicate balance and liveliness.

3. *The Oblong.*—These forms vary so much in proportion and magnitude that it is difficult to assign them as a class any common emotional quality. But one interesting and important feature about them is the fact of rather decided preference for certain proportions. Nearly a hundred years ago Zeising argued for the "golden section" as the most beautiful of all proportions. By the "golden section" is meant a division of a whole into two parts, in such a relation that the

size of the whole is to the size of the larger part as that part is to the smaller (a + b : a : : a : b), or, roughly, a ratio between the two parts of 3 : 5. The law was supposed to hold for the division of lines and rectangles, dimensions of rectangles, ellipses, and other geometrical forms, as well as for concrete objects of art and industry, rooms, blocks, playing cards, windows, doors, fountains, books, writing paper, etc.

In order to be most pleasing, the dimensions of these objects must conform to the 3 : 5 ratio. There has since been considerable experimental evidence for this preference, and the measurement of many forms which are pleasing will be found to conform to it. Advertisements should utilize all possible chances of pleasing the eye. The division of the advertisement into cut and copy, the size of the card or space, the shape of trade marks, etc., could all utilize the principle, and doubtless with good effect. But it should be remarked here that the apparent proportion of a closed space form is often modified by the influence of adjacent elements and figures and the rôle which the form plays in the design as a whole. So much for the lines and forms. Let us now turn to the matter of relations, or to what are called the principles of design.

PRINCIPLES OF DESIGN

The general laws of arrangement will be found fully analyzed in text books on design and decoration, and somewhat more briefly in the text books on æsthetics, but it seems worth while to sum up a few of these principles in the present connection. So far as we shall do this, the matter will fall under the three heads of rhythm, balance and stability.

1. *Rhythm* is an important element in agreeable decoration, such as borders, etc. The basis of rhythm lies in the motor response, of an imitative kind, which the observer makes. The body is a rhythmical machine, and repetitions that fall in with organic rhythm easily fall into rhythmical groupings in perception.

Rhythm consists of some kind of repetition, but this repetition need not be literal nor complete. The essential thing about rhythm in spatial design is that the *direction of the movement* be (1) definite and (2) clearly indicated.

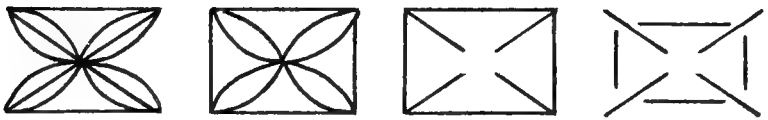
A

does not produce a rhythmical effect, but—

B

does, since it reads clearly from left to right. The single element gives direction, and the design as a whole is but a repetition of this motive. In A the movement may be either left-right or right-left, hence A cannot be called a rhythmical design. But there may be subdivision of the element, so that some larger section of the design serves as the motive.

Thus in



there is repetition more or less complete, but only the group of four elements suggests direction, hence the group would be the element of rhythm. This is also true in the case of D.

D

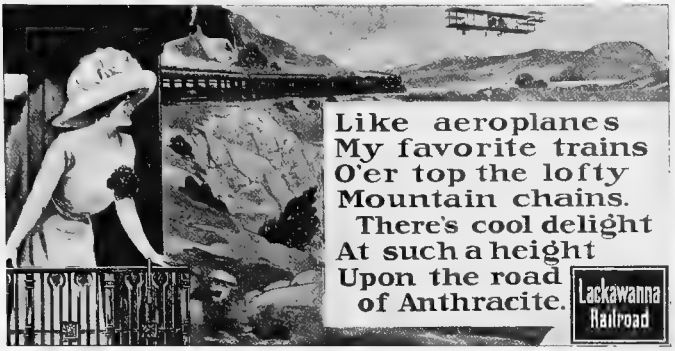
2. *Balance in Design.*—Just as balance is necessary in color arrangement, so it is an essential

factor in spatial arrangement. The human body is bilaterally symmetrical, and designs which set up bi-symmetrical movements of examination, response or imitation fit in most agreeably with the organic habit and structure. The most perfect balance would be what we call bilateral symmetry. In such compositions each half is a perfect copy of the other except for direction. Only in very formal compositions can this condition be conformed to. In actual representative painting, in type arrangement and illustrations by cuts, some deviation is of course required.

So for practical purposes we usually have to resort to what Puffer calls "substitutional symmetry." According to the principles of "substitutional symmetry" there are four items of "weight" in composition, and these four items may be made to balance each other in various combinations. The items are:

1. Mass.
2. Depth or vista.
3. Direction (of line or motion or attention).
4. Interest.

Says Gordon: "In good pictures one will probably find an equation in which two of these items are set over against the other two, unless



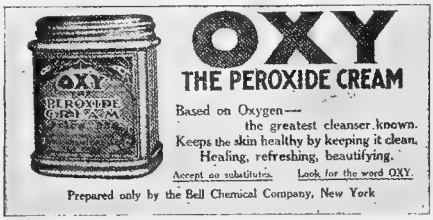
BALANCE OF MASS AGAINST VISTA (Distance)

it happens that one item is extraordinarily stronger, and in this case it will be balanced by the other three. In a portrait, for instance, if the mass of the person's form is on one side of the

MECHANICAL BALANCE OF MASS AGAINST MASS

canvas, together with some interesting object, like a flower or an animal, one would expect to find on the opposite side some vista of depth or direction of attention by means of line or motion."

In this substitutional symmetry a small, interesting object is found to balance a larger but less interesting one.



DISREGARDS THE LAW OF BALANCE

3. *Stability.*—Here we may again quote Gordon: "Another phase of the problem of balance is the distribution of masses and space between the upper and lower parts of a composition. An arrangement may be symmetrical on its right and left halves, but wholly unsymmetrical as between upper and lower halves. In general, to prevent top-heaviness and give, as it were, enough ballast to a composition, there should be more below the center than above it. Pierce's experiments show that the principle of stability is even of more moment than that of left and right balance. An inverted pyramid would be an unpleasant and precarious-looking structure. The visible sign of a sure equilibrium is breadth of base, and most massive things are built to slope by more or less obvious degrees toward their tops.

It is not true, though, that all beautiful and well-poised forms are larger at the bottom; very good effects are sometimes secured by putting the mass of the thing represented near the upper limit of the picture. A mass of graceful flowers may fill the upper part with only their slender stocks below; a drift of clouds or a flock of birds may be shown high up in the picture, with only a few landscape lines below, the nearest approach to empty space. Why do not such pictures look as top-heavy and unstable as the inverted pyramid?

"The reason is that they represent things that are not dead, inanimate weights, but are delicate and light. Placing the flowers or clouds or birds above the center of the picture, with the empty space below, is just what suits their character, and brings out their lightness and buoyancy. These two facts, then, are part of the same truth; to gain stability, large masses must be below the center, and this is appropriate when the masses are supposed to be heavy; to gain freedom and buoyancy, masses may lie above the center, and this is appropriate when the masses represent something light."

CHAPTER X

FEELING TONE OF CONTENT

Under this heading come the topics: color quality, color harmony and balance, relations of feeling tone to imagination, imagery types, feeling tone of words, pictures and associations, and the curious facts of synæsthesia. These topics we now take up in order.

CHARACTER OF COLORS

To sensitive observers the simple colors, taken separately, possess different emotional tones. This tone depends partly on the physiological factors already discussed, and partly on associations which may have been originally of a more or less arbitrary kind. On this point I can do no better than quote from Gordon's "Æsthetics" (p. 146).

1. *Red.*—"Red has been compared to the blare of a trumpet, loud and ringing; it is also known as one of the 'warm' colors. Some clue to the emotional effect of a color is gained by a glance

at the associations and the symbolism which have grown up around it. Red, the color of the blood, is the symbol of passion and death. Among the Chinese it is said to denote virtue and truth. With the ancient Romans the red flag was the battle signal. In the middle ages of Europe the candidate for knighthood was invested with the red garment in token of his readiness to shed his blood. In the Christian era Christ and the Virgin are very generally represented as wearing a red tunic under a blue mantle. The symbolic use of red in modern art is illustrated in Rossetti; in 'Dante's Dream' the angel of love is all in scarlet and scarlet poppies strew the floor, and in 'Beata Beatrix' there is the scarlet dove. A distinction was made, in religious art, between different qualities of the same color; for example, a clear red denoted a pure feeling, but a muddy red was the hue of sin. In Abbey's 'Holy Grail' paintings the robe of Gallahad is a clear red."

2. *Yellow.*—"The yellow of the spectrum is the brightest of all the spectral hues. It is joyous and uplifting; in the orient a sacred color, a symbol of faith and of the sun. The Christian church, however, made yellow the color of dishonor, and in popular symbolism it stands for jealousy and decay. Pale yellow and gold are among the most

adaptable colors in the sense of making pleasant combinations with almost any other color. Both red and yellow are usually spoken of as strong or exciting colors, though the type of excitement is not the same in both. Red is said to suggest a hurried, onward, dashing, but orderly movement, accompanied by sound; yellow a lighter, airy, whirling movement."

3. *Green.*—"Green belongs to the cool end of the spectrum, and is less exciting than the reds and yellows. Grant Allen points out that green is, among primitive peoples, relatively unprized. He says the men in civilized communities, i.e., in cities, have missed the green of the fields and woods, and hence have come to the appreciation of it. In Christian symbolism it stands for hope and inspiration. We connect it also with spring-time and growing things."

4. *Blue.*—"Blue is generally felt to be cool and calm and to be suggestive of stillness and depth. Ruskin writes as follows: 'Wherever Turner gives blue, there he gives atmosphere; it is air, not object. Blue he gives to his sea, so does nature; blue he gives, sapphire deep, to his eternal distance, so does nature; blue he gives to the mighty shadows and hollows of his hills—but blue he gives not where detailed and illumined surfaces

are visible.' Lafcadio Hearn writes similarly and says that blue appeals to one's ideas of 'altitude, of vastness and of profundity,' and that it is the 'tint of distance and vagueness.' And again, 'Vivid blue, unlike other bright colors, is never associated in our experience of nature with large opaque solidity.'

"Blue tones, thus, since they are enveloping, atmospheric and spacious, should be proper for the decoration of backgrounds, of walls and of ceilings. The beautiful fitness of Puvis de Chavannes' mural paintings is due in part to their soft prevailing blues. Blue in Christian art and in popular symbolism is the color for constancy."

5. *White, Gray and Black.*—"White stimulates a joyful but serene mood. It is the symbolic color of joy and purity. Gray is of all colors the most sober, quiet and subtle. A laboratory subject, whose task was to look at a large sheet of gray paper and to record her impression of the color experience, wrote as follows: 'Visually a pure gray, it gives the impression of softness and depth. I seem to hear its very quietness. Its gentleness of gradation and of shading suggests grace, delicacy, and expertness. The whole experience is one of neatness, delicacy, and refine-

ment, which ideas produce a bodily feeling of reverence or of deference.' ''

Poetically we find gray referred to as a ''chastened tinge'' or as ashen or sober.

Black by itself is melancholy and depressing, it is the symbol, among western peoples, of grief and death. It stands also for quiet. In combination with other colors, particularly when it is limited in extent, black makes the impression of great concentration and strength. No other color has more ''character'' than black.

COLOR COMBINATIONS

Without going into the technical aspect of color mixture or of decorative design we may give several leading principles of agreeable color combinations:

1. Cool colors harmonize well with their own tints, but tints of warm colors usually harmonize best with other colors, or with their own shades.

2. Complementary colors combine agreeably, but combinations of colors not quite complementary (leaning toward the warm end) are usually preferred.

3. Oranges and yellows and golds have the most acceptable harmonizing qualities, and they com-

bine well both with their own shades and with other colors. Even discordant colors can often be reconciled by joining their edges with a band of gold.

4. For the most part, colors combine pleasantly with the white-gray-black series. But it seems that the better a color harmonizes with other colors, the less pleasing is it in combination with gray.

5. The most agreeable combinations, according to Kirschmann, are those which exhibit three kinds of contrast effect, namely: Contrast of hue, of brightness and saturation.

6. For brilliant and vivacious effects the contrasted color scheme is the best suited. "This would show, perhaps, two key colors, whose tints and shades would weave together, or, according to some, a concentrated scheme must represent the three colors red, blue and yellow" (Gordon, p. 151).

7. For a more uniform and subdued effect the gradual transition of the dominant method is better suited. Here "there should be one prevailing hue, and variations should be introduced by changes in the saturation and brightness and by limited changes in hue. There might be touches of contrasted colors, but not enough to interfere

with the impression of a single governing hue'' (Gordon, p. 151).

COLOR BALANCE

1. *Quantity* (From Gordon, p. 153).—''When two masses of color are alike in every way, hue, brightness, saturation, size, shape—occupying symmetrical positions on either side of a picture or design—they are said to balance. In this figurative conception of balance the center of the picture is regarded as a fulcrum and the horizontal distances out from the center are the two arms of the lever. We know that in maintaining a literal physical balance, if we shorten the arm of a lever on one side we must increase the weight on that side, but that if we lengthen the arm we must diminish the weight. The same thing is true of the apparent balance between color masses. A small color mass far out from the center balances a large mass close up to the center. A more complex problem presents itself when the two opposed colors are no longer of the same quality; when, for instance, blue must be balanced with orange, or yellow with green. Experiments show that (on a dark background) a small mass of bright color seems to balance a large mass of dull color. If, then, we had a bright and a dark

mass of equal size the bright mass should be put on the shorter lever arm, that is, nearer the center of the picture, since its extra weight must be offset by short leverage. . . . On a light background the more a color approaches black the greater its weight or value."

2. *Quality.*—Besides this quantitative balance, there is a balance of quality depending on the phenomenon of contrast. According to Ross ("A Theory of Pure Design"), "Tones, simply as tones, disregarding the positions, measures, and shapes which may be given to them, balance, when the contrasts which they make with the ground tone upon which they are placed are equal."

Says Gordon: "When a composition contains three or more hues, then a balance becomes possible. In a design of white, gray, and black the brightnesses balance when the gray is as much darker than the white as the black is darker than the gray. The hues of yellow, greenish yellow and orange yellow would balance if the greenish and the orange yellows were removed by equal degrees from pure yellow. It is also proper to speak of a balance of saturations when two tones vary by equal degrees of saturation from a ground tone."

So much for the *feeling tone of form and arrangement.* It is impossible in the time at our disposal to illustrate each of these facts in the concrete field of advertising. The composer or designer must himself make the applications. But the propriety or impropriety of a given form ought to be fairly obvious if the foregoing principles are borne in mind. Thus the writer recalls an advertisement for beds and mattresses in which the composer sought to convey an atmosphere of quiet and repose. But the effect was utterly destroyed by the insistent activity of a diagonal line of type and contrasting color which ran across the composition. Moreover, the colors selected for this appeal were not the quieting and soothing blues and greens, but aggressive and irritating oranges and yellows. The best way to realize fully the importance of these laws of feeling tone is to go about looking for examples of their violation.

The lines, forms, relations, colors and distribution of elements should so far as possible reflect the character of the goods or the mood desired in the reader. A patent illustration of this would be the fact that in selecting type faces, bulk, weight, mass or strength demands heavy, strong, bold faced type, while an appeal to feeling or emo-

HARMONIOUS COÖRDINATION BETWEEN SUBJECT, TYPE AND TRADE-MARK

tion should be conveyed by means of artistically formed letters, shaded type, with free, flowing or graceful lines. Observe the accompanying il-

lustrations, which show the effectiveness of such selection.

FEELING TONE AND IMAGINATION

The feeling tone of a given composition of reading matter and cut will also depend somewhat on what is called the imagery type of the reader. We can think of objects even when they are not present to our sense organs. Thus I can call up in my mind's eye more or less vividly my boyhood home, and seem to see, though more obscurely than if I were present on the spot, the house and barn, the grape arbor, the garden, even my little bookcase in the library. I can smell the honey in the bee boxes and can hear the general hum and stir of the hives. I can do this because I can call up images of these past experiences. Or by putting together the images of wheels, sails, birds, ropes, etc., which I have actually seen in the past, I can create in my mind's eye an aeroplane of a pattern which has never yet been constructed.

Similarly, if you read the following list of words through slowly, you will find that each word calls up some *image* of the thing it represents.

Violin	Earthquake
Beefsteak	Falling from a balloon
Subway	Battle
Cheese	Caruso
Surf	Elevator

You will find, further, that some of the images come quickly, others slowly; some are strong and vivid, others faint or obscure; some words will call up visual pictures, some auditory, others feelings of movement, still others tastes, smells, touches, temperatures, etc. You will likely find that in your own case the swift and vivid images will all tend to be of the same type: visual, auditory, etc., as the case may be.

But if you compare your results with those of several of your friends you will likely find striking differences. One will think of "earthquake" in terms of rumbling noises, another in terms of irregular and sudden tossings and movements of his own body, while still another will see falling buildings, smoke, and frightened people in his mind's eye. With respect to their normal and most vivid imagery, people show not universals but types. And the result of such an experiment as that above will usually reveal the imagery type of the reader, that is, it will show what kinds of

imagery he employs easily, quickly, vividly and most frequently.

Thus one observer recorded 2,500 of his own images during two years of study of the subject, and recorded the following table:

TABLE IX

Visual	57%	Organic	1%
Auditory	20%	Taste	6%
Olfactory	6%	Motor	3%
Tactual	4%	Emotional	1%
Temperature	2%		

The two types that are most pronounced are the *visual* type and the *auditory-motor* type.

Images of the so-called "lower senses," touch, taste, smell, temperature, etc., are both slow and weak as well as infrequent with most people. But in describing such things as clothing, furniture, food products, toilet articles, fabrics, soaps, perfumes, etc., the advertiser desires very much to arouse such images. If they can be aroused successfully, they not only add tremendous interest to the advertisement itself, but they may actually constitute selling points for the article described. This will be especially true of all appeals made over the *short circuit*—all appeals to the appetite, the instincts, the feelings and emotions of the prospective purchaser. And it is precisely with such articles as those mentioned above that the

feeling appeal seems to be most effective—articles which contribute toward personal comfort, convenience, pleasure and satisfaction, and which yet do not involve any great expenditure. It is well, then, to point out the ways in which these images may be most effectively aroused.

1. *Words.*—It is difficult to arouse images of touch, taste, smell, temperature, appetite, etc., by means of *words*. But it can be accomplished if the words are chosen carefully for their poetic quality and applied with a certain moderate profusion and cumulative effect. The poetic qualities of words depend on two chief factors.

(a) Their phonic composition.—Certain combinations of oral sounds are in themselves agreeable, and the advertising writer should develop a delicate sense for the feeling tone of sound combinations. Compare, for instance, the auditory distastefulness of the words in the first column with the agreeableness of those in the second.

I	II
Tootsie Rolls	Sapolio
Lemon Squash	Ivory
Waw-waw Sauce	Electroline
Bootz Cordial	Clover Farms
Beakes Dairy	Crystal Domino
Stink	Spearmint
Foot-Eazer	Shakamaxon

This matter of phonic feeling tone can be best studied by using words in a foreign language, whose meanings are unknown. The elements of association and poetic usage are thus eliminated, and striking results are secured. Thus a French woman is reported as having said that "cellar door" is the most pleasing of English words.

(b) Besides arousing the feeling tone due to phonetic composition, words may be pleasant or unpleasant because of *associations* which cluster around them. These associations are largely due to literary usage, though this usage will usually be found to depend on simple psychological facts due to the quality, composition, origin or history of the words themselves. Thus there tends to be, on the whole, a certain set of words which, while conversationally satisfactory, are felt to be inappropriate for use in literary composition. And even in the language of writing, as distinct from language of conversation, certain words and groups of words seem to be sacred to poetry, romance and song. Compare, with this idea in mind, the two following columns of words.

I	II
Horse	Steed
Girl	Maiden

Writing	Scripture
Book	Volume
Candy	Sweet-meat
Jump	Leap
Hogs	Swine
Light	Ignite

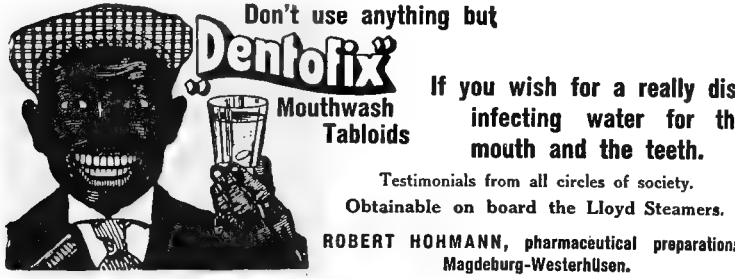
The factors involved here are too complex for brief discussion. It must suffice to point out that the image-power of words depends largely on their feeling tone. An appreciation of this feeling tone must come from literary training rather than from scientific experiment.

2. *Pictures.*—A peculiar thing about these images from the lower senses is that, although they are not easily aroused directly by words, they come rather easily and vividly when a visual image or impression is present to help them into consciousness. Consequently, the most effective way of producing them is by means of suggestive pictures of tasteful scenes associated with the article, or by a tempting array of pictures of the objects themselves, in a setting which itself possesses agreeable feeling tone.

The important thing here is the necessity of avoiding *disagreeable images* or *negative suggestions,* either in,

1. The picture itself.
2. The reading matter.
3. The name or brand mark.
4. The adjacent advertisements.
5. Chance associations.

These points can be best illustrated by giving instances of their violation.



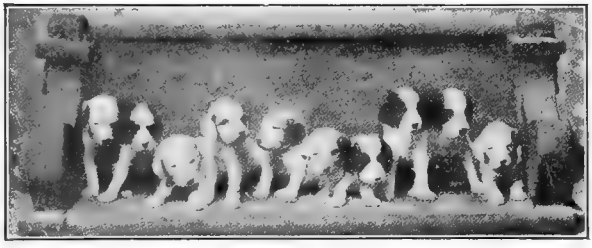
INAPPROPRIATE FEELING TONE MAY IN SOME CASES BE PROVOKED BY THIS ADVERTISEMENT

1. The picture of a guest at a restaurant table refusing a substitute for some article the name of which appears nearby in bold type is likely to associate the act of rejection with the very article advertised.

2. The suggestions of substitutes, even in the nature of warning, is considered in general to be a bad method psychologically. It calls up extrinsic, foreign imagery, in the place of relevant pictures.

3. The third point is constantly violated by advertisements which associate disagreeable words, objects or people with the commodity, as

Slimy fish with medicine
Guinea pigs with toilet preparations
Tramps with soap and lotions
Cattle with tobacco
Frogs with coffee
A dirty floor with soup
Butterflies with sugar etc.



FEELING TONE OF ASSOCIATIONS INAPPROPRIATELY USED. Cover of a folder issued by Schonland Bros., sausage manufacturers in Portland, Me. (From *Advertising and Selling*, Dec., 1910.)

4. Writers have frequently pointed out the futility of placing a breakfast food advertisement alongside one for an asthma cure, that of a delicate dessert next to a remedy for eczema, etc. The important principle here is that the feeling tone of an appeal depends not entirely on our reaction to that appeal alone, but also on our

general mood at the time. And this general mood is easily influenced by adjacent advertisements, recent experiences, etc.

5. In illustration of the rôle of chance associations we may instance two facts:

A. An article may be surrounded with a favorable atmosphere, a favorable association cluster, by utilizing an atmosphere already created for another purpose. Thus our attitude toward a Yale bicycle or a Yale pipe is influenced by what we already know of the efficiency of Yale locks or of the prowess and reliability of Yale's football team. Arcadia Mixture smoking tobacco has been sold to many a smoker because of the delightful atmosphere previously drawn about the name in J. M. Barrie's "My Lady Nicotine." There may be certain unethical features involved in such utilization of borrowed atmosphere, but the psychological basis for its success remains, nevertheless.

B. Synæsthesia.—An interesting phenomenon which may some day become of concrete use to the advertisement writer is the fact that certain sensations are often closely associated with sensations from quite different sense departments. Thus sounds of musical instruments, vowels, syllables, may be seen to be *colored*. One man on

record sees consonants as purplish black, while the vowels vary in color. "U" is a light dove color, "e" is pale emerald, "a" is yellow, etc. Thinking of the word "Tuesday," the first part seems light gray-green and the latter part yellow.

In some cases colors accompany the sensations of taste and smell. Salt, for instance, is described by one observer as dull red, bitter as brown, sour as green or greenish-blue, and sweet as clear bright red. One observer sees the taste of meat as red and brown, Graham bread as a rich red, and all ice creams—except chocolate and coffee—as blue. To another observer the sound of the word "intelligence" tastes like fresh sliced tomatoes and "interest" like stewed tomatoes!

These synæsthesias, as they are called, seem, however, to be so individual and personal that no two people are likely to agree on them by present methods of inquiry. If there were more general laws there could be much clever and subtle selection of appropriate colors, words, etc. At present, however, no such laws can be announced.

STRAIN AND RELAXATION

In discussing the suggestive character of horizontal and diagonal lines we have already had

occasion to refer to *feelings of strain and relaxation.* Feelings of this sort are of particular importance in another connection, that of the legibility of type when an appeal is presented to the sense of sight. Many an advertisement fails to

THE HOTEL SEVILLE OFFERS VERY DESIRABLE SUITES OF ANY NUMBER OF ROOMS, WITH ALL MODERN IMPROVEMENTS. THE ROOMS ARE OF VARIOUS SIZES, EQUIPPED WITH LARGE CLOSETS, ARE WELL FURNISHED AND WELL ARRANGED. STRAIN

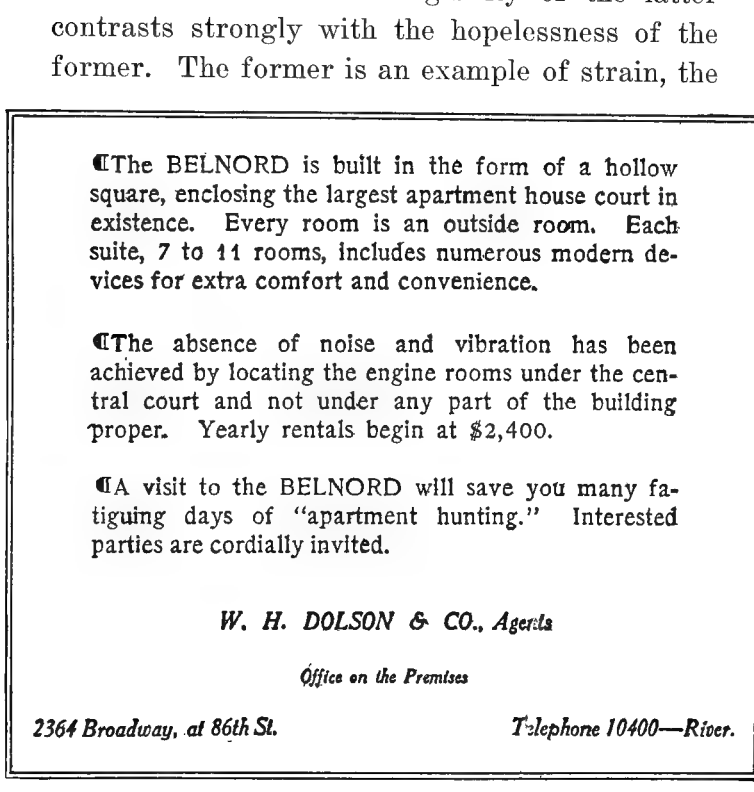
influence simply because it is so difficult to read that few individuals take the pains to decipher it. The Hotel Seville announcement shows an advertisement of this sort, which has caught my eye many times, but which to this day I have not yet read, nor shall I ever read it through. Compare this hotel announcement with that of the Bel-

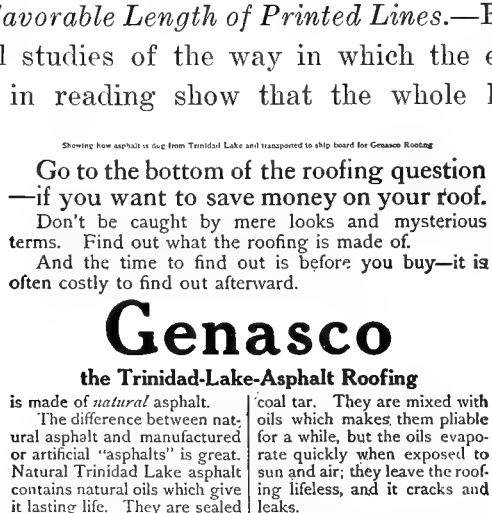
nord. The comfortable legibility of the latter contrasts strongly with the hopelessness of the former. The former is an example of strain, the



RELAXATION

latter an example of relaxation, both being dependent on the legibility of the appeal. In this connection it may be useful to point out some of the factors which make for legibility of printed matter.

1. *Favorable Length of Printed Lines.*—Experimental studies of the way in which the eye behaves in reading show that the whole line of



Showing how asphalt is dug from Trinidad Lake and transported to ship board for Genasco Roofing

Go to the bottom of the roofing question —if you want to save money on your roof.

Don't be caught by mere looks and mysterious terms. Find out what the roofing is made of.

And the time to find out is before you buy—it is often costly to find out afterward.

Genasco

the Trinidad-Lake-Asphalt Roofing

is made of *natural* asphalt.

The difference between natural asphalt and manufactured or artificial "asphalts" is great. Natural Trinidad Lake asphalt contains natural oils which give it lasting life. They are sealed in Genasco and stay there to defend it permanently against rain, sun, wind, heat, and cold.

Artificial asphalts are residual products. Same way with coal tar. They are mixed with oils which makes them pliable for a while, but the oils evaporate quickly when exposed to sun and air; they leave the roofing lifeless, and it cracks and leaks.

When you get Genasco you can be sure of roofing that lasts. And roofing that lasts is the only kind worth having.

The Kant-leak Kleet is the lasting waterproof fastening for seams—prevents nail-leaks, and does away with unsightly cement.

Ask your dealer for either Genasco mineral or smooth surface roofings with Kant-leak Kleets packed in the roll. Fully guaranteed. Write for the Good Roof Guide Book and samples.

THE USE OF LOWER CASE LETTERS AND OF FAVORABLE LENGTH OF LINE. Reading matter made legible and more likely both to attract and to hold the reader's attention.

printed matter is not seen at once and as a whole by the eye. Nor are the separate letters each fixated in succession, nor are the successive words even examined one by one. The eye fixates

three or four points in reading the line, these points falling where they may—now in the middle of a word, now at the beginning or end, now between two words. When the printing is legible a given line thus requires few movements for the comprehension of the words—a few fixations will cover the whole of the line. But when the printing is difficult to read clearly, the separate letters or words difficult to discriminate from each other, more fixations are required, and these extra fixations mean strain and fatigue. The most comfortable length of line, for ordinary printing, is found to be about three and one-half inches.

2. *Appropriate Spacing of Letters, Words and Lines.*—The spacing used should indicate the natural unities of the material presented. Thus the space between letters making up a word should be less than the width of the letters themselves, while the space between adjacent words should be greater than either of these two distances. The space between sentences should be somewhat greater still. If a number of lines are intended to belong together as a unit or paragraph, the spacing between the various lines should be somewhat less than the width of the lines themselves (as measured by the height of the letters). If this rule is not followed, the space

between paragraphs should be then increased, in order to suggest the unity of the paragraphs. In-

ILLEGIBILITY RESULTING FROM THE EXCLUSIVE USE OF CAPITAL LETTERS IN READING MATTER DESIGNED TO HOLD THE READER'S ATTENTION.

dentation of paragraphs and even of every other line in the printed matter is found to facilitate the process of reading.

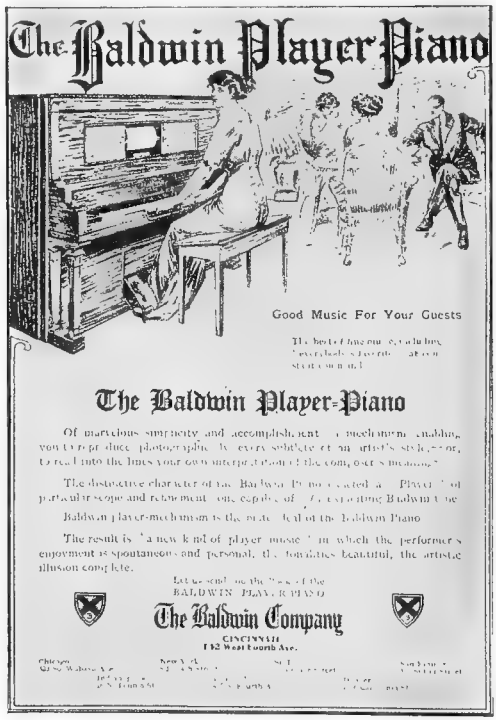
3. We have already seen that we tend to find

meaning in the tops rather than in the bases of things. This is particularly true in reading

Illegibility and Strain Are Produced by Too Great Variety of Type Faces, Interrupted Lines and Ineffective Spacing. All of these make rhythmical movements and adjustments impossible.

printed matter. The eye tends to follow the upper part of the line of letters, and the upper parts of the type faces are the parts which show variety and differentiation as between the different let-

ters. Partly for this reason the "lower case" letters are more easily perceived and read than are



ILLUSTRATING THE EASE OF READING AND FEELING OF RELAXATION PRODUCED BY THE USE OF LOWER CASE LETTERS AND BY THE PRESENCE OF APPROPRIATE SPACING.

capital letters. Franklin Automobile Company's advertisement illustrates the difficulty of reading printed matter composed entirely of capitals. In the case of the Peck-Williamson Company's ad-

vertisement the illegibility is also partly a matter of faulty spacing. The Baldwin Company's advertisement combines the ease of "lower case" letters with favorable and appropriate spacing. It also shows the ease with which the "lower case" letters are read.

4. Ease of reading is interfered with by too great a variety of type faces. Thus the "Underfeed" advertisement is most illegible, partly because of the lack of unity and organization, but largely also because the thirty different kinds of letters and type faces occurring on a single page call for excessive and uncomfortable changes in adjustment at irregular intervals. One of the things which most facilitates easy reading is the possibility of falling into rhythmical habits of eye movement across the page and back again, and rhythmical changes of adjustment of the optical apparatus from moment to moment.

5. A fifth factor of importance is the fact that not all type faces of the same size are equally legible. The type faces which happen to have been most used in printed advertisements turn out, under experimental conditions, to be the least legible of a large group of faces and styles which were studied. The table on page 187 gives the legibility of each of nine different faces, lower

case letters only, when these letters occur grouped as in words. The legibility was measured by determining the maximum distance, in daylight illumination, at which the letters could be correctly identified. Each letter of the alphabet was tested 12 times, twice by each of 6 observers, and the results of the 26 letters were averaged to give the final measure of the type face as a whole. The measures in the table give the number of centimeters at which the given type face can, on the average, be read. All letters used were what are known as 10 point letters, the faces all being Roman, no bold or italic faces being used. Tables for upper case letters and for lower case letters, for 16 different faces, the letters occurring both in groups and in isolation, may be found in an article by Roethlein in the *American Journal of Psychology* of January, 1912. Legibility was found to vary little with the form of the type, but to depend chiefly on the size, width of line, and amount of white space exposed between the letters. The faces differ less when the letters are grouped than they do when the letters are observed in isolation. And it must be said here that even these measurements are by no means complete statements of the legibility of the type faces when used in printing, because much of our read-

ing is done, not by perceiving the separate letters which make up the words, but very largely by recognizing the words as wholes, by means of their characteristic "word forms."

Type Face	*Order of Legibility, cm. distance*
News Gothic	166
Cushing Old Style	165
Century Old Style	162
Cheltenham Wide	159
Century Expanded	159
Scotch Roman	151
Bullfinch	150
Caslon	149
Cushing Monotype	144

Illustrations of these faces may be found in many manuals of reference and data books used by printers and advertising men.

6. A final factor which may be mentioned as contributing toward relaxation in reading printed matter is the background on which the letters occur. A maximum brightness difference between background and type makes for easy perception. When colored background or type is used, the same rule holds, for it is not the difference in color as such, but the difference in the brightness values of the colors used which is effective. We have already had occasion, when discussing *contrast* as an attention device, to explain the greater attention value of black on white, as contrasted with white on black, and to point out that we are

not concerned there with a real difference in legibility. There is some difficulty in reading printed matter which does not differ sufficiently from the brightness of the background on which it appears.

CHAPTER XI

THE THIRD TASK: FIXING THE IMPRESSION

Clearly the work of an appeal does not stop with attracting attention or even with holding it until the copy is read. Rival appeals will be operating, and, if they are at all effective, will have a certain persistence in the consciousness of the reader. Evidently an essential function is that of being able to so impress the reader that in a later moment, when there is *need* felt for an article of the general type, this particular brand will suggest itself as the first of its kind. This recurrence of a previous idea we call a recollection. Now, ideas do not spring up spontaneously in the mind. So far as we can see, an idea is always introduced by virtue of its connection with a preceding thought. If in a moment of need the specific name of an article designated to fill that need is thought of, this happens because that particular name has been, as we say, associated, linked up with the situation of need more firmly than any other name for a similar article. This

dominance of ideas is what we are concerned with in the psychology of *association*. Ideas occur by virtue of previous connections, and these connections are determined by definite laws, can be brought about and facilitated by specific devices, or weakened by failure to conform to these rules.

We shall be better able to understand the laws of association by knowing something of the nervous processes on which they depend. Association takes place when nervous energy from one center flows out into related centers, causing a corresponding related consciousness. This overflowing of energy must take place along a nervous pathway, and this pathway must be formed in the nervous tissue before the exchange is direct. The general rule is that energy radiates out in all directions from a center so long as all the possible paths have equal resistance. Now, if two adjacent centers should discharge at the same moment, there would be a pathway between them which would be doubly excited, and hence its resistance would be lowered. Thus suppose three processes, A, B, C, to have occurred at the same time. Such a pathway will be at once formed between the centers corresponding to these processes. Whenever either of the three occurs at a

later moment it will tend to excite the centers corresponding to each of the others. *Every element thus tends to bring up again the whole of which it was previously a part.* Thus the sight of either of the three words, "Company," "Boston" or "Rubber" will tend to remind the reader of the whole phrase, "Boston Rubber Company."

Three primary laws may be laid down here:

1. Every nervous current leaves traces of its pathway.
2. This trace facilitates the passage of subsequent impulses over the same pathway.
3. Such a pathway tends to drain off energy from other centers which may be active only in a random way.

This process of linkage between the two ideas such as "Boston" and "Rubber" is what we mean by *association.*

PRINCIPLES OF CONNECTION

There are two fundamental principles of association which advertisements persistently and flagrantly violate. In natural thinking there are two laws that control the play of our ideas. Both laws are true in general. But in order for the

advertiser to be effective, he must set one of these laws against the other.

1. The first law is that *we tend habitually to think from particular to general.* If I hear or read "Ingersoll" I at once think "watch," the general class of which the "Ingersoll" is but a particular. If I hear "Rambler" I think "bicycle," "Ditson"—"saws," "Maydole"—"hammers," etc. Now, this is a perfectly natural tendency, but it is of no use to the advertiser, who wants us, not so much to think "watch" when we hear "Ingersoll," as to think "Ingersoll" when we need a watch, "Cluett" when we need a shirt, "Burns" when the general idea "coal" is in the mind. That is, in order to attain his end, the advertiser must force us to *violate a fundamental law of thinking* and to go not from "shirt" to its class "garment," but down to a *particular* shirt as "Cluett."

Now, the strangest part of it all is that the average advertisement not only fails to realize this necessity, but even works against itself by failing to recognize the second general law, *the forward law.*

2. *We tend to think forward rather than backward.* Associations tend to take their original direction and have only little influence in the

reverse direction. You cannot tell me without some reflection what letter comes before the letter "I" in our alphabet. When you can, you will find that you have recalled it by starting with "A" and going *forward*. From "H" to "I" is a perfectly natural transition, but from "I" to "H" is a violation of the law. Similarly you can tell me much more quickly last names of men with given first names than you can the first names of a row of last names. The same is true with a line of poetry. The first word calls up the whole line, but the last word, although it has previously existed in consciousness along with the preceding words, does not tend to call them up to anything like the same degree. Subsequent impulses tend not only to follow old pathways, but they tend to follow them in the direction of the original connection. So if I hear "George" I tend at once to think "Washington." But if I hear "Washington," I do not go back to "George," but forward to "monument," "square," "bridge," etc.

The reason for this first principle is simply that nervous energy tends to spread out from the centers of origin into all related or connected centers, thus calling into play the whole class. The reason for the second law is not clear, but we

may be sure that it has some stable basis in the structure of the nervous pathways.

Here, then, we have a principle which can be employed to counteract the tendency of principle 1.

FORWARD REASONING—CORRECT ARRANGEMENT

We tend to think from particular to general, *other things being equal.* But, if in reading an advertisement, our thought has been repeatedly led from a general to a given particular, by the composer putting the general term first and following it by the particular, *the second law is able*

to offset the first. The general rule should be, then:

BACKWARD REASONING—INCORRECT ARRANGEMENT. The effective method is to *present first* the name of the commodity, or the idea, need, occasion, which shall be in the reader's mind on subsequent occasions. *Follow this* by the name of the particular brand, the firm name, the trade mark, the slogan, etc., which you desire him to think of at the moment when he thinks of the commodity or feels the particular need.

Place first the *general class,* the *purpose or use* to which the article can be put, the word which

will be in consciousness *in the moment of need.* Thus, "the best of Christmas gifts."

Place next the *name of the article or brand* which you desire to connect with the need, or which you desire to make the standard specimen for the general class in question. See the Copley prints advertisements.

If, instead, the first word in the advertisement were "Copley prints," and only later came the words, "best Christmas gift," the idea of "prints" would come to remind the reader of "Christmas," but when he found himself thinking over the "best gift" to purchase there would be no particularly strong inclination to think of "Copley prints."

It seems to the writer that no law is violated oftener than this in current advertising, and that the law is no mere subtlety but an important element in the general efficiency of copy. In fact, the law may be conformed to so fully that the specific brand may come to be synonymous, in the mind of the public, with the general class or use. When this point is reached it becomes necessary to teach not association but dissociation. Thus the Kodak copy must now teach people that not all cameras are Kodaks. The law of association worked so thoroughly here that it now operates

against its original purpose. The case nicely illustrates the fallacy of relying solely on any one principle and disregarding others.

The chief method of fixing an impression received from an advertisement is by connecting it up with the stimulus in which the need for some such article will be felt. There are various ways in which this connection may be made.

I. LAWS OF ORIGINAL CONNECTION

1. *Contiguity.*—This is perhaps the most frequent cause of association. Things perceived side by side, either in space or time, tend to suggest each other, on recurrence of either. Thus "Brooklyn Bridge" calls up "East River."

If a place of business is announced as being "one block from Grand Central" or "near Herald Square," the thought or sight of Grand Central or Herald Square will tend to revive, by association, the name, business, and location of the advertised store.

2. *Similarity.*—Things bearing a resemblance to each other tend to call each other up in consciousness. They do this because certain elements in the two facts are identical, hence tend to call up both wholes of which they have previ-

ously been a part. Thus one person reminds one of another because the two have identically shaped noses. One biscuit reminds one of another because the color of the box is the same. The Jungfrau reminds us of Pike's Peak; Moxine reminds us of Moxie, and will take unto itself any atmosphere of desirability that Moxie has developed. Similarly Yale locks will sell Yale bicycles. The general sentiment seems to be against the use of such similarity appeal as is involved in the reference to substitutes and imitations. Obviously this is only from the point of view of the original article. If you happen to be engaged in the manufacture of substitutes the more of the original atmosphere you can borrow, the better.

3. *The third basis of association is emotional congruity.* This simply means that the *feelings* aroused by two different experiences are the same, and whenever one comes, the feeling produced tends to call up the other also. Thus falling from a trapeze once reminded me vividly of a time when I was chased by an Indian with a tomahawk. The importance of the æsthetic factors of an advertisement comes here strongly into prominence. Not only do pleasing advertisements attract us, and hold us, but we in turn hold them.

Furthermore, any experience with strong feeling tone is better retained than indifferent facts. This is of especial importance in appeals over the short circuit, appeals to feelings and emotions for the sake of vividness.

Connection with pleasurable emotions fixates associations and tends to lead to action. Appeals through sympathy, loyalty, interest, civic pride, local atmosphere, through excitement over current events, through prevalent ideas, crazes, desires, movements, etc., will all tend to be more or less successful, though transiently so. Such advertising must keep constantly changing in tone and direction, and it is both difficult and expensive to "keep one's finger on the public pulse" closely and delicately enough to be able to use these social currents to advantage. When the local excitement has blown over and the incident tends to be forgotten, the article advertised in connection with it tends to be forgotten along with it.

A safer plan is to utilize the stable and permanent emotions more or less common to all times and places. Thus a powerful basis of appeal and spring of conduct, for certain kinds of commodities, is the religious emotion. It is reported that a book entitled "Wonders of Nature" fell flat on the market. The title was changed to "Wonders

of Nature and Architecture of God," and a second edition was at once called for.

II. PRINCIPLES OF REVIVAL

The foregoing are called the *principles of connection* because they have to do with the process by which an association is originally produced. But the fact that a connection has been made does not guarantee the reproduction of the pair. For several ideas might each have been connected with the stimulus, and they could not all be revived at once. There is, then, a further question, viz., how, granted a connection once made, can we be sure that one associate will come rather than some other?

In answer to this question we find a group of principles which we may call the *principles of revival* as distinguished from the *principles of connection.* The first four are the most important. They are, in order of their relative strength:

1. *Frequency.*—Other things being equal, the association most often repeated will be the strongest connection. "Theodore" suggests "Roosevelt," rather than "Sturm," "Cousins," or any other associate, simply because it has occurred more frequently than any other. Every repeti-

tion strengthens the connection, just as every rabbit hopping through the snow emphasizes and defines the path of the rabbit which passed that way before. This is the principle of repetition in advertising. Repetition has both a memory and response value, as we shall see later. In experiments in the laboratory, counting "normal association," or that which results after unemphasized reading, as 26 per cent., *repetition* gives an average value of 64 per cent., nearly three times the memory value of unrepeated material. So among practical men, repetition is considered an effective, albeit an expensive, method of securing publicity. As we have already seen, different kinds of material vary somewhat with respect to their attention value in repetition, relevant words increasing, all cuts decreasing, and irrelevant words remaining on a level. But so far as memory goes, repetition, *if supported by attention,* always strengthens the impression.

2. *The second factor* in relative strength is *vividness.* Vividness may be brought about in many ways—through sheer intensity, through surprise, strong attention, interest, or through connection with some emotion, as fear, hope, envy, etc. The more vivid the impression, the longer it lasts. Strong colors, enormous signs, humor-

ous associations, motor responses such as clipping a coupon, sending an inquiry, etc., are merely varied ways of producing vividness. Compared with the normal value, 26 per cent., vividness gives an experimental average of 52 per cent. efficiency.

Closely related to vividness, and being, perhaps, only special forms of it are:

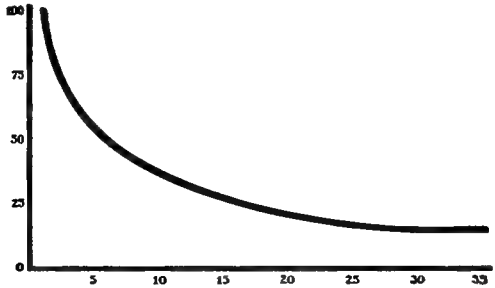
3. *Recency,* with an average value of 50 per cent., and

4. *Primacy,* with a value of 46 per cent.

When all other factors are equal, we can be sure that the first association will predominate. At least the first and last impressions have the advantage. We have already discussed this in the section on "position."

The Curve of Forgetting.—Another important point has to do with the most effective distribution of a series of appeals which are to be addressed, one after the other, to the same person. Circulars, follow-up literature, educational campaigns, etc., often afford instances of this method of appeal. The ordinary method is to distribute the successive appeals according to the calendar divisions of time, as every week or ten days, every two weeks, etc., until all the appeals have been presented. This method proceeds on the as-

sumption that the reader's memory and interest are controlled by the movements of the celestial or terrestrial bodies, while the fact is that memory follows laws of its own, regardless of the conventional and calendar divisions of the passage of time. When a given appeal is addressed to me, I straightway proceed to forget it. But I do not forget it at a uniform rate, so much being forgotten on each succeeding day until all is forgot-



THE CURVE OF FORGETTING

ten. Instead I forget the material that has been seen or learned, according to a definite "curve of forgetting," a curve which descends rapidly at first and then more slowly. The larger proportion of the material is forgotten in the first day or so. After that a constantly decreasing amount is forgotten on each succeeding day.

The height of the curve above the base line here indicates the amount remembered, the figures

along the base indicating the units of time elapsed since first learning the material. During the first ten units as much is forgotten as during all the remaining twenty-five. Of course, the amounts and time units in the accompanying curve are purely arbitrary. Their real value will depend on the quality and the quantity of the material learned and on the time interval chosen. But the form of the curve shows clearly that by far the greater number of repetitions should come at the beginning of the campaign, when the tendency to forget is strong. When the maximum of retention is then reached the later repetitions may be farther and farther apart.

It ought to be obvious at once that the effective distribution of a series of appeals will be a distribution which conforms to this curve of forgetting. The first appeal having been presented, the second should follow close upon it, the third at a somewhat greater interval from the second, the fourth a somewhat longer time after the third, etc., the intervals growing longer and longer until the series is completed. This massing of the appeals at the earlier portion of the total period will result in reinforcement of the first appeal at the crucial moments, the moments when, unless thus reinforced, they tend to be quickly forgot-

ten, thus leaving the later appeals to appear on what is practically barren ground. That is to say, the effective distribution of a series of appeals addressed to the same person will not follow a calendar order such as the following:

1	2	3	4	5
Initial Appeal	After One Week	After Two Weeks	After Three Weeks	After Four Weeks

but will follow a distribution based on the curve of forgetting, as:

1	2	3	4	5
Initial Appeal	After 2 Days	After 5 Days	After 10 Days	After 20 Days

Any one may convince himself of the existence of this law by simply trying to memorize a given amount of material of any sort, by distributing his learning periods or repetitions according to the two plans. This law seems to me to be one of the most important results of the experimental study of memory, and one which the practical man has been surprisingly slow in appropriating.

MINOR DEVICES

Further minor devices for aiding the memory value are: *Ingenuity, rhyme, rhythm,* and *motor reinforcement.* These are really nothing more than forms of vividness, but are distinct enough from each other to merit separate mention.

1. *Ingenuity.*—Just as *novelty* attracts attention and holds it, a curious, bizarre name, package, trade mark is likely to stick. Such words as "Uneeda Biscuit," "Keen Kutter," "Rough on Rats," "Ever Stick," "No Smellee," stick in one's consciousness. The merchant with

Street No. 33
Telephone No. 33
Letters in name, 33
Price of suit, $33

could easily make up an ingenious and impressive advertisement (see Scott). But to be effective under this heading a name must be really ingenious, not merely a hybrid.

2. *Rhyme* and *alliteration* are other things that attract attention and are easily remembered because they suggest in themselves a single unified scheme on which to hang the separate facts.

3. Closely related also is *rhythm,* which reduces the learning of a given amount of material about 40-50 per cent., by lending motor control and further means of association with movements. The writer once tried to teach the English alphabet to a kindergarten class of German children. Several days' effort was unsuccessful. At last the idea occurred to set the letters to the tune of

"Yankee Doodle" and sing them with the class. The alphabet was learned in a single recitation period. Similarly the names of things sung in rhythm or rhyme on the advertising cards tend to be retained. This does not mean, however, that the goods thus sung will necessarily be sold. It is one thing to make a commodity known as "worthy of song" and quite another thing to make it known as "worth buying."

4. *Motor reinforcement* is one of the important aids to memory. Try to memorize a verse of poetry. You will at once find yourself making sets of movements which are designed to aid you in retaining the material; you speak the words to yourself, moving the lips meanwhile, or you write the lines on paper or accompany the learning process by tapping the toes, swinging the body to and fro, nodding the head, etc. Just as clenching the fist or gripping a piece of wood reinforces the leap or brace which one is about to give, so the performance of a motor process in connection with an idea tends strongly to impress that idea in memory. You remember the thing you have done yourself much more easily than the things you have passively observed others performing—the words you write much more easily than the sentence you merely read.

Herein lies the chief importance of invitations to clip out the advertisement, to draw the figure, to write for information or catalogues, to tear off and preserve or return coupons, etc. If the reader can be induced to carry out any such action in connection with the advertisement, the memory value of the copy will be tremendously enhanced. And this follows, not only because more time is spent on the advertisement and more thought given to it, but largely because the motor response reinforces the mental impression.

Obviously the success of such devices will usually depend on the ease with which the action can be carried out. The ideal would be the longest act which the average reader would carry out without the sense of lost time.

MEMORABILITY OF DIFFERENT KINDS OF FACTS

An important factor in putting an article on the market or in keeping it there is that of having a trade mark, emblem, seal, design, or name, by which the article may always be remembered, asked for, recognized and recommended. Herein enter in large measure the preceding factors of rhyme, rhythm, alliteration and ingenuity. But another highly important factor which is little recognized is that of the *memorability of different*

kinds of material. In selecting a mark by which goods, designed for popular consumption, are to be known, it is of real value, for instance, to know that *persons* and *faces* are more easily remembered than *objects,* and *objects* more easily than *actions;* that *form* is more easily remembered and recognized than *color,* although *colors* are more accurately remembered than *numbers.* More numbers can be remembered than colors, but they are likely to be wrongly remembered or remembered as existing in a false order or position.

In a carefully conducted experiment in the writer's laboratory the investigator measured the accuracy with which 40 persons in an audience could observe and remember for a period of three days the various features of an elaborately planned performance which was carried on in their presence. The reliability of each witness was measured, along with the accuracy with which different sorts of facts were reported.

The individual reliability ranged from 38 per cent. to 82 per cent. accuracy, with an average of 62 per cent. It is important to note, then, that the ordinary witness observes only about 60 per cent. of the features of an event to which his attention is already directed. That is to say, 40 per cent. of the advertisements and 40 per cent.

of each advertisement will, on the average, pass unnoticed. Moreover, only about 2 per cent. of readers normally see advertisements. (See Strong.) This gives 2 per cent. of 60 = about 1 per cent. efficiency. Which features, then, will most likely be observed and retained correctly?

The table for this experiment, indicating the relative accuracy with which different sorts of facts are reported when direct questions are asked concerning them, runs as follows:

TABLE X

		Accuracy
1.	Mere presence of things	97%
2.	Number of people	65%
3.	Space relations, form, etc	58%
4.	Condition of objects	48%
5.	Order of events	35%
6.	Color	26%
7.	Size and quantity	22%
8.	Sounds	10%
9.	Time (duration)	8%
10.	Actions (strong attention value but not accurately reported)	

The importance of these facts in selecting trade marks, packages, names, slogans, and points of emphasis for advertising purposes is constantly disregarded.

Another experiment was designed to measure the relative memory value of cuts as compared with that of reading matter. For this experi-

ment proof slips of advertisements designed and kindly furnished by Will Phillip Hooper were used. The advertisements were uniform in size and style, and all contained about equal amounts of cut and reading matter. Twenty-five of these advertisements were examined by each of the observers, who were then requested to select from a collection of ninety advertisements those which they had previously seen. Of the twenty-five original cards, fifteen were present unchanged. Of the remaining ten, five contained the same cut, but the text had been changed, while five retained the original text but bore a totally new cut. The idea was to discover which of these two changes, of cut or of text, would attract more attention, and which would most disturb the memory of the observer.

The following table resulted, showing: (1) that the change in the cut is most frequently detected, thus that the cut has greater *attention* value; (2) that cards with changed cuts are remembered by the text more often than cards with changed text are remembered by the cut, that is that the *memory* value of text is higher than that of cuts; (3) that the combination of the original cut with original text has much higher memory

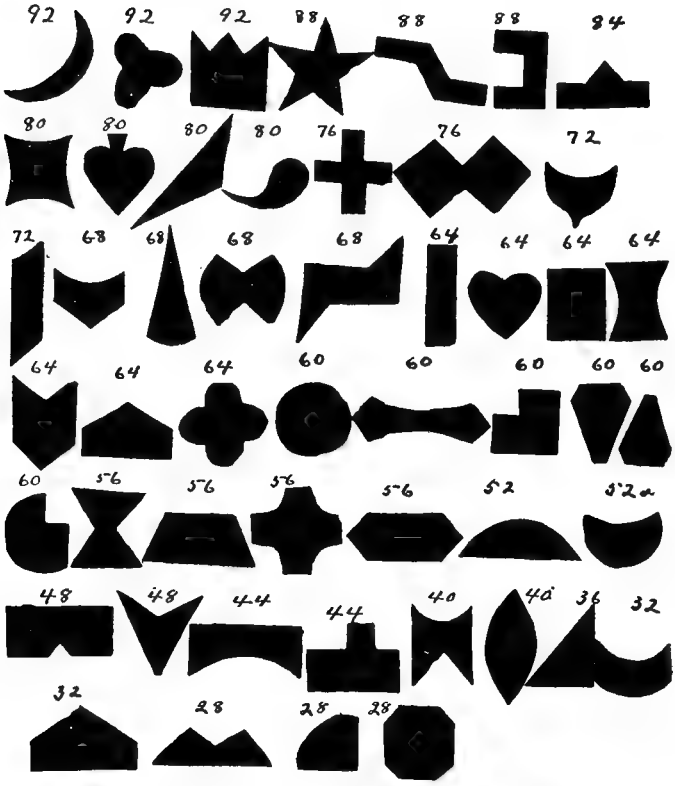
value than that of either of the two mutilated forms.

TABLE XI

Normal ads recognized	77%
Ads with right text but wrong cut	56%
Ads with right cut but wrong text	43%
Substitution of cut detected	26%
Substitution of text detected	17%

TRADE MARKS

In the same laboratory a study has been made of the relative attention and memory value of different geometric forms, such as are commonly used as trade marks. Fifty such designs were chosen, of the same general size and same color. Experiments on twenty-five observers showed these forms to differ widely in the respect tested. The values range from 28 per cent. to 92 per cent. The following plate gives the list of these forms and also the percentage of accuracy with which each was recognized when a group of fifteen previously displayed was selected from a set of fifty which included the original fifteen and thirty-five strange forms. The general principle suggested by this experiment is that those forms are best remembered to which specific names can be given, as "star," "crescent," "crown," etc.



RELATIVE ATTENTION VALUE OF 50 GEOMETRICAL FORMS

VICARIOUS SACRIFICES IN ADVERTISING

The failure to observe the foregoing laws of association and memory often leads to what may be called "vicarious sacrifice" in advertising. A century ago we could consume faster than we

could produce. The situation now is frequently said to be just the reverse, the advertiser often finding it necessary to stimulate consumption. He finds it necessary to create a new need, or to invest an old need with greater urgency, just as Hand Sapolio tried to create an ideal of cleanliness among people not using soap, or as Sapolio created a higher ideal of cleanliness of pots and kettles. (See Balmer, p. 34.)

Once such a demand is created, *non-advertised* articles at once share in the profits. In so far as this happens, the work of the advertiser may be said to be vicarious; it is a free will offering to the non-advertiser. Such sacrifice, however, is often due to the advertising. Thus the early Subway cards of Boston Rubber Company with their "Wet Feet Did It" warnings certainly created a greater demand for *rubbers in general,* but *not* for Boston Rubbers in particular, because this particular brand was not carefully associated in the mind of the reader with the *need.* Experiments which the writer was making with a set of seventy-five subway advertisements at the time showed clearly the tendency not to notice the brand advertised on these cards at all, but to connect the warnings and general feelings of need with a striking card advertising the "Ever Stick"

rubber, which, so far as the writer's knowledge goes, was a rival product. Since that time these cards have been greatly improved.

In conclusion, we may say that a successful advertisement not only *attracts* and *holds attention,* but in so doing it *connects a specific brand or article with a general need,* so that when the general need is felt, the action will not be toward such articles in general, but toward this specific brand in particular. In the following chapter on *provoking the response* we shall seek to analyze still further the ways in which this specific action may be brought about.

CHAPTER XII

THE FOURTH TASK: PROVOKING THE RESPONSE

After all has been said, the final value of an appeal depends entirely upon the effectiveness with which it leads to the desired specific action. No amount of care in framing a solicitation so as to catch the eye, to hold attention, and to stick in the memory, will be worth the trouble if the reader's reaction does not go beyond the appeal itself, and include the article which the appeal announces. Granted, then, that the first three tasks have been adequately performed, what are the principles which control the direction, the certainty, and the force of the response?

Obviously there are two cases to be considered here. First, the case in which the appeal is addressed directly to the life of feeling, impulse and instinct—what we have called the *short-circuit appeal*—and, second, the case in which deliberation, comparison and argument are invited—the "reason why" appeal by means of the *long circuit.* In the first case there is no conflict or

rivalry stirred up in the reader's consciousness; there is simply the attempt to present the article in such a way as to provoke some firmly grounded act of appropriation, to stir up some strong impulse or keen desire and so to lead to favorable action. In the second type conflict is, on the contrary, even encouraged. Selling points, superiorities, advantages, etc., are advanced, and the claims of rival commodities deliberately challenged.

It will be difficult to speak in terms of general laws here, and yet to remain concrete. Conditions will vary according to the article, the reader's temperament and need, local influences, habits and customs. The result is that this is one of the most promising fields for further research in applied and practical psychology. Some of the experiments that are already in progress in the field of advertising will be reported in the chapter on the experimental method. But there is a certain group of principles which can be clearly stated and applied on the basis of what we already know of mental processes in the life of action. These we will take up in turn. Our chief concern will be with the laws of suggestion and with our earlier question concerning the appropriate use of long and short circuit appeals.

DIRECT APPEALS TO FEELING

Short Circuit Action Without Conflict.—We may distinguish two general types of short circuit appeal:

(a) The appeal through command, assertion, invitation, either direct or indirect. Such an appeal will owe its force to the degree to which it conforms to the *laws of suggestion.* At this point, then, these *laws of suggestion* must come in for their share of discussion.

(b) The second type will be the appeal to some definite instinct, or other strong and certain form of reaction. Success here will depend chiefly on the strength and promptness of the instinct to which the appeal is made. Here, then, will be the place to consider the topic to which we have so frequently referred, but as often postponed for later discussion, viz., the question of the relative strength of the various human instincts, and their dependence on such factors as age, sex, class, occupation, training, the commodity in question, etc.

THE NATURE AND LAWS OF SUGGESTION

No little mystery has come to invest the word "suggestion," chiefly because of its constant use

by pseudo-scientific writers in their attempts to develop dramatic interest in the extreme suggestibility of certain states of drowsiness, abstraction, fatigue and hysteria. But there is no more mystery here than there is in any of the simple mental processes along the nervous arc. The fundamental law is that of *ideo-motor action.*[1] In the earlier discussion of the nervous basis of mental processes, we pointed out the law that *every sensory impulse has its inevitable motor issue.* The nervous energy generated or liberated by a stimulus emerges at the other end of the arc in the form of action. This action is usually directed toward the stimulus itself, in the form of movements of appropriation or rejection. Sometimes, however, the response is not so apparent, when, for instance, it takes the form of general bodily attitude, changes in breathing, heart beat, gland action, vascular changes, or general rigidity or tension of muscles. Moreover, the strength of the reaction need not be exactly proportionate to the strength of the stimulus. Sometimes the energy may be drained off into other channels that are active at the time,

[1] The psychological reader should not confuse the law of ideo-motor action, as here presented, with the doctrine that the cause of a voluntary movement is a kinæsthetic image of that movement.

and the value of the response will then be obscured. Again, the direct response may itself drain off energy from other pathways, and its strength be relatively increased.

Closely connected with this law of the inevitable motor issue of sensory impulses is a correlate law which concerns mental processes that do not have an immediate sensory cause. In the section on Imagination we have seen that we may have ideas and images even when there is no corresponding activity of the sense organ. These processes are then due to what we may call the spontaneous activity of the brain centers. This spontaneity, however, will only mean independence of a *corresponding* sensory impression. But the activity will usually be seen to be caused by virtue of the association of the center in question with some other center whose previous activity has stirred it up in what seems to be a spontaneous way. Often the activity is due to some present sensory impression, which, however, does not *correspond* in character to that of the spontaneous image or idea. Frequently this impression is simply a word—the auditory impression of syllables spoken or the visual impression of a written or printed word. The word center is closely associated with the sensory center which

is involved when we actually perceive the object which the word denotes or means. Hence, activity from the word center overflows into the object center, and the result is an apparently spontaneous image, picture, or idea of the object or act which the word suggests.

Now these so-called spontaneous nervous processes have their tendency to motor issue, just as do sensory impulses. *Every idea of a situation tends to produce movements calculated to handle that situation.* This happens just because the discharge of energy from brain center to motor apparatus has become a habit. Constant practice has set up ready paths of discharge between ideational and motor centers. Thus I do not have to deliberately trace out the form of these letters as I write. I simply think the word and, by fixing my attention on the point of the pencil, guide it in straight lines across the page. But the letters form themselves. The simple idea of the word carries itself out into the act of writing it. The interesting and, to the uninitiated, mystifying performances of the planchette, the Ouija board, the automatic writer, the muscle reader, and similar phenomena have been clearly shown to be due to this motor issue of conscious

or subconscious ideas and images in the mind of the experimenter.

Ideas and images of objects, persons and situations tend just as strongly to set up responses calculated to adapt the organism to the particular object, person or situation thought of. Think intently of your cravat, and you will find yourself fingering and adjusting it. Concentrate on the choice cigar in your pocket, and you will likely search at once for the match box. Vividly recall the pleasant languor of a warm bath or the tremendous wind currents of lower Broadway and you will find yourself either stretching out your legs, closing your eyes and reclining in your chair, or, as the case may be, ducking down into your coat collar and clutching your hat brim; and the more you attend to the idea in mind the more completely will its motor issue be realized. If you attend strongly enough you may find the idea amounting to an hallucination—that is, you act just as you would in the presence of the actual object.

This, then, is the fundamental law of ideomotor action, and the basis of what we sometimes call suggestion. *Every idea of a function tends to realize itself, and will do so in so far as it is not inhibited by rival ideas or impeded by physi-*

cal circumstances. Whatever tends to clarify or intensify the image or idea tends to precipitate the act. This is what was meant in the fourth chapter, when it was said that "attention is the basis of every act of will." An idea, once introduced into consciousness, derives its "will power," its action strength, from the degree to which it can completely dominate consciousness. This domination will depend partly on the intrinsic intensity and impulsiveness of the idea, partly on the degree to which it is reinforced by inner processes—attention, ideal, etc. Other things being equal, this power depends on the amount of attention the idea receives.

When such an idea originates more or less directly or spontaneously in the mind of the actor, we call it an *intention,* a *purpose,* an *impulse,* etc. When its origin can be traced further back to some more or less obvious external source, a picture, a command or an invitation of a second person, the behavior of another person or group of persons, etc., we call it a *suggestion.* Suggestion, then, is no more a mystery than the fact that I can speak or write my thoughts, button my coat or sharpen my lead pencil at pleasure. But just as there are certain laws which experiment and general observation show to control the maximum

efficiency of voluntary action, so there are certain conditions on which the action power of suggestion depends. We shall enumerate the most important of these conditions and illustrate them by examples in the field of advertising.

THE LAWS OF SUGGESTION

1. *Decision* is only another name for the final outcome of the rivalry of competing ideas. *It is, then, important, in appealing over the short circuit for a specific line of action, not to suggest interference, not to suggest an opposing action, a substitute, a rival idea.* Any such suggestion will simply impede the action power of the first idea, by inviting comparison and making necessary a more or less deliberate choice. This will immediately involve long circuit response, the direct appeal will be reduced to "reason why" copy, and the original purpose of the suggestion will be defeated. It is not necessary to give examples of the violation or observance of this law.

2. The strength of a suggestion will be the greater the more the suggestion appears to be of *spontaneous internal origin.* Every one of us is predisposed in favor of his own ideas. We instinctively resist encroachment, domination, ex-

ternal control. But we welcome and magnify an impulse, a tendency, a line of action that seems to have originated in our own bosom. For this reason an external suggestion which seeks maximal action power should be addressed to some present interest, personal value or universal instinct. Such appeals are not readily recognized as external and foreign. They are readily assimilated and transformed into personal intentions. Two common tendencies of current advertising take advantage of this principle. One is the tendency to give *news interest* to advertising copy. The advertisement thus easily appears as simply an avenue of information, the beseeching or the arrogant tones are lost, and the action suggested seems easily to be a quite natural and matter-of-fact intention of the reader. The other tendency is the constant use of repetition and variation. By these means the particular time and place of origin of the suggestion are lost. So long as I can say, "This or that suggestion comes from this or that advertisement," the appeal remains external and foreign. But when that same appeal has met me in a score of places and in a score of forms, the particular source fades into an indefinite and apparently universal one, a perfectly familiar one, so familiar, indeed, that the

suggestion seems to have been with me all my life, it appears to be an idea of my own, a plan which I have always harbored, and I am surprised that I have delayed its execution so long. The growing practice of signing advertising copy must certainly work against this second law of suggestion, and is hence utterly unsuited for direct appeals, though perhaps no impediment to "reason why" copy. The Hand Sapolio crusade began with the simple command "Be Clean," expressed in various forms and places. The constant presence of this injunction is said to have unconsciously raised the standard of personal cleanliness, and made a market in the locality for Hand Sapolio. Obviously if this crusade had been flagrantly conducted, or associated definitely with a given signboard or placard, the exhortation would have been resented, rather than complied with.

3. The action power of a suggestion depends, among other things, on its actual *intrinsic intensity, force and vigor.* The motor response to an image is not so strong as that to an actual impression. But the more an image comes to resemble an impression, the more intense and insistent it becomes, the stronger becomes the response. Hence the suggestion should be as definite, pointed, incisive and vigorous as it can be

while yet conforming to the second law. It should ring with confidence, certainty and conviction. The action suggested should be specific, clear and full of necessity. Thos. E. Dockrell, in a trenchant essay on this law, has pointed out its confirmation in history, literature and business, at the same time recognizing the distinction between "domination" and "arrogance"—emphasizing thereby the necessity of conforming to the second law as well as to the third. See in this connection also Scott's chapter on "The Direct Command."

4. Suggestion is most active at its *positive* pole. Whenever possible, the human mind works in terms of positives rather than negatives, similarities rather than differences, presences rather than absences. Ask a group of men to compare two buildings in height, two noises in intensity, two towns in size, two men with respect to their efficiency. Nine out of ten will tell you which is the highest, the loudest, the largest or the ablest. Only rarely will you find a man who thinks in terms of shortness, faintness, smallness or weakness. Just as association leads forward more strongly than backward, so attention, judgment and interest are drawn to the positives, the affirmatives, the similarities of the world. We say

things differ in length, strength, importance, not in shortness, weakness, insignificance. Even when an appeal is couched in negative terms, its positive suggestion is more likely to be realized than its negative. The Old Covenant with its "Thou shalt not" had to be replaced by the New Covenant with its simple positive "Thou shalt."

Münsterberg tells a story of an alchemist who sold directions for turning eggs into gold. The buyer was to hold a pan containing the yolks of a dozen eggs, and stir these eggs for half an hour without ever thinking of the word "hippopotamus." Thousands tried, but none succeeded in resisting the positive suggestion. The same writer continues: "Whether shop girls in a department store are advised to ask after every sale 'Do you want to take it with you?' or 'Do you want it sent?' makes no difference to the feeling of the customers, but may mean for the store a difference of thousands for the delivery service."

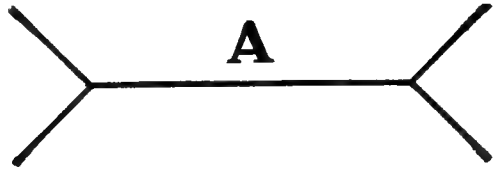
5. The strength of a suggestion will depend also on the *degree of attention* under which it operates. This law follows naturally from the second and third laws in which the importance of intensity and clearness was pointed out. If you will recall the enumeration of the laws and results of attention you will remember that the

processes attended to becomes both clearer and more intense than it would otherwise be. And since intensity and clearness influence to so marked a degree the action-power of a suggestion, the importance of attention is obvious.

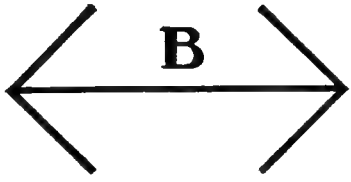
Even when the suggestion is subliminal, that is, below the threshold of consciousness, it possesses action power, and this action power will depend on the variability or constancy of the attention given to the general field in which the stimulus occurs. The writer has often been told by active copy men that the psychological subtleties in advertising are a mere pastime, since the genuine power of advertisements comes from the unconscious influence which they exert on the reader's mind rather than on any conscious mental process set up. It need only be said that in so far as there are such things as unconscious suggestions they operate according to the same laws as do suggestions of which we are keenly aware. These laws of attention, perception, interest, association, memory, choice and action apply to both with equal rigor.

One of the writer's students has recently performed experiments which clearly illustrate the dependence of even unconscious suggestion on degree of attention. It is a well-known fact that

the addition of wing lines pointing in opposite directions may change the apparent length of a base line. Thus the base line in A seems longer



than in B, although they are really of the same length. Practically everybody gets this illusion, which depends upon the strength of some suggestion coming from the added wings. Take the wings away and the lines at once appear equal. What now would be the result if the wings were



really present, but were drawn so faintly that the observer, at the distance at which he is placed in the experiment, cannot detect them, but sees only the broad strong base line? The suggestion afforded by the wings is present on the retina, but too faint and weak to come to consciousness. The experiment here referred to shows that even un-

der these conditions 17 out of 20 observers yield to the suggestion and pronounce A longer than B. Yet at the end of the experiment of 50 trials for each observer, not one of them even suspected the presence of the wings. They merely thought themselves to be judging the length of two simple black lines. Certain other investigators have reported similar results.

But some people get the illusion with subconscious wings more strongly and frequently than others. The table on page 232 shows the per cent. of the total trials in which each observer pronounced A to be longer than B. In such a table 50 per cent. will mean that no illusion is present, but that, being compelled to choose between A and B, the chances are even. But every per cent. above 50 will indicate the presence of the illusion due to the subconscious suggestion. It will be seen that only three observers have 50 per cent. records or lower, the others ranging upward to as high as 76 per cent., the average being 60 per cent.

How can we explain these striking individual differences? Comparison of these records with the scholarship record for the course of study which these people were taking at the time shows high correlation between the scholarship grade

and the illusion record. People who get the illusion strongly are the people with high grades, people with firm and steady attention habits. The people whose illusion records are low are those whose scholarship is also low. The records of the

experimenter made during the trials also show that those observers who paid close attention to the task were the ones who were most influenced by the suggestion. It follows, then, that even the unconscious influence of appeals will depend on the degree and duration of attention to the general field in which the suggestion appears.

6. The action power of a suggestion will depend furthermore on the *prestige* of its source. The currents and trends of imitation in social life are perfect examples of this law. Custom, style, innovations, always trickle downward from the higher social strata. The butler apes his lordship and the sewing girl her mistress. In logic and politics and many other places the "argumemtum ad hominem" is a dangerous fallacy. This argument proceeds by saying, for instance, that "man is immortal because Sir Oliver Lodge says he is." The more we revere a speaker for one reason or another, the greater confidence we tend to put in what he has to say on any topic whatsoever and the more prone we are to imitate him and to follow out his suggestions. In hypnotic experiments, the subject, it is said, must be *en rapport* with the operator, must have utter confidence and faith in him if the experiment is to work.

Similarly in laboratory tests of the persuasive value of different types of advertising copy, all investigators, Gale, Scott, Strong and the writer, for example, find that such things as the reliability of the firm, the reputation for straight dealing, the length of time which the firm has survived competition, etc., stand out clearly in direct ap-

peals which the experiment declares to be effective.

7. Closely related to the foregoing principle is the law that the strength of a suggestion will be determined partly by the amount of *internal resistance* which the suggestion encounters. Suggestions to violate lifelong habits, firmly fixed moral feelings, sacred relationships, are impotent even during the hypnotic trance. So in advertising, the attempt to displace habits, usages and practices of long standing by simple suggestion, affirmation or assertion, is a heavy one. The suggestion will be most effective when it can call to its aid some other interest or impulse with which it can coöperate.

8. Finally, the strength of a suggestion will depend on the *frequency* with which it is met. Impression after impression may summate themselves to produce a final intensity greater by far than any single stimulus could be. The rôle of repetition in attention, interest, association and memory we have already pointed out. And here, in the field of action, we find it to have equal if not even greater importance. No better illustration of this principle can be found than the parable of "the borrowing friend." The claims of prestige, sympathy and friendship all failed to

secure the three loaves, but persistence, simple repetition did the work. "I say unto you, though he will not rise and give him, *because he is his friend,* yet *because of his importunity* he will rise and give him as many as he needeth" (St. Luke, XI, 8).

But while repetition is effective, it is at the same time expensive, and hence should not be employed indiscriminately. Repetition should be frequent enough to keep the appeal always fresh in the memory. More than this amount is likely to be superfluous. What, then, will be the most economical distribution of repetitions? In a general way it may be said that the distribution of repetitions should conform to the normal curve of forgetting, which has already been described.

But it should be pointed out and clearly borne in mind that mere mechanical repetition avails little unless the repeated stimulus is attended to with more or less interest. For example, give some one a list of fifty words and request him to name, as quickly as possible, the opposites or synonyms of all the words on the list. Repeat this day after day until the observer has read through the list say 25 or 50 times. Then ask him to name or write down the original list of stimulus words which the card contains. You

may be surprised to learn that only ten or twelve of the fifty words can be given in three to five minutes, and that even in a quarter of an hour the observer will be unable to recall more than about half of the list. He has repeatedly read through the list, that is, mechanical repetition has been present, but he has not read with the *determination to remember,* that is, his interest has not been in the original list, but in the opposites or synonyms which he was required to give. Now give the observer a new list of words, ask him to read them through with the intention of remembering them, and you will find that after a very few repetitions he can repeat the whole list correctly. Mere mechanical repetition, that is to say, is as futile as mere mechanical intensity, magnitude or contrast. Only when repetition is accompanied by *interest* is it likely to be worth what it costs.

CHAPTER XIII

INSTINCTS, THEIR NATURE AND STRENGTH

In the history of the race certain objects or situations in the world have stood out as fundamentally important factors in the struggle for survival, for supremacy and for comfort. Further, definite kinds of response have been proven to be most appropriate in dealing with these objects. Individuals who have reacted promptly and definitely in these appropriate ways have been successful, have flourished, and have left descendants who possessed the same inborn tendencies to reaction. Individuals who for one reason or another failed to react in these appropriate ways perished. The result has been a constant selection of those individuals who possess more and more firmly the natural mechanical tendency to react in the way which race history has proven to be appropriate. These reactions in their finally developed form are called *instincts.*

We may look upon the *instinct* as a very complicated *reflex action.* Just as the eyelid reflexly

blinks when a blow is struck, without the volition of the owner, so the organism behaves reflexly in definitely useful ways in the presence of certain kinds of objects. The sight of one boy sets up the pugilistic attitude on the part of another. The presence of her child leads the normal mother to varied acts of caressing, nursing and protecting. The discovery of a rich gold deposit attracts men from all parts of the world, who dig out ore and hide it away in secret places, just as a bird hides pieces of twine, a water rat all manner of stray objects. The discovery of a remedy for a hitherto incurable disease sets all the world a-talking and a-buying.

These actions we say come so promptly and universally because of the common *instincts* which men possess, instincts of pugnacity, rivalry, maternal love, accumulation, acquisition, self-dependence, curiosity, play, construction, economy, sympathy, imitation, family affection, social co-operation, display, sexual mating, hunting, hospitality, civic and national pride, leadership, etc., etc.

From the point of view of the advertiser, the important thing is that if an appeal can but touch off one of these instinct mechanisms it is sure of at once possessing attention power, interest,

imagery, association and memory value, and is extremely likely to set up strong response. And the stronger and more universal the instinct, the greater the likelihood of its effectiveness. Most articles can be described so as to appeal to any one of a wide range of instincts. Thus an ordinary article, such as a clothes-dryer, can be emphasized as cheap, as safe, as popular, as home-made, as amusing, as clean, etc. An advertisement of the Hill Clothes Dryer, wretchedly constructed from the artistic point of view, nevertheless presented an argument which appealed strongly to the universal interest in bodily safety. In an experiment on the relative persuasiveness of 75 subway cards the writer found this card to be unanimously the most convincing of the series. And he is informed that the copy has produced gratifying results from the point of view of sales.

Twenty years ago advertisements failed to recognize the specific character of instincts; appeals tended to be of a vague, generalized sort which in our day would pass unobserved by a busy public. But the present practice is more and more to recognize the specific instinct as a basis of appeal, and to concentrate the appeal strongly on a single instinct rather than to distribute it among many. The following pairs of advertisements reprinted

from *Advertising and Selling* clearly show this tendency. Compare the vague, generalized copy of 1890 with the definite pointed appeals of twenty years later.

We shall take up, in a moment, the question of the relative strength of these specific instincts as

1890—

1910

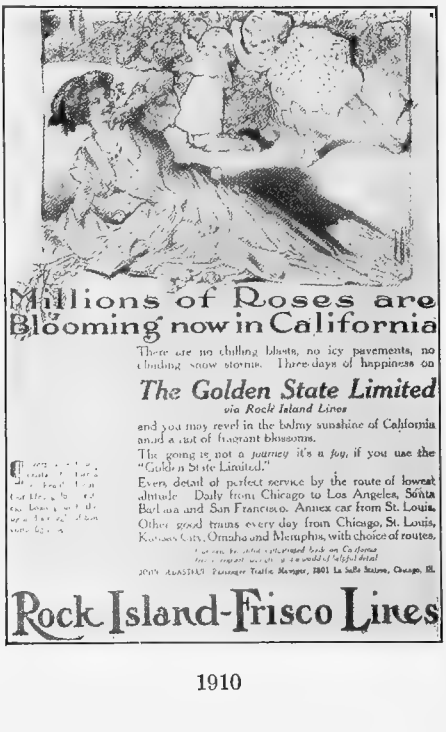
a basis of appeal in advertising. But before passing to this problem, it is necessary to point out another important group of factors, which, while they can scarcely be called instincts, yet closely resemble them in character. The instinct we are born with. It is the result of the experience of our ancestors. But during our own lives

we all come to acquire certain other prompt reactions to the particular things in our experience.

1890—

Thus, the moment a thing can be demonstrated to be *chic,* stylish, nobby, modern, popular, clean, artistic, imported, scientifically made, guaranteed, elegant, socially advantageous, progressive, gentlemanly, bohemian, refined, sporty, up-to-

date, used by some favorite, etc., etc., it will at once find a market of greater or less extent and permanence.

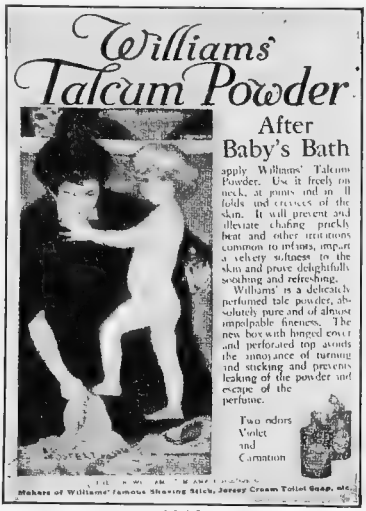


1910

Let us call these ideas *effective conceptions.* The general law is: Besides our instinctive actions our conduct roots largely in a few fundamental conceptions, ideas, values, standards, which we apply as action criteria. The moment

an appeal, a suggestion, an object, can be classified under one or other of these headings, our attitude toward it is determined. Throw an atmosphere of elegance, of style or of healthfulness

1890—



1910

about clothing, breakfast foods, soaps, musical instruments, etc., as the case may be, and the reader will at once react to it by "short circuit" response, either favorably or unfavorably, according as the conception used is in his particular case *effective* or *weak*. Since these *effective conceptions* are in their action similar to *instincts*, we may group the two together in our attempt to learn how these differ among themselves in

strength and action-power, how these differences vary with sex, age, class, occupation, commodity, etc. We must say to begin with that this is at present a field which is almost unworked experimentally. General comments and opinions are abundant, and they are just about as reliable as such random observations usually are. The experimental results which we shall report will, then, represent pioneer investigations of their kind, and must be held subject to such modification and correction as later investigation shall suggest.

So far we have emphasized only the principles controlling the direct appeal to "short circuit" response. There remains yet the "reason why" appeal to comparison, argument and deliberate choice, to the "long circuit" action of reason. It is evidently impossible to say in general terms what sorts of arguments, what methods of reasoning, what sort of "selling points" or "reasons" will be effective. These facts will vary with the type of article advertised, with the type of man appealed to, and with the actual points of superiority which the goods may chance to possess. But it may be said that even in our reasoning it is the appeal to *our own* point of view, *our own* dominant instincts, conceptions, values,

habits and needs that constitutes the most effective argument. The answer to the question of the relative value of types of argument, selling points, etc., may then be left to the experiments which are to follow.

Since the short circuit appeal is based on the fact that human beings are equipped with certain instinctive tendencies to react in definite ways toward particular objects or situations, it follows that this type of appeal is particularly adapted to the case of certain commodities—to those types of articles toward which or toward the use or services of which we react with promptness, certainty, and feeling. And since acquired habits come to resemble instincts in these respects, we may include both habits and instincts as the basis of the short circuit appeal. In a general way we may say that the following principles are true.

The short circuit appeal (display advertisement, appeal to instinct, feeling and habit) is well adapted:

1. For all *personal* articles, the use of which is *intimate* and *private,* as toilet articles, gifts, stationery, etc.

2. For articles of *luxury, display,* and *adorn-*

ment, as jewelry, fancy dress goods, feathers and plumes, flowers, etc.

3. For articles enjoyed *in themselves* or *for their own sake,* rather than for remote service which they may render, as drinks, musical instruments, sweetmeats, toys, etc.

4. For articles calculated to promote the *bodily safety* of the individual or of those dependent on him, as disinfectants, safety devices, insurance, weapons of defence, etc.

5. For *all food products.*

6. For all clothing which tends to be ornamental rather than utilitarian in character, as ties, collars, laces, canes, etc.

The long circuit appeal (reason why copy, argument, comparative statement of advantages, etc.) may also be used to reinforce the strength of many of the short circuit appeals used in such cases as those just enumerated. But it is especially fitted, by its nature and by the way in which it will be reacted to, for articles which are the reverse of these in character; for articles which are in themselves, or from the use to which they are put, impersonal, utilitarian, instrumental; and for articles which are intended not so much to fill present needs only, but also to create new needs or desires—such articles as books, plows, buttons,

hammers, trucks, etc.—in general, to those things which partake of the nature of a *tool.*

It is further true that not all instincts are equally strong, not all habits equally coercive. This being the case, information concerning the relative strength of various possible appeals to interest, attention, instinct and response tendencies is desirable. To men who desire to make their copy or their selling talk effective, and at the same time economical, the question of the relative strength of appeals, instincts, interests and effective habits is a live one. The writer has repeatedly been asked by such men to state the relative strength of various appeals in the case of the average man—to say in how far certain interests are universal, to what degree certain general types are pronounced, and how they are distributed and conditioned by age, sex, race, etc. The practical man expects the expert psychologist to possess such information, and he has the right to expect much more than we are at present able to tell him.

Only one or two fragmentary attempts have been made to answer such questions experimentally. Thus Harlow Gale studied a series of soap advertisements by the method of questionnaire and voluntary introspection. His results,

when worked over into terms of relative position, would yield some such result as the following. The smaller the number the higher the position, hence the stronger the appeal.

TABLE XIII

Appeal	Relative Position	
	Men	Women
Purity by government's test	2.46	2.29
Old firm	2.68	2.11
Home industry	3.22	3.49
"Attractiveness"	3.50	3.49
Special sale	3.68	4.06
Souvenir prize	4.62	3.47

The manager of a western magazine, as reported by Scott, secured thousands of replies from readers as to which advertisement for a given month had interested them most, and why. The following table resulted:

TABLE XIV

Reason	Number of replies
Reliability of firm or goods	607
Money considerations, cheapness	508
Beauty of the advertisement	418
Presented goods needed at the time	408

Obviously such meager and generalized results are of little value. What is needed is a series of

TABLE XV

Table shows the result of an experiment, in which the appeals were specifically stated to be advertisements of BREAKFAST FOODS. These appeals were also arranged by fifty persons, and the table gives the average for the fifty. No pictures were used in these appeals, the words alone serving to direct the appeal to the special interest or instinct concerned. The second column gives the Probable Error of the average. Thus, taking Doctor's Recommendation as a sample, its average is 7.5, and its probable error .5. This means that the value is not absolutely 7.5, but may go up as high as 7.5–.5 or 7.0, or that it may go down as low as 7.5+.5, or to 8.0. The numbers in each case indicate the average value in a series of twenty appeals, the smaller the number the stronger the appeal.

rigorous test experiments, under conditions which are constant, and by methods which will afford comparative numerical measures.

Strong has reported experiments designed to determine the relative value of various arguments in favor of a given type of commodity by securing typical advertisements of such articles and using the methods which were referred to in the first chapter of this book and which are to be described in detail in the chapter which is to follow. His studies include such special articles as vacuum cleaners, pianos, breakfast foods, and soaps. An interesting presentation and interpretation of his results is given in his doctor's dissertation on "The Relative Merits of Advertisements." The preceding tabulation of the results of the series of breakfast food appeals will serve as an example of the suggestive information which such experiments yield.

Studies of the sort reported by Gale, Scott and Strong (some of Strong's experiments have been subsequently repeated and confirmed by Starch, with clothing advertisements) are especially useful as pointing the way toward the possibility of a complete exploration of the range of human interests and instincts. In the following chapter will be given an account of such an attempt, which

in point of time antedated the experiments of Strong and Starch, but which logically follows upon them. We shall there present a series of measurements which apply, not to special articles, but to all articles in general, arranged in such a way that the relative value of various appeals for any specified commodity may be approximately determined by reference to the larger table.

It should be said here that we are not interested, in this connection, with the strength of the various instincts and interests in phases of life other than that of the business transaction. Nor can knowledge of the strength of the various instinctive tendencies as they display themselves in the home, the school, or in sport, serve as a basis for determination of the strength of the same instinctive tendencies when they constitute reactions to business appeals. Thus one might be exceedingly vain and much concerned with his personal appearance in a general way, and yet mistrust appeals in the way of advertisements and selling talks based upon such an instinct. One might be sedulously careful of his health, so far as his own activity might be concerned, and yet mistrust assertions of the health-promoting qualities of any advertised article of commerce. And

an individual with strong imitative tendencies with respect to his general behavior might yet refuse to adopt a given article or style of dress merely because some favorite opera singer or public official had recommended it.

CHAPTER XIV

THE RELATIVE STRENGTH OF THE CHIEF INSTINCTS AND INTERESTS

Before taking up the main topic of this chapter, it will be well to consider in some detail the method by which the results here presented were secured. We have frequently had occasion to refer to methods of measuring the strength of such subjective things as the strength of appeals, the persuasiveness of advertisements, etc. How, now, is it possible to measure these subjective factors, so long as there is no objective scale with which they may be compared? A few illustrations may throw light on the problem.

Suppose that I have in my laboratory a series of weights which differ from each other by very small amounts. Suppose, further, that I desire to know the relative weight of the members of the series, but have no balance with which to weigh them, and that the differences between those most like each other are so small that I cannot absolutely trust to my judgments when I lift

the weights in my hand and compare them with each other. I may be led to mistrust my judgments because I do not always judge consistently, or because the judgments of other people in the laboratory disagree somewhat with mine. These conditions being given, is it possible for me in any way to determine with certainty the order of the weights as that order would turn out if a balance were available? The answer is that it is not only possible, but at the same time very easily accomplished. All I need to do is to let a large number of people, say twenty different individuals, arrange the weights in what seem to them to be the order of their relative heaviness, when lifted in the hand. Then taking the average of the twenty judgments of each weight in the series, I derive a final order based on the combined judgments of the twenty observers. This final order will be found to coincide with the order of heaviness as determined by the balances, when such are available. Anyone who doubts may easily satisfy himself by trying the experiment. If there are, say, seven weights in the series, and five different individuals pass judgments upon them, some such table as the one on page 255 will result:

The order of heaviness, as determined by the judgments of the group of observers, is seen to

afford a correct statement of the real relative heaviness of the series of weights. The objective scale (the balance) is unnecessary. We have used it here only in order to check up the order as de-

TABLE XVI

Typical Table Resulting from Order of Merit Method

The Weights	Position in order of weight, as judged by five persons					Average Position	Order of Heaviness
65 grams	7	6	7	7	7	6.8	1
63 grams	6	7	6	6	5	6.0	2
61 grams	4	5	4	5	6	4.8	3
59 grams	5	4	5	3	4	4.2	4
57 grams	3	2	3	4	3	3.0	5
55 grams	1	3	2	2	1	1.8	6
53 grams	2	1	1	1	2	1.4	7

termined by the judgments. In the same way it is possible to determine the order of intensity of a series of sounds, the relative legibility of specimens of handwriting, the relative length of lines differing only slightly from each other, the relative excellence of literary compositions, the relative eminence of scientific men, the relative persuasiveness of selling talks, the pulling power of advertisements, the strength of various appeals to instincts and interests.

It must be noted that in the experiment on the series of weights, I do not ask my observers to arrange the weights in the order in which they think

they would appear to some other individual, nor in the order in which they think they would appear to people in general, nor even in the order in which they think the weights would be shown to stand when measured on the balance. I instruct each individual, "Arrange the weights in the order of heaviness as they seem to you when you consider them. Arrange them in the order in which they affect you when you lift them." Similarly, if I am studying a series of advertisements, I do not say: "Arrange these appeals in order according to the way in which you think they would affect *other people,*" but I say: "Here are a series of appeals. Arrange them in order according to *the degree to which they make you desire the article,* or interest you in it, or incline you favorably toward it." That is to say, I do not ask him to judge whether or not the various appeals are *good advertisements* (persuasive to people in general). Similarly, if I am studying a series of landscapes, I do not ask my observers to arrange them in the order of beauty as they think other people would be affected by them. I merely say: "Which picture is most beautiful *to you?* Put it at the top. Which of the remaining ones is most beautiful? Put it next in order, etc." But my *final* orders of merit *will* represent the

way in which people as a whole, in general, on the average, or in the long run, will react to the objects studied. Or if any objective measurement is possible, the final order will coincide with these objective measurements. In other words, the determinations afforded by the experimental methods are *true measures* of the qualities or traits investigated.

This is the method which was used in measuring the relative pulling power of the different series of advertisements discussed in the first chapter of this book. And it was there shown that the results of the laboratory tests actually enabled us to know in advance the relative order of pulling power of the advertisements when they were used in business. It should be said further, that, by the use of the proper precision and statistical method, it is not only possible to determine the relative order of these subjective factors, but to measure the *amount of difference* between the various members of the series. A discussion of these further refinements of the method would involve more technicality than it is the purpose of this book to contain. Readers who may be interested in knowing more about the method, its history, applications, and possibilities, may be referred to Strong's monograph en-

titled "The Relative Merits of Advertisements." This monograph consists of the elaboration and justification of the method here described, with applications. Thorndike's "Mental and Social Measurements" gives a useful account of the statistical and mathematical points involved in such measurements.

Having given this brief description and justification of the laboratory method, we are now ready for the results of an extensive experiment on the strength of such appeals as may be used in various business situations. In order to get at the strength of the appeal in itself, and independently of any particular article or brand in connection with which it might appear, abstract appeals have been used, which referred not to any commodity in particular, but to an ideal, imaginary article, designated by an abstract symbol, such as 3K7. The value of abstracting from particular commodities will be pointed out after the results have been given. Fifty abstract appeals, each designed to reach a definite and different interest, instinct, or line of argument, were prepared. These appeals were typewritten on separate slips of paper, and presented without being accompanied by picture or illustration. In addition to the statement of the appeal, each card bore a sin-

gle word or pair of words, designed to emphasize the specific character and direction of the appeal, to reinforce the suggestion or argument offered by the text itself, and to insure, in so far as possible, the same attitude on the part of all the observers in the presence of the respective appeals. By employing such material the following results were secured:

1. Each appeal tends to be single and uncomplicated by other interests.
2. Each is divorced from reactions to any article or brand as such.
3. The elimination of illustrations and the use of the same general style and expression lends homogeneity to the group of appeals.
4. A wide range of specialized isolated appeals is secured, which fairly represents the possible range of appeal afforded by human nature.

The series of 50 appeals was given to each observer, along with the following printed directions.

DIRECTIONS

(Read these directions two times, carefully, before beginning the experiment.)

This is an experiment in the psychology of advertising. Its purpose will be explained after you have finished the series. Each card contains an advertisement of some fictitious article, indicated by a letter-numeral symbol (thus, 3K7). It need make no difference what the article might really be. It may be well to assume that all the cards advertise different brands or makes of the same article,—some ideal, imaginary article, to which any or all of the advertisements might apply.

I. Read all the advertisements through and arrange them in five consecutive piles, in an order of merit,—according to their *persuasiveness, i. e.,* according to the degree in which they make you *desire* the article or *convince* you of its merit.

There will thus be five degrees of *persuasiveness,* which might be roughly designated:

1. Most persuasive.
2. Very persuasive.
3. Fairly persuasive.
4. Mildly persuasive.
5. Least persuasive.

Arrange the five piles in a row so that Group 1 is at the top, Group 5 at the bottom, and the three other

groups in their respective positions between these extremes.

II. Having done this turn to the top pile (Group 1) and arrange the advertisements in that group in a strict order of merit,—the strongest in the pile thus getting the first position, the next strongest the second position, and so on.

After the top pile is arranged, treat each of the other groups in the same manner. In this way the whole series of advertisements will have been arranged in an order of merit series with respect to their *persuasiveness*,—with the *most persuasive* at the top and the *least persuasive* at the bottom.

III. Without disturbing your arrangement of the Groups, notify the experimenter that you have completed the series.

The 50 different appeals follow, arranged in a final order of merit for a group of 40 observers, consisting of 20 men and 20 women. The first pair of figures gives the *average value* and *mean variation* for the women, the second pair the measures for the men.

1. 1K6,—SCIENTIFIC:—Our 1K6 article is manufactured by approved scientific methods and by scientifically tested processes, by technically

trained men, working under the constant supervision of experts.

2—9.1; 2—8.4

2. 1W5,—DURABILITY:—Combine utility with durability by using 1W5. It lasts one-third longer than the ordinary article. Stands the wear and tear of constant use, combining equal quality with greater permanence and longer service.

1—8.2; 6—8.0

3. 1F3,—SANITARY:—This is the only sanitary 1F3 on the market. Put up in germ-proof, dust-proof, hermetically sealed packages, and made of strictly pure and unadulterated ingredients.

5—7.7; 3—10.5

4. 2D8,—EFFICIENCY:—Actual energy, earning power, is what counts in modern business. The day is past when recognition rested on pull and social influence. 2D8 will increase your efficiency 25%. By no other means can you secure such prompt and sure increase of producing capacity.

7—12.8; 8—13.7

5. 1T8,—TIME:—Save the minutes and the hours will save themselves. Time is money. Our latest 1T8 is the biggest time saver on the market. Does in twenty minutes what requires, with other brands, a half an hour.

3—8.6; 14—12.2

6. 1N6,—APPETIZING:—Try 1N6. It comes fresh from the field and its appetizing flavor is a treat to the palate. It makes a dainty breakfast, a delightful luncheon, and a delicious dessert.

13—8.9; 5—8.8

7. 2B7,—FAMILY AFFECTION:—A final day must come to every man, and no one wants to see his children left dependent on mere accident. You owe a duty of provision and foresight to your family. A 2B7 will guarantee this comfort and security when you are gone.

17—13.5; 1—7.7

8. 1Z5,—VALUE:—Absolutely superior quality and finer finish. 1Z5 may cost a little more, but it's worth the difference. One trial will convince.

4—7.3; 16—10.1

9. 2L7,—EVOLUTION:—Our latest 2L7 is the result of generations of experience and experiment. After years of trial 2L7 stands distinctly in a class by itself as the final product of a long evolution,—the climax of mechanical genius.

11—10.9; 12—9.1

10. 2C8,—AMBITION:—There's always room higher up. Capable leaders are always in demand. Why stay among the incompetent when 2C8 will bring you a better position and increase your salary. The man who uses 2C8 is sure of recognition and rapid promotion.

6—10.9; 18—13.5

11. 2F6,—SELF-DEFENSE:—Forearmed is forewarned. Your life is always threatened by some lurking danger or another. With 2F6 in your home you are always secure and able to protect the rights and person of yourself and of those whose safety is your chief concern.

15—9.7; 10—11.3

12. 1R4,—REPUTATION:—Established in 1870, we have been for 40 years the leading manufacturers of 1R4 in the country.

We have the longest and most enviable record of any house, in our line, on the continent.

9—12.8; 21—12.0

13. 2E9, — GUARANTEED:—Our well-known trade-mark guarantees quality and satisfaction. All our 2E9 is strictly warranted high grade. Your money refunded if 2E9 does not accomplish all we claim for it.

10—12.7; 20—11.4

14. 1P5,—STIMULATING:—1P5 fortifies the body against the inroads of toil and disease, gives new life and vigor to tired muscles and nerves, and removes unnecessary strain and fatigue.

12—9.6; 41—19.4

15. 1V3,—SAFETY:—Avoid danger by using the only absolutely safety-built, accident-proof 1V3. Do not court danger by taking chances. This is the only 1V3 in which you get all the protection and none of the risk.

26—11.5; 7—10.2

16. 1E5,—POPULAR:—The name is on all tongues. You will find 1E5 in the ladies' dress-

ing-room, in the scholar's study, in the nursery, in kitchens of the humble, in crowded Eastern cities and on limitless Western plains. Used in millions of homes and everywhere it is on top.

29—13.2; 4—9.9

17. 2R5,—ECONOMIZE:—A dollar saved is a dollar earned. 2R5 will save you money. Why not cut down expense items and start a bank account. 2R5 will help you do it.

14—8.0; 19—7.3

18. 1Q3,—MATERNAL LOVE:—Nothing is too good for baby. 1Q3 comforts and soothes the little chap and makes of babyhood one happy play time. Assures the children's health and enjoyment.

18—11.4; 15—11.8

19. 1J4,—MODERNITY:—Strictly up-to-date design with all the latest improvements. 1J4 is equipped with every advantage and ingenious device known to recent invention.

22—8.8; 13—11.6

20. 1C3,—HEALTH:—As a general tonic, 1C3 is unequaled. It nourishes the system, enriches the

blood, builds up firm, healthy tissue and gives tone and color to the whole body. Prevents grippe and pneumonia.

8—10.9; 30—15.6

21. 1X9,—QUALITY:—Why keep on wasting money when for the price of the ordinary article you can get our own superior 1X9. Goes farther and does the work better than any other.

16—12.5; 22—9.5

22. 1A7,—ELEGANCE:—Nothing contributes so strongly to the luxurious comfort of the modern home as 1A7. Its presence gives dignity and elegance to the whole and creates an atmosphere of daintiness and distinction.

30—10.9; 11—10.3

23. 1G2,—BARGAIN:—No 1G2 was ever offered before for the money. As good as any others and only two-thirds their cost. We are enabled to offer this proposition only by virtue of our mammoth plant and enormous capacity. Why pay more?

28—11.0; 17—12.0

24. 2Q7,—SYMPATHY:—Kindness is the first law of humanity. Much of the pain and discomfort inflicted on dumb animals could be relieved by using 2Q7. Be humane to your beast. Use 2Q7.

37—15.3; 9—9.9

25. 2O8,—NECESSARY:—You cannot afford to do without 2O8. It is indispensable in your home, in your business, in your recreation. Every man, woman and child needs it constantly.

20—8.2; 27—14.0

26. 2W8,—MIDDLEMEN:—Why pay middlemen's profit? Buy direct from the manufacturer and keep the profits yourself. We make 2W8 and ship straight to the consumer.

23—11.7; 26—10.4

27. 2Z7,—COURTESY:—Nothing is more discourteous than an offensive breath.

2Z7 cleanses the system, purifies the blood and sweetens the breath.

27—10.1; 25—12.0

28. 2T9,—REMARKABLE GROWTH:—The superior quality of 2T9 is demonstrated by the rapid development of our business.

Total	Capital,	1890,—	$15,273.00
"	"	1895,—	85,896.00
"	"	1900,—	240,142.00
"	"	1905,—	703,279.00
"	"	1910,—	3,875,639.00

19—16.3; 36—11.5

29. 1S6,—AMUSEMENT:—Don't look bored! Buy 1S6. The most side-splitting, mirth-provoking novelty ever devised. Amuses old and young. Affords fun and laughter from morning till night.

34—10.7; 23—10.6

30. 2X4,—HOSPITALITY:—Don't be content with envying the successful hostess when you can secure the same keen pleasure for yourself. The homes equipped with 2X4 are known far and wide for their generous comfort and open hospitality.

24—8.0; 34—11.0

31. 2Y9,—YOUTH:—The fountain of eternal youth has never been discovered, but it has been demonstrated beyond a doubt that 2Y9 restores youthful vigor, quickens the step and gives new life to both body and mind.

24—8.9; 34—13.1

32. 2V7—HUNTING:—Just the thing for the fishing and hunting trip. Ensures a lively spirit in the field and solid comfort in the camp. No vacation outfit is complete without 2V7.

31—12.1; 28—11.6

33. 1O9,—SOCIAL STANDING:—The use of 1O9 is the stamp of the gentleman. It is always found where social standards are high, and is the favorite of men and women of discriminating taste and culture.

38—9.0; 24—12.6

34. 2S8,—ENORMOUS:—We have the largest establishment engaged in the production of 2S8 in the United States.

Capital, $12,000,000.00.

Factories or branch establishments in every prominent city in the country.

25—14.6; 38—11.4

35. 1Y2,—CHEAP:—Buy 1Y2. Costs just one-half the price of its competitors. Why spend two days' wages when one day's work will bring our high-class article to your home?

32—10.1; 33—9.6

36. 2J9,—GET THE GENUINE:—Avoid substitutes. Many may pattern after us, but none can equal us. As a matter of fact 2J9 has many imitators, but there is only one standard, genuine article. Ask for 2J9.

21—12.0; 48—9.4

37. 2P6,—PROGRESS:—Don't be a dead one. Use 2P6 and be up to date. It is an essential part of every progressive modern establishment.

40—11.7; 29—12.3

38. 2A3,—SALE:—We are closing out our large stock of 2A3 at a great sacrifice, to make way for next year's goods. For the next ten days 2A3 will be sold at less than cost. Come early. Don't miss this rare opportunity.

41—11.3; 31—11.7

39. 2M5,—EXCEL:—Don't be a wall flower. Use 2M5 and you will be the envy of all your friends. It gives that look of superiority which everyone recognizes and respects, but which few possess.

36—11.7; 42—13.0

40. 2K4,—CIVIC PRIDE:—We appeal to your civic pride. 2K4 is made in your own city, by

local workmen and backed by strictly home capital. Encourage home industry. Use 2K4.

33—15.0; 45—10.3

41. 1H9,—PATRIOTISM:—Our 1H9 product is made for American consumers, of strictly American-grown materials, by an American firm employing exclusively American labor and American capital.

35—15.6; 43—10.3

42. 2G4,—UNION MADE:—We stand for organized labor. 2G4 is a strictly union-made product, built by union labor, of union-raised material, and sold exclusively by all union dealers.

49—14.6; 32—11.6

43. 1M8,—RECOMMENDATION:—Here's what the world-famous tenor of the Metropolitan Opera House says of 1M8:

"I have used your product constantly and have continued to derive great benefit from it."

(Signed) ENRICO CARUSO.

46—14.0; 37—14.5

44. 1D8,—NOBBY:—Our 1D8 products are made by our smartest designers, especially for those

who love nobby and dressy styles. Exclusive patterns and dashing cuts, unequaled in snap and color.

48—7.3; 35—10.3

45. 1B5,—STYLE:—Our new 1B5 is fresh from the center of fashion, representing the latest creation of accepted artists of style, in exclusive designs and dressy patterns, *chic* and strictly *à la mode.*

47—5.8; 40—7.5

46. 1L7,—ROYALTY:—1L7 will be found in most of the houses of European royalty. We are commissioned by official warrant to supply 1L7 to his Excellency, the Emperor of Germany.

50—8.5; 39—12.1

47. 2N7,—ADMIRATION:—Do you desire the admiration of those you meet? Use 2N7 and you will be the constant center of attraction to adoring and envious eyes. No jewels or marvels of costuming can add so much to your appearance as 2N7.

43—9.4; 47—11.5

48. 2H8,—IMPORTED:—All 2H8 products are strictly imported and foreign stamped. 2H8 comes straight from European makers, and its superior quality is thereby guaranteed.

45—10.0; 46—9.8

49. 1U4,—BEAUTY:—Are you as pretty as you might be? No one wants to be homely. The continued use of 1U4 removes the undesirable blemish, beautifies the complexion, renders the form attractive and gives charm to the figure.

42—8.9; 50—9.8

50. 2U3,—PERSONALITY:—Everyone desires to be attractive to the opposite sex. 2U3 will give you distinctive presence and engaging personality which is irresistible in its appeal.

44—10.9; 49—19.2

Certain sources of "error" in such an experiment are at once obvious:

1. It is difficult to keep out of even the abstract appeals some suggestion of special reference. Thus the appeal to *appetite* will inevitably suggest food, some *health* appeals are strikingly medicinal in tone, and doubtless in most cases there is a more or less pronounced tendency to think of one article rather than another.

2. There is a certain feeling of self-consciousness and reserve in submitting honestly to such an experiment, a tendency to place low certain appeals which really bulk large outside of the laboratory, or a tendency toward ideal arrangement strongly suggestive of the inclination to give learned responses in association tests.

Of these two sources of error, it may be said that from the practical point of view only the second is of importance. And that the danger here is minimal is attested by the fact that the results of such tests are verified by keyed results. The observers used were 30 women, mostly Juniors in Barnard College, taking their second year's work in psychology, and 20 men in Columbia College of corresponding age and class. Twenty of the women made two arrangements, one month apart, without meanwhile having seen the cards. The other 10 women and the 20 men made but one arrangement. No time limit was given. Each observer was allowed to work over the material until a satisfactory order had been secured.

Comparison of the two trials of the group of 20 women will thus throw light on the permanence of such judgments and on the constancy of different individuals. Comparison of this group with

the group of 10 women will show how far the average judgments of such an experiment are typical of the results to be expected from observers of approximately the same class. Comparison of the group of men with the group of the women will reveal such sex differences in these traits as may be present. Separate study of each group will show the degree of variability introduced by the personal equations of the various observers, the general relationships of individual judgments to group averages, etc. The array of figures yielded by such an experiment is a veritable mine of suggestions and material. These results from the point of view of the applied psychologist merit discussion in detail. For the present, however, we must limit ourselves to giving the various tables of measures and briefly summarizing their meaning and significance for advertising and selling.

The table gives a statement of the relative persuasiveness of the different appeals for men and women, their average values and positions. In this table the various cards which might be classed under one general heading, such as *health, reputation, economy,* etc., have been grouped and their average taken as representing the most probable value of that general type of

appeal. The second column in the table gives, for each general type, the number of actual cards

TABLE XVII

Relative Persuasiveness for Men and Women

Appeal	No.	40 Final		20 Women		20 Men	
		Av.	Pos.	Av.	Pos.	Av.	Pos.
Health	3	4.0	1	5.0	2	3.0	1

Hospitality	1	29.0	22	24.0	16	34.0	21
Substitutes	1	34.5	23	21.0	14	48.0	28
Clan Feeling	4	41.0	24	40.5	24	41.5	25
Nobby	2	42.5	25	47.5	28	37.5	23
Recommendation	2	43.0	26	48.0	29	38.0	24
Social Superiority	4	44.0	27	41.2	25	47.0	27
Imported	1	45.5	28	45.0	27	46.0	26
Beautifying	3	45.8	29	43.0	26	48.7	29

averaged to give the result in the table. Since this number varies from 1 to 5 the reliability of the various measures is not uniform, but the method reduces to a certain extent the influence of the particular way in which one or other of the various appeals may have been expressed.

Columns 3 and 4 give the final averages and positions for the combined groups of 20 men and 20 women. The values range from 4.0 to 45.8, these numbers indicating the average position in the list of 50 possible places. The group of appeals, as a whole, falls into *three rather sharply defined sections,* the series breaking at values 15.2 and at 29.0, at which points there are wide gaps, which contrast with the gradual transitions of value within the groups. And these sections, moreover, correspond to qualitatively different groups of appeals.

(a) *In the first group,* with values ranging from 4.0 to 15.2, fall the appeals to health, cleanliness, scientific construction, economy of time, appetite, increase of efficiency, safety, durability, quality, modernity, and family affection. The general characteristic of these appeals is that they are *strictly relevant* in tone, describe the article precisely or point out some *specific value,* quality or "selling point" which it possesses.

(b) *In the second group,* with values ranging from 21.1 to 29.0, fall the appeals based on the general reputation, guarantee or assertion of the manufacturer, and on the set of specific and more or less social feelings and interests, such as sympathy for others (not family), courtesy, imitation, elegance, hospitality, sport, cheapness, etc. The characteristic of these appeals is that they *do not relevantly describe the article,* but try to *connect the article with some specific instinct or effective conception.* And these appeals are distinctly less personal, *more social,* than those of the first group.

(c) *In the third section,* with values ranging (with one exception) from 41.0 to 45.8, fall the rather vague appeals to avoid substitutes, to civic pride and clan feeling, social superiority, recommendation, the ideals of fashion and foreign origin, and finally the beautifying appeal. The chief characteristic of this group seems to be that while, as in the second group, *the statement is semi-irrelevant or incidental, the feeling appealed to is indeterminate and general.*

The only considerable sex differences, cases in which the difference in position is, say, 5 places or over, are on the appeals entitled *appetite, safety, nobby, family affection, sympathy, elegance* and

recommendation which are placed higher by the men and on *time saved, guarantee, medicinal, substitutes, efficiency, durability, quality* and *hospitality,* which are placed higher by the women.

In an interesting continuation of this experiment five professional advertising men arranged the series of appeals in an order, not as they appealed to them, personally, but *as they judged they would appeal to the general reader and consumer.* This was done in order to see how accurately the expert advertising man could judge the feelings of his audience. The final average order, as arranged by these five experts, was then compared with the orders as arranged by the 20 men and the 20 women. Several interesting points resulted from this comparison.

In the first place, the consumers find greater differences between the various appeals than do the business men. The total range of values, from best to poorest, for the consumers, was from 4 to 45.5. For the advertising men the total range was only 11.8 to 40.3. This means that the advertising men did not fully realize the differences which were felt by the readers. To the advertising men the 50 appeals tend to be pretty much alike, or rather, these men believed that the consumers would feel the appeals to be pretty much

alike, in persuasiveness. They failed to appreciate the real effects of rather small changes in their copy.

By proper statistical methods a figure can be obtained which will show the degree of correspondence between the arrangements by the various groups of people. When this is done, a coefficient of 100 per cent. means exact correspondence. One of —100 per cent. means just the reverse order in one case of that in the other. A coefficient of 0 per cent. means only a chance or accidental correspondence. Intermediate amounts indicate corresponding degrees of resemblance between the two arrangements. The coefficients for these experiments are as follows:

1. The 20 men and the 20 women agree closely with each other, giving a coefficient of correspondence of 63 per cent.
2. Two different arrangements, by the 20 women, show a very high degree of correspondence (90 per cent.).
3. The average order, as arranged by the advertising men, corresponded only slightly with the average order for the men and women combined. The coefficient is only 36 per cent. of resemblance.

4. When the advertising men arranged the appeals as they thought they would appeal to other men, the degree of correspondence was fairly high, the coefficient being 65 per cent.
5. When the advertising men arranged the appeals as they thought they would appeal to women, the correspondence was much less, the coefficient being only 41 per cent.

That is to say, these experts had very incorrect ideas as to the relative strength of these appeals for men and women in general (36 per cent.). In the case of men alone, their opinions were fairly correct (65 per cent.), while in the case of women the opinion of the experts was much less reliable (41 per cent.).

Taking the table as it stands, the various instincts and interests there represented stand in their order of strength in so far as they may serve as the basis of appeal in business transactions, regardless of the commodity concerned. But it is obvious that not all of these appeals can be used in the case of any single commodity. Thus "Appetizing Qualities" cannot apply to the sale of diamonds or shoes, nor could "Durability" be applied to the merchandising of food

products. The table, nevertheless, affords an approximate statement of the relative strength of available appeals for any given commodity. It is only necessary to begin at the top of the list and select the first appeal which could be applied in the description of the commodity in question. This will then constitute the strongest appeal which can be made in the interest of that commodity. The next in the list which would apply appropriately would be the next strongest, etc. For example, the first appeal which would be appropriate to breakfast foods would be "Healthfulness." Then would come, in order of strength, as indicated by position in the table—"Cleanliness," "Appetizing Qualities," "Reputation of the Firm," "Medicinal Properties," "Economy," "Hospitality," "Substitutes," "Clan Loyalty," "Recommendation by others," and finally "Imported." If the reader will now turn back to the table in the preceding chapter, in which are given the results of a special study of the persuasiveness of advertisements used for breakfast foods, he will find that the order of strength of appeals as indicated by this abstract table coincides with the order determined upon independently by Strong.

SUMMARY

We may then summarize the practical results of this experiment under the following headings:

1. *The table of relative persuasiveness* affords a statement of the order of strengh, in general, of most of the appeals which can be utilized in the process of advertising and selling, regardless of the commodity concerned.

2. Selection from this table of the appeals appropriate to the description of any given commodity enables the formation of a smaller table in which the appropriate appeals stand in their order of relative persuasiveness.

3. Any sex differences, and the amount of these differences, may be determined by the comparison of the orders for men and women as given in the table.

4. The strongest appeals which can be made for any commodity, in the attempt to market it, distribute it, or secure publicity for it, will consist in strictly relevant statements of the characteristics, specific qualities or merits, or "selling points" possessed by the article. This will be especially true if these qualities take the form of cleanliness, healthfulness, scientific construction, economy of time, increase of efficiency, safety,

durability, modernity, appetizing quality, and the power to contribute to the welfare of one's family and dependants.

5. If a commodity possesses none of these qualities it is possible to resort to the use of a second but weaker type of appeal, by trying to associate the article with some specific instinct or effective habit of a more "social," less "personal" character than those of the first group, such appeals as those based on reputation of the firm, guarantee or assertion of the maker, sympathy for others (not in one's family), courtesy, imitation, elegance, hospitality, sport, cheapness, etc. These appeals are not descriptive of the article itself but attempt to utilize, in an incidental way, the strength of instincts and interests which are primarily concerned with situations outside the field of business transactions.

6. The semi-relevant or strictly incidental appeal, appealing to rather indeterminate and general interests, such as those based on civic pride and clan feeling, social superiority impulses, recommendation by others, ideals of fashion and of foreign origin, the promise of physical beauty, and the avoidance of substitutes, are the weakest appeals that could possibly be used. One

is amazed at the extent to which these feeble appeals are relied on in current advertising and selling, and is not surprised at the assertions of experts that two-thirds of the money devoted to securing publicity is wasted.

CHAPTER XV

SEX AND CLASS DIFFERENCES OF INTEREST TO BUSINESS MEN

I. SEX DIFFERENCES

It is not my purpose here to enter upon any discussion of sex or class differences in general, but rather to confine myself to such differences as have been experimentally shown to be present in the processes of purchasing goods, and particularly in the processes of reacting to the appeals of advertisements and of salesmen. Biologists have had much to say concerning elemental differences between the male and female reproductive cells, and have often reasoned, by way of analogy, and with insufficient caution, to similar or corresponding differences between men and women in mature life. The naturalists, in turn, have found characteristic differences in the organization and activities of the sexes among lower animals, and these differences have also been eagerly sought for in human society. The anthropologist has, in his own way, compared the activities and character-

istics of sex as these are reflected in primitive cultures, and many have attempted to trace continuities between these conditions and those of our own complex social organizations, institutions and activities. Finally, the experimental psychologist has investigated in great detail, but seldom with adequate accuracy or scope, the mental characteristics of men and women, as shown by their sensory acuity, their motor capacities, their imagery, memory, attention, associations, reasoning, feelings and emotions, suggestibility, interests, general information, activity, inclination, etc. Readers interested in the outcome of these studies may find them fully discussed in the books enumerated in the appendix.

In the present connection we shall ask but two questions, and shall seek to answer them in so far as this is possible in terms of our present knowledge. These questions are: Are there any characteristic differences between men and women, as we find them to-day, with respect to the ways in which they behave as purchasers of goods, or as readers of advertisements, or as auditors of selling talks? If so, the second question will then be: What are these differences, and can they be in any way specified, demonstrated and measured?

We may begin by inquiring whether or not there are characteristic differences between the things which men buy and those things of which women are purchasers? Clearly this is a question on which the practical business man should be able to speak with authority. But if he has ever formulated an answer to the question, he has either kept the data to himself or published them in inaccessible places. At least I have failed to find any account, in business literature, of what men and women buy. We must rely, then, for our information, on a preliminary study which I have made on a group of 25 New York City families, and must, of course, bear in mind that these results apply only to families of a similar type, living under similar conditions. How far a change in conditions effects a change in the rôle of men and women as purchasers only further investigation can reveal. But the present results are suggestive.

In this investigation members of the family were requested to report, with respect to 80 commonly used articles, whether each article was purchased (a) by the men of the household alone, or (b) solely by the women, or (c) by either or by both in consultation. Some information concerning the character of the homes included may be af-

forded by the facts that 72 per cent. of the families live in apartments, 60 per cent. of them possess neither vehicles of conveyance, pets, nor musical instruments. The annual income ranged

TABLE XVIII

Men and Women as Purchasers

Totals...	80	146	580	279	195

from $2,000 to $5,000, with perhaps a few running higher than this. The commodities may be classified under 12 chief headings, with a number of specifications arranged under each. The following table gives these general headings, with

the number of specifications under each, and the per cent. of the families which reported under the respective columns.

From the examination of the specific articles, the following interesting facts emerge:

1. The only article of clothing bought by men exclusively is their own collars. Only 80 per cent. buy their own shoes and hats. In over 50 per cent. of the cases the men's jewelry, handkerchiefs, socks, and underwear are purchased either by the women alone or in consultation with them. In one-third of the cases the women help buy the men's shirts. Only one-third of the men buy their own handkerchiefs.

2. On the other hand, the men participate but little in the purchase of the women's apparel. Women buy men's things exclusively 11 times as often as the men buy women's things exclusively. Women coöperate with men twice as much as men coöperate with women, in the purchase of their respective apparel.

3. In 100 per cent. of the cases women are sole purchasers of their own underwear, lace, thread, and cooking utensils. In 80 per cent. of the cases they are the sole purchasers of dresses, cloaks, footwear, hats, parasols, gloves, fans, handkerchiefs, clotheslines, chafing dishes, kitchen tables,

ribbons, cloth, flour, vegetables, eggs, butter, bread, cereals, water and canned goods. In over 50 per cent. of the cases they are the sole purchasers of curtains, mattresses, meats, ranges, talcums and perfumes. Women buy 83 per cent. of the food, but less than 50 per cent. of the house furnishings, exclusively.

4. Women buy more of the magazines, men more of the newspapers. Women buy many wedding presents exclusively, but men participate more largely in the purchase of Christmas gifts, birthday gifts, and children's toys. Only 5 per cent. of the pets are bought by women alone, 20 per cent. by men alone.

There are, then, considerable differences between the parts played by men and women as purchasers of goods. If there are now any differences in manner of reacting to the appeals of advertisements and salesmen, these differences will be worth knowing, and such knowledge might be effectively utilized in the direction and formation of appeals, according as they are designed to reach either or both classes. In the course of the preceding chapters there has frequently been occasion to refer to sex differences in one respect or another. These differences, along with others which have been brought out in experiments simi-

lar to those reported here, may now be brought together and confirmed.

1. In so far as we may rely on experiments which tend to show on the part of women a greater sensitivity to sensory impressions, and a more desultory and more permanent memory capacity, it is apparent that the mechanical incentives (intensity, magnitude, contrast, motion, isolation and position) will be less effective and more unnecessary when appealing to women than when appealing to men. Further, that there will be less need for devices calculated to fix impressions in consciousness.

2. Gale finds that women are more attracted by pictures than are men, and his curves of attention values of cuts and reading matter show genuine differences in this respect. Strong also finds that women are more attracted by cuts than are men. In discussing the results of a study of 50 advertisements for a well-known soap he remarks: "Only one among the advertisements preferred by women could be considered as approximating a 'copy-ad,' and there the main interest, apparently small, I should judge, would lie in the three small cuts." (p. 81.)

3. Much the same thing may be said for the use of color. Darwin believed that among the lower

animals the female is strongly affected by color, which the male consequently develops by the process of sexual selection. Thompson found that with the individuals studied by her, visual experience was more important in the consciousness of the women than in that of the men, and that only the women showed prominent associations connected with the different colors. In discussing the matter of color preferences we have already referred to Wissler's finding that the preferred color of an individual tends to shift toward the violet end of the spectrum as he grows older, and to the preference of men for blues and of women for reds. Of course these preferences are very dependent on the uses to which colors are to be put, and a preferred color for a necktie may not be agreeable to the same individual for the interior decoration of a room, or for the background of a billboard.

4. Gale reports that irrelevant material, whether in the reading matter or illustration of an advertisement, attracts the attention and consideration of women more easily than is the case with men. The table in which his data are given shows this to have been the case. Strong remarks, of his experimental results: "The preference for the irrelevant among women confirms

the early work of Gale upon attention value." (p. 80.)

5. With respect to the strength of special appeals, certain clear and interesting differences have been found. Thus in the table in the preceding chapter, giving the relative strength of a large number of appeals, the men may be compared with the women. The results of still other investigations make possible further such comparisons. Chief among the differences found here are the following:

(a) The appeal to civic pride, patriotism or other form of clan feeling is stronger with women than with men. In Table XVII the civic pride appeal ranks about the same for both men and women. But Strong found that advertisements for breakfast foods, based on the slogan "Patronize home industries," were rated "considerably higher by the women than by the men (11.1 as compared with 14.6) and that of the nine who ranked them above eighth place seven were women." (p. 45.)

(b) Appeals to authority of others and to recommendation by others are uniformly found to be rated higher by men than by women, although fairly low for both. Thus in Table XVII the "recommendation" appeals average position 38

in a series of 50, for men, and only 48th place in the series, for women. Similarly Strong finds that "authority advertisements appeal more to men than to women." (p. 41.)

(c) Detailed examination of the relative merit of the various appeals discloses the fact that the *women agree with each other* more closely on *personal* appeals (those based on such conceptions as "style," "nobby," "sanitary," "appetizing," "social standing," "time saved," "safety," "durability," etc.) than do the men. They agree with each other about 25 per cent. more closely than do the men. Furthermore, they agree in placing these appeals *higher* than do the men.

(d) On appeals made to the instincts and impulses underlying social solidarity, such as the recommendation, the reputation of the firm, family affection, guarantee, union made, sympathy, growth of the business, etc., the women disagree more than do the men.

(e) Men disagree most of all on the strength of purely *personal* appeals, such as those indicated by the words: health, social standing, efficiency, time saved, ambition, progress, competition, etc. Women disagree most of all among themselves on the appeals indicated by such

words as popularity, recommendation, reputation, family affection, guarantee, union made, sympathy, growth of the firm, etc.

(f) These facts lead to the further generalization that the men are homogeneous, that is, tend to resemble each other more closely, on their *preferences,* on appeals which are strong. Women, on the contrary, tend to be alike with respect to their *dislikes,* appeals which are weak. Whether this difference bears in the direction of selection and difference in sex experience and training, or merely toward the temporary motives which operate in reacting toward appeals made in the interest of articles of commerce, the experiment does not show. The fact that women have definite and mutual *aversions,* with fewer common *preferences,* while men have fewer determinate *dislikes,* but definite and mutual *preferences,* is an exceedingly interesting discovery, and one which, if verified, may be found to have countless applications in business and in other forms of daily activity. Whether the difference be interpreted to mean a fundamental and inherent sex difference, or merely a difference which reflects our present social organization (which is doubtless an adequate explanation of all the facts) has nothing to do with the present usefulness of the fact itself.

It should be further pointed out that these comparisons do not rest on the results of a single experiment. Thus Strong finds that "when women are given an equal opportunity with men to rate appeals (advertisements) they are able to classify their dislikes as well as their preferences, which men do not. . . . A careful analysis of the data shows that women have more and greater dislikes than men, and are surer of them." (p. 79.) Further evidence is afforded by Kuper's experiments, described in one of the following sections of this chapter.

6. A final difference which is quite commonly held to exist between the ways in which men and women react to appeals has to do with the two forms of appeal which we have characterized as "the long circuit" and "the short circuit." Women are popularly supposed to react more strongly to emotional situations than do men. Since reaction to an emotional situation is what characterizes the "short circuit" process of appeal and response, this would be equivalent to saying that short circuit appeals, such as we have previously described and illustrated, may be directed to women more effectively than to men. Thus Scott says, in a description of the various ways of reaching a decision: "The woman's

method of decision'' has characteristics of its own. ''Insufficient time is given to the deliberation, or difficulty is found in classifying the problem. The deliberation is interrupted by a sudden extreme feeling of value attaching itself to one or the other contemplated alternative. The feelings rush in and take the place of reason. In deciding by the woman's method we are scarcely able to see how we reached our conclusion and we often speak of such decisions as being intuitive. . . . Women are supposed to decide in this way more often than men. They are supposed to have more perfectly developed instincts or intuitions. Their sentiment vanquishes attempts to utilize sophisticated reasoning and the outcome is frequently wise and in every way as worthy of respect as are the results of more complete forms of deliberation.'' (Scott, ''Influencing Men in Business.'')

The same writer then quite properly points out that ''this method is not at all confined to women, but is a very common method of deciding any question in which feelings and emotions are prominent.'' Indeed, the present writer is inclined to go still further and to question the popular notion that women are prone to react more strongly to emotional situations than are men. The real difference, if any exists, is probably due rather to the

kind of reaction which is made, and to the *type of situation* which experientially or conventionally has come to have emotional value. It may, indeed, be said that all of us reach our most important decisions through *feelings of value,* rather than by manipulation of logical premises.

II. AGE AND CLASS DIFFERENCES

On these points there is even less to be said than on the preceding topic. This is not because the differences are smaller, for none of the sex differences found are enormous, nor are they true of all individuals—they are differences between averages, and hold, when present at all, only of men and women in the long run. But the chief reason for the lack of material on age and class differences in reactions to appeals lies in the fact that the topic has seldom been investigated by precise and quantitative methods. An interesting study of the interests of children has been made by Miss Gertrude M. Kuper, who studied the reactions and preferences of 200 children of five nationalities, there being in the group 10 boys and 10 girls for each age from 6.5 to 16.5 years. The following results are quoted from a report of her investigation (*Jour. of Phil.,* July 4, 1912, pp. 376-379).

"The formal experiment consisted in asking an individual child to arrange nine pictures in the order in which he liked them best. The nine pictures were chosen to represent nine specific appeals: landscape, children, animals, religion, pathos, sentiment, patriotism, heroism and action. (They were Cosmos prints and therefore of uniform size and finish.) In all there were three series of these pictures each parallel so far as possible with the other two in their appeals.

"The results were tabulated according to age differences, broad social distinctions, and nationality, but in the last named case the number of subjects was so limited (10 boys and 10 girls to each of the following nationalities: Irish, French, German, and Italian, and only 9 girls and 8 boys to the Spanish) that the results are not held as significant.

"The positive data showed a sex difference in the order of preference for these several appeals. The girls' order was:

Religion
Patriotism
Children
Pathos
Animals

Sentiment
Landscape
The Heroic
Action

"The last two were decidedly lowest in the scale and the first three were quite clearly highest for all ages; but the picture representing these nine curves was one of bewildering intersections as the values changed from year to year.

"The boys' order was:

Religion
Patriotism
Action
The Heroic
Pathos
Animals
Sentiment
Landscape
Children

"The boys' chart representing the curves for these appeals showed greater agreement from year to year. Religion and patriotism, the heroic and action, and landscape and children, kept rather parallel courses all along the age scale, and no very decided tendencies appeared with

progressive age differences. Girls seemed to lose somewhat in interest in children and animals and to take greater interest in the heroic and action pictures. The latter change is explained by the fact that as the girls increased in school knowledge they read an historical background into these more or less warlike scenes.

"Another sex difference noted was *the number of positive dislikes* expressed by each sex. The girls gave 161 dislikes as against the boys' 65. Boys seemed to entertain relative indifference toward the appeals at the bottom of the list.

"In all their comments the girls were far more *personal* than the boys. The personal pronoun and references to their individual experiences were the usual preface to their statements. With the boys it was quite otherwise; they discussed the picture as an objective thing . . ."

These results are particularly interesting as indicating the early age at which appear the differences already discussed in the case of adult men and women.

With respect to class differences, the only experimental data known to me are those secured by Strong, who studied (1) a group of 101 educated business men, students and teachers, (2) a group of 95 educated women, and (3) a

miscellaneous group of 97 men selected at random, and including business men, doctors, blacksmiths, storekeepers, saloonkeepers, policemen, bakers, lawyers, postmasters, etc. His report gives separate results for the groups men students, women students, farmers, business men, doctors, and miscellaneous men.

The only significant class difference revealed is to be found when educated classes are compared with uneducated classes. The difference then disclosed is suggested in the remark: "It may be that this is a characteristic of such a group of uneducated persons—that they are unable to differentiate complex appeals. That is to say, that on the whole any one of these appeals is as strong as any other . . ." Strong further shows that in experiments intended to measure the relative strength of these appeals, whether for psychological or for practical purposes, "A group of 50 college students will represent very closely the judgment of groups of educated men and women, of young business men, such as attend evening school, etc. They will not represent at all the judgment of groups from small towns and farming sections such as regions around Garrison, N. Y., from which the data were obtained." (p. 62.)

By way of conclusion it may be remarked that, although most of the results presented in this treatment of the principles of appeal and response have been demonstrated to be completely valid, many of them must be held to be rather suggestive than proved. They should be suggestive in the first place of the kind of information that may be secured when human nature is submitted to experiment for the purpose of securing more knowledge for the concrete purposes of practical living. They should be further suggestive of at least some of the methods which may be profitably adopted in such experiments. At most, it is not so much the possession of psychological data which will prove of practical service in daily life, but rather the acquisition of the psychological attitude of inquiry, observation and interpretation. In the opinion of the writer the actual *content* of this book will prove of less ultimate service than the *method* which it advocates —that method being in the long run the method which must be adopted by any psychological inquiry which aspires to be fruitful, the method of systematically observing, analysing and formulating *the way in which the mind works,* rather than *what is in the mind* as its work proceeds.

PREFACE

With the advent during recent years of a buyer's market, the study of marketing has come into prominence. Getting the goods to the consumer has now become as important as the actual production of goods, and the costs are oftentimes as great. This fact, together with the rising costs of living, has directed public scrutiny to the subject of marketing, with the aim of simplifying its machinery and lowering prices. Without presuming to prophesy, conditions seem to point to a still greater interest in the subject in the future.

The present volume is designed as a textbook for schools of business administration, and is intended to introduce the student to the marketing process. It does not attempt to describe all phases of the marketing functions; these are more elaborately comprehended in the collateral readings listed in the Appendix. It seeks rather to unify the subject through analysis and the formulation of principles. What the student most needs, probably, is a viewpoint from which he can intelligently organize the growing mass of material to be found in this new division of economic study.

Emphasis is placed on the marketing of manufactured products rather than that of raw materials and agricultural products, because it is in connection with manufactures that a more decided buyer's market has developed and probably will continue to develop. It is here also that the high costs of marketing, with which the public is so consciously concerned, are more frequently to be found. It is likewise true that the curriculum of schools of business administration is often relieved of an intensive study of agricultural products because

of the close relations of such institutions with schools of agriculture. Yet these other products are not overlooked; a brief comparative study of them is made to give the student a broader comprehension of the entire subject.

While the material herein set forth appeals primarily to students as a branch of economic study, experience indicates that it may prove of value to the business man. The evolution of industry and trade is developing a new type of enterpriser who desires to proceed scientifically. This modern "progressive" in business has been kept in mind in the preparation of this volume. In it he will find an analysis of some of his most vexing problems and a frank treatment of changing business conditions.

The author is indebted in various ways to many recent discussions in books and in trade magazines for which acknowledgment is made in the appropriate places. Valuable aid has likewise been extended to him by various business men as well as by his colleagues in the College of Business Administration in the University of Nebraska. A special debt of gratitude is due to: J. W. Fisk, Manager of Hayden's, Omaha; C. F. Kurtz, Vice-President of The Denecke Company, Cedar Rapids, Iowa; A. E. Simmons, Manager of M. L. Parker Company, Davenport, Iowa; H. B. Whitehouse, Sales Agent of National Cash Register Company, Omaha; R. O. Bell, Merchandise Manager of Davidson Brothers Company, Sioux City; and to Dean J. E. LeRossignol and Professor O. R. Martin of the University of Nebraska.

Principles of Marketing

CHAPTER I

DIFFERENTIATION OF MARKETING FUNCTIONS

Pressure of Markets upon Production.—The Industrial Revolution which changed the structure of our economic society is still in progress. Its first phase lasted approximately from 1750 to 1880, and was marked by a widening of markets disproportionate to the increase in production. This was a natural result of machine industry, for although by machine processes goods were produced in quantities formerly unheard of, the development of machinery led to better railroads, the telegraph, and the telephone, which extended the market and made possible the immediate absorption of the mass of newly produced goods. Contemporaneously with this industrial development, new areas were being opened up in the United States, population was increasing at a more rapid rate than during any previously recorded period, while habits and customs of centuries were being discarded as a result of contact with new conditions, and in their place was developing a system of wants more complex and numerous than had ever existed in the history of the world.

The lagging of production behind the markets materially affected the course of our economic development. During this period emphasis was naturally placed on increasing production. Schools of technology were organized, scientific factory management received much attention, motion study of employees became common in manufacturing plants, efficiency engineers were called upon to co-ordinate the different departments of production, and inventions which displaced labor with machinery were numerous. Naturally, little attention

was given to analyzing marketing processes. First of all it was necessary that production become efficient.

Development of Traditional System of Marketing.—Since a seller's market (a market in which the advantage rested with the seller) existed during this period, the manufacturer accepted the distributive system as he found it and turned his goods over to the jobber with little thought of the ultimate consumer. It was a roundabout way of getting goods to the consumer, but the market was seeking the goods; the goods were not seeking the market. Heavy demands to increase production were being made on manufacturers, but they had no time or capital to invest in getting the goods to the market. Neither were they interested as to whether or not their products were marketed economically. A marketing structure, which had developed from the changes that followed the Industrial Revolution, was at their disposal, and it was natural that they should make use of it since no responsibility attached to the manufacturer and he was left free to devote all of his energies to production.

Pressure of Production upon Markets.—The second phase of the Industrial Revolution dates from 1880 and is still in progress. It is characterized by production which increased at a faster rate than the markets developed. The cause of this reversal of conditions can be traced to: (1) a check in the rate of increase in population, (2) the taking up of unoccupied lands, and (3) the fact that the attention which had been given to increasing production now began to bear fruit. The latter reason is perhaps the most important of all, for each year saw quantities of goods placed on the market for which no obvious immediate demand existed. Production now began to seek markets, where previously markets had sought production. The traditional system of distribution did not

permit of such a ready outlet for commodities as the new conditions demanded, so during this period the marketing system underwent many modifications. National advertising, direct selling, the mail order house, chain store, and department store, are all developments resulting from this new condition of economic affairs.

Elimination of the Middleman.—The popular cry for the elimination of the middleman arises from both ends of the distributive process. The consumer has found it increasingly difficult since 1900 to maintain with constantly increasing prices his standard of living, and in seeking an opportunity to vent his wrath has hit upon the distributive system. The producer in many lines has found it difficult to get an adequate outlet for his goods through the old system of distribution, and has undertaken to educate the consumer to demand his goods from the established middlemen, or he has on his own responsibility set out to fulfil the functions of the middleman.

A great deal of loose talk exists about eliminating middlemen, in which there is no attempt to distinguish between the middleman and the middleman's functions. The middleman himself can be eliminated, but his functions cannot. These must be performed by someone. If the manufacturer is handicapped in securing an outlet for his goods, he may take capital and labor (which under other circumstances would be used in producing goods) and utilize these in gaining markets for his goods. Thus, while he may have gone over the heads of the jobber and the retailer, he has used some of his resources to perform some of the functions which they have been accustomed to perform. In other words, the problem of the present-day manufacturer is not whether he should do away with the middleman's functions, but whether he should take over these functions himself. This naturally brings us to a consideration of the functions of the middleman.

Functions of the Middleman.—The functions performed by the middleman may be viewed as the creation of certain kinds of utilities, i.e., want-satisfying characteristics or operations. Utilities may be classified as form, time, place, and ownership:

1. Form utilities are created when, as in a manufacturing operation, the form of commodities is changed. Thus, steel bars are brought into a factory, they are cut into desirable lengths, and then made into razors. Agriculture likewise produces form utilities with the aid of nature.

2. Time utilities are created by storage. Goods are accumulated when the demand for them is weak, and then are carried over until the demand for them is strong. The storage of ice and vegetables illustrates this classification.

3. Place utilities are created by moving or transporting goods from places where they are little needed, to districts in which the demand for them is strong. Hay in some of our western states would be nearly valueless if it could not be removed to districts where it is less plentiful.

4. Ownership utilities are created by the exchange of goods between people. The grocer creates utilities of this nature when he exchanges flour for money; the real estate agent, who brings together buyer and seller of property and effects an exchange, creates ownership utilities.

Of these four kinds of utilities, marketing deals primarily with the last three. Industry may thus be divided into two divisions: (1) manufacturing, or the creation of form utilities, and (2) marketing, or the creation of time, place, and ownership utilities.

In the creation of time, place, and ownership utilities, the middleman performs certain specific duties, such as:

1. Assembling
2. Grading
3. Storing

4. Transporting
5. Risk-taking
6. Financing
7. Selling

The extent to which each of these factors enters into the distribution of any product varies widely, but all of them usually function to some extent in the marketing of goods from the manufacturer to the consumer. Moreover, they all exist because they satisfy some need; they have arisen as a result of natural causes.

Middleman's Former Functions.—Before the Industrial Revolution, each person whose task it was to get goods from the producer to the consumer performed a part of each function. Each successive middleman, so long as he held title to the goods, assumed the risk of their destruction. The same was true of credit losses. Transportation facilities were provided by each middleman for carrying the goods from the producer's storage house to the consumer. The different middlemen extended either cash or credit to themselves or to each other for the purpose of securing title to merchandise during its successive stages of distribution, or for financing the entire distributtive operation. The selling or disposing of goods to succeeding middlemen was likewise a function of each factor in the marketing process, as was also the providing of storage space for the temporary holding of goods which were physically unready for resale, or for which a market had to be found. Finally, the preparation of goods for resale was a necessary part of each middleman's work. Among other operations, this consisted of: classifying, sorting, cleaning, arranging, boxing, crating and reshipping goods.

Rise of Functional Middlemen.—With the widening of the market following the Industrial Revolution, it became more

and more necessary to have some of these functions performed by specialists. Hence we have the rise of what are known as functional middlemen, viz., insurance companies, transportation and express companies, banks and trust companies, and storage companies. These new middlemen differ from the old middlemen in that they assume one function and not portions of a number of functions. With the development of functional middlemen who have taken over some of the duties of the old middlemen, the importance of the latter has declined; only the functions of selling and the preparation of products for reshipment are left to them.

Separation of Producer from Consumer.—This widening of the market, followed by the specialization of the middleman's functions, removed the producer at each stage further from the consumer. The producer was no longer a merchant and therefore had no direct connection with those who consumed his products. Because of this development, his point of view changed. Goods were now desirable from the standpoint of both producer and middleman to the extent that they produced a profit in resale to the retailer. The characteristics of quality and service acquired prominence only when the retailer came into contact with the consumer. Thus the isolation of the producer from the consumer, due to the former becoming separated from the middleman's functions, has resulted in the offering of incongruous suggestions for the purchase of merchandise—all depending on whether or not the goods are intended for resale or consumption.

Disregard for Consumer.—The producer, because of his proximity to the middleman and his removal from the consumer, is inclined to energize over lowering costs of production so that he may be able to offer a lower price to the middleman, rather than to render his products more capable of

giving satisfaction to the consumer. The degree of satisfaction that the goods are capable of affording the consumer, only indirectly benefits the producer, and does not exert the influence on him that salability to the middleman does. Being uncertain or indifferent to the point of view of the consumer, the possibilities of making improvements in quality and service in his goods are overlooked and are subjugated to the more prominent element of profits.

Handicap in Serving Consumer.—In case, however, producers wish to give prominence to customers' desires rather than to the immediate salability of the product to middlemen, the circuitous manner of transmitting ideas of quality and service through the middlemen to the consumer robs them of their potency and neutralizes their value. The middleman handles so many different products that he can ill afford to give undivided attention to a single commodity and accurately and consistently transmit its claims of superiority to retailers. There is thus a break in the chain of ideas regarding the merchandise, and the retailer, in his attempt to create a desire in the customer for the product, transmits to the latter ideas foreign to those brought to him by the middleman who directly preceded him in the distributive process. For this reason the producer is handicapped, by the traditional system of distribution, in conveying to the consumer accurate, forceful, and clearly differentiated ideas regarding his merchandise. With the increasing competition of producers, this handicap under which manufacturers have been working has daily become more apparent.

Modification of Traditional System. — Because larger amounts of goods similar in kind and quality are being produced by competing concerns, it has become increasingly necessary to differentiate products. Manufacturers have come

to realize that a wide distribution for their products can be secured only by transmitting the idea of their merchandise to the customer so directly that he will be favorably impressed with their particular product. In other words, it has become a common belief among producers that customers should be educated away from the universal understanding that shoes are shoes, or that canned peas are canned peas; they should be trained to think of a certain make or brand when the need for shoes or peas arises. This has led to the identification of goods by means of trade-marks and trade-names. It has also led to a more careful study of the needs of customers by producers; more clear-cut statements regarding the functions of merchandise; and a more critical scrutiny of products by customers. All this has meant a nicer adjustment of production to the needs of the consumer, as well as the production of goods made primarily to render satisfaction rather than to sell.

Direct Communication of Producer with Consumer.—In attempting to get into close touch with the consumer and escape from the pressure exerted by the middleman, the producer has taken away from the middleman a part of his selling function, viz., the communication of ideas, and has turned this duty over to functional middlemen—newspapers, periodicals, and other advertising agencies. The removal of this function from the middleman has further weakened his position, which was primarily endangered when he was separated from the functions of transportation, financing, risk-taking, and storage; and with every decrease in duty, the middleman becomes of less consequence in our distributive system.

Residual Function of the Middleman.—The only remaining important function for the middleman is that of assembling, or of rendering the goods physically available to con-

sumers. This function embraces the operations of classifying, sorting, cleaning, arranging, boxing, crating, and reshipping goods. In some lines of merchandise this remaining function is being whittled down by direct shipments from producer to consumer, but in only a few special cases has this movement resulted in the elimination of the middleman and the transfer of his last function to the producer. This has been true because the middleman is primarily fitted and equipped to perform this function economically, and nothing may be gained by the producer in taking over new duties which are foreign to his specialized work. Only where the middleman has stood as a barrier to a more complete distribution, has it been deemed wise by producers to perform this middleman's function themselves. For the most part, whenever they can get this function performed satisfactorily by the middleman, they are content to leave its performance to him.

Elimination of the Wholesaler.—In some lines of merchandise it has been found desirable to take over the residual function of one of the middlemen, viz., the wholesaler. This has been true where the manufacturer has stimulated a demand for his branded products by direct communication to the consumer of ideas about the goods, and where the cost of performing the residual function of the wholesaler was less for the producer than for the middleman. The desirability of taking over this function of the wholesaler by maintaining branch houses, is illustrated by the advantages accruing to a large paint manufacturer:

1. He is able to obtain the entire time of trained men, devoted solely to the handling of his products.

2. He obtains a direct contact with the retailer dealer, who he finds prefers on the whole to buy directly from the manufacturer.

3. He is enabled to carry larger and better assorted stocks than the wholesaler would be willing to carry.

4. In his experience the credit losses are less when the wholesaler is eliminated.

5. He maintains better control of general policy and prices.[1]

In the case of groceries, however, it is nearly impossible to eliminate the wholesaler for the following reasons:

1. There are so many small accounts to handle that it would be necessary to establish expensive business machinery in order to take care of them adequately.

2. The nature of foodstuffs, like corn flakes, makes it necessary for the retailer to have small shipments quite often, hence the producer would have to have a large force of workers whose sole duty it was to take care of the increased labor precipitated by many small orders.

3. Wholesalers have their distribution machinery established in all parts of the country, which would have to be duplicated by a producer attempting to get a wide outlet for his goods.

In the case of ready-to-wear commodities, on the other hand, where style is a prominent or dominating factor, the wholesaler is very profitably eliminated, and the merchandise sent direct from the producer to the retailer. This is true because:

1. The wholesaler cannot afford to run the risk of style change, on the close margin of profit which he charges for his services.

2. The distribution through the wholesaler is less speedy than by direct methods, and in ready-to-wear commodities the loss of time in delivery means the loss of money.

3. Sudden change in styles has gradually induced clothing dealers to go to market several times a year in order to make certain of securing the latest garments. During these trips

[1] A. W. Shaw, Some Problems in Market Distribution, p. 87, Cambridge, Mass., Harvard University Press, 1915.

the retailer establishes a personal contact with the manufacturer, thus making unnecessary an intermediary factor in securing the goods.

4. The increasing cost of clothing has resulted in producing a large element of value in proportion to the bulk.

Elimination of the Retailer.—It has already been stated that in some cases it may be advantageous to keep the wholesaler in the distributive process, and in other cases it may pay to eliminate him. The same is true of another middleman—the retailer. For example, a new product coming on the market may not receive the attention either from the wholesaler or the retailer that it should, and hence it may be necessary for the manufacturer to send out his agents to the consumers in order to create an adequate outlet for his product. This was true of aluminum cooking utensils. Retailers had been selling cheap enameled ware and tin, and failed to realize the value of aluminum ware, which cost many times the amount of the older forms of utensils. The only way in which large distribution for this product could be secured was by personal solicitation carried on by thousands of manufacturers' agents throughout the United States. After the consumer-demand had been created, it was found more economical to distribute these products through retailers and wholesalers. At the beginning, however, distribution would have been retarded if the retailer alone had been relied upon.

It has been desirable to eliminate the retailer, either temporarily or permanently, not only in the distribution of new articles like aluminum ware, typewriters, washing-machines, and the like, but likewise in the marketing of products which are: (1) bulky and expensive, and seldom purchased more than once by a consumer; or (2) very expensive in proportion to their bulk. Illustrations of this latter class of merchandise cover watches, clothing, household appliances, machinery ac-

cessories, and similar items which are sold direct to consumers by mail order houses and manufacturers. The former class is illustrated by farm machinery and automobiles. These goods have to be demonstrated; expert salesmanship must be used to demonstrate their advantages if a satisfactory outlet for the factory producing them is to be developed. As demonstrations and specialized salesmanship cannot be supplied by the retailer, the manufacturer obtains special experts for the purpose, and thus the retailer is eliminated.

Establishment of Business Connections.—It may have appeared from the previous statements that the selling function has been largely taken away from the wholesaler. In fact, only part of his selling function has been taken away, i.e., the communication of ideas regarding the goods to the consumer. The remaining part of this function consists of establishing business connections with manufacturers and retailers. This often demands personal solicitation and continuous correspondence, even though the manufacturer performs the function of conveying ideas regarding the merchandise, and adjusts the numerous everyday complaints and misunderstandings that arise. This aspect of selling cannot be taken over by a functional middleman, and if not performed by the wholesaler must of necessity fall on the shoulders of the producer. For some time at least, and for some commodities, it will be necessary to employ the wholesaler to perform this phase of the selling function, as well as the residual function already referred to.

Closely related to the selling function is also the desirability of intimately adjusting production to the needs of the retail trade. The wholesaler, through his close connection with retailers over a wide area, is often better enabled to study the retail trade than is the manufacturer. The deadening familiarity of direct contact with the ultimate consumer does

not handicap his judgment, as is often the case with the retailer; neither does isolation, such as the producer experiences, prevent him from maintaining sympathetic points of contact with the consumer. In other words, he has a natural point of vantage in analyzing markets because he is neither too near nor too far from them. Some prominent wholesalers are making use of this advantage, and are enabling the producer and retailer to effect a nicer adjustment of goods to desires.

Again, while functional middlemen have taken over the risk-taking, financing, transportation, storage, and selling, yet parts of these functions are daily being performed by wholesalers in distributing many lines of goods. For example, no insurance can be purchased which will prevent the wholesaler from losing money in case the market price of his commodities falls, except in the case of some kinds of grain where organized speculation exists. Again, the wholesaler must provide storage space in order to regulate the daily flow of commodities; only over long periods of time may it be desirable to employ the storage facilities of the functional middleman. Further, retailers are notoriously "slow pay," and wholesalers finance them by allowing them to run bills for a considerable length of time. Manufacturers are often likewise financed by wholesalers who permit them to draw drafts at the time of shipment.

Merchandise Basis of Middlemen Differentiation.—Differentiation among middlemen has not only developed as regards functions, but also as regards commodities handled. There are wholesalers for groceries, hardware, and shoes, as well as for other goods. This type of differentiation is likewise evident in retailing, where the old-time general store is found only at the country crossroads, and where so-called specialty stores have taken the place of stores which formerly handled two or more different lines of goods. It might appear that

the department store is a violation of this tendency toward differentiation, but this is hardly the case, since the department store is in reality nothing more or less than a group of specialty stores under one roof. In other words, it is in no way to be compared with the old general store. The "department idea" makes the store a number of specialized units.

Effect of Number of Middlemen on Costs.—It is a commonly accepted opinion that if some of the middlemen could be eliminated, the costs of marketing goods would be reduced. Such a contention is based on the belief that since every middleman must take out a profit, the larger the number involved in a distributive process, the higher the selling price must be. According to similar reasoning, the larger number of men employed in the production of a shoe, the higher must be its price, since the wages of several men must come out of the sale price of the shoe rather than the wage of one man. Obviously such reasoning is fallacious. A hundred men each performing one operation on the shoe may make a better shoe, and at a lower cost, than one man performing the entire operation. The same applies to the distribution of goods. Several middlemen between the producer and consumer may enable the goods to be marketed at a lower cost per unit than where a less number exists. Specialization in production usually means a larger quantity and a better quality, and this is no less true in the field of distribution. Why anyone should believe that in production a subdivision of processes is desirable but that in distribution it is not, is difficult to understand. In a seller's market the competition among middlemen to get the goods leads to specialization, but in a buyer's market the opposite tendency exists.

Profits of Middlemen.—If the producer assumes the function of communicating ideas to the consumer regarding the

goods, or turns this function over to a specialized agency, the middleman is performing only part of the function which he formerly performed, therefore he should not receive as large a margin of profit as he formerly did. As a compensation for this lower margin of profit on each sale, the middleman is forced to secure a greater turnover; and this is usually possible because of the consumer-demand created by the advertising producer or his agency. If the producer does not reduce the margin of profit to the middleman, it means that the latter is being paid for a duty from which he has been relieved. Eventually the consumer would have to pay for this inefficiency. Some producers no doubt have been reluctant to assume the function of communicating direct with the consumer, because they have felt that the middleman would expect compensation for that function if he were to continue the physical distribution of their goods.

Summary.—While the evolution of industry during the past 150 years has tended toward the differentiation of the middleman's functions, and has apparently, to some extent, lessened the importance of the wholesaler, the residue of functions left to this middleman makes him of great importance in the present distributive system. In the distribution of some lines of goods it has been possible to eliminate this middleman entirely, by transferring all his functions either to the functional middleman, to the producer, or to the consumer. In the distribution of some other lines of merchandise it has been found desirable to eliminate temporarily the wholesaler, but to utilize him ultimately; while in still other classes of products it has been found disadvantageous to attempt to take over the remaining functions of the wholesaler. Whether any or all of the middlemen can be eliminated depends entirely upon the conditions surrounding the distribution of each particular product. But even when the middleman is eliminated,

his functions cannot be; these must be performed either by specialists who divide his duties among themselves, or by the producer or the consumer, or shared in different proportions by each. Only in an autonomous economic order could marketing functions be eliminated; it would then be necessary to adjust production to consumption because of the close relationship in time, place, and ownership existing between the two.

CHAPTER II

INTEGRATION OF MARKETING FUNCTIONS

Transformation from Seller's to Buyer's Market.—In the last generation there has been an extensive readjustment in the distribution system. At times, this change has resulted in disorder and chaos. The normal course of the distributive process as it had been developed up to that time was from manufacturer to jobber, jobber to retailer, and retailer to consumer, each marketing function in the series differentiated and performed by independent organizations. When within recent years manufacturers, jobbers, and retailers attempted to take over one another's functions, disorder naturally resulted. Integration of marketing functions meant the elimination of some old types of middlemen and the combining of their functions under new organizations. The struggle for survival has made the period of transition a bitter one and most confusing in its significance even to the parties involved in it.

This readjustment was caused by the transformation of a seller's market into a buyer's market, and advertising was destined to play an important rôle in the transition. When advertising became known as a marketing force, manufacturers attempt to use it as a device to eliminate the jobber, and in some cases the retailer. It was believed that a consumer-demand could be created which would make possible a permanent, steady outlet for goods and cheaper distribution. The building up of a sales organization, which this plan necessitated, was often a costly expansion, but the belief was prevalent that a cheaper selling expense would ultimately result.

Readjustment from Manufacturer's Viewpoint.—While the change in relationship between demand and supply was the underlying cause of market readjustments, with the resulting disorder to the mechanism, the immediate reasons for integration are found in certain practices of market functionaries. Manufacturers allege that jobbers refuse to push their goods while giving preference to goods of competitors. A manufacturer desires, of course, to increase his production in order to utilize to the fullest extent the utilities of his plant, thereby reducing unit costs. This desirable result cannot be attained, however, if the larger production has no market. If the jobber refuses to create a market, a natural result will be that the manufacturer will try to create his own market by advertising, and by going into the jobbing business.

The manufacturer further accuses the jobbers of getting out their own private brands in competition with the brands of their clients. These substitute brands, he urges, put out by the jobbers who control the channels of trade to the retailer, not only cut down the market for the manufacturer's product, but endanger the reputation which the manufacturer has built up for his goods. Hampered on every side, out of touch with the markets, and dependent for distribution on jobbers who could not be trusted to push their goods, manufacturers have revolted and gone over the heads of both jobber and retailer.

The manufacturer asserts that it has been necessary in most cases to go over the heads of both functionaries, because the retailer has been controlled body and soul by the jobber. The jobber has made a personal friend of the retailer through long years of personal solicitation by his salesmen. In many cases, moreover, he has extended credit to the retailer until the latter lives only by the jobber's sufferance. Because of his hold upon the retailer, indeed, through the influences alike of fear and of gratitude, the jobber has been able to retain

control of the most important outlet for the manufacturer's goods.

From the point of view of the manufacturer, in short, the old conditions of distribution had become unbearable. When relief appeared in the form of advertising he turned to it eagerly as the solution of his marketing problem. His belief was that the jobber could be eliminated from the marketing system, or be forced to carry the goods because of retailer-demand; while retailers would be coerced to handle the advertised goods by reason of consumer-demand. Unfortunately for the manufacturer, such an easy victory was not to be.

Readjustment from Jobber's Viewpoint.—The jobber's explanation of the present market disorder is as follows. The fault lies largely at the door of the manufacturer, who attempted to go over the jobber's head before the jobber put out his own private brands. The jobber has gone into the manufacturing business or has assumed control of sources of supply as a matter of necessity, in retaliation for the manufacturer's going into the jobbing business. When the manufacturer had taken his brand away, the jobber was left with a retailer market but nothing of a specified character to satisfy the demand. In order to keep his organization intact, the jobber has produced or procured his own brands, or has contracted with others to produce the goods on which he has put his label.

The jobber also blames the retailer. He asserts that as the unit of retailing has increased in size there has been a greater tendency for retailers to go direct to manufacturers for goods, securing thereby the same quantity discount as is given to the jobber. This "cream of the business" jobbers claim for their own, and see no justification for the manufacturer's selling over their heads to the large retail stores. The manufacturer,

on the other hand, replies that he is justified in selling to any store which is willing to buy in large quantities similar to those offered to jobbers.

Because of this narrowing of outlet for the jobber's goods, the latter has in many cases gone into the retail business, thereby stiffening competition in retailing and causing cries of protestation from members of the retail trade. The jobber has replied that he must create a market for his goods by going into retailing, because, just as the manufacturer on the one hand has provided a market for himself by creating a consumer-demand, the retailer on the other hand has sought to eliminate the jobber by going over his head to the manufacturer.

Readjustment from Retailer's Viewpoint.—About the same time that jobbers began complaining that they were being crowded out by the retailers, retailers were claiming that they themselves were being crowded out by the jobbers. This was being accomplished, they said, by jobbers' taking the cream of the retail business, i.e., the trade of large establishments, such as boarding houses, hotels, public institutions, societies, clubs, etc. The jobber replied that these buying units desired goods in large quantities such as were being sold to retailers, and that it was no more than right that they should be supplied direct and given a quantity discount.

Failure of Advertising to Eliminate Jobber.—Through all of this confusion the manufacturer was pushing his advertising in the effort to create a market for his goods, but success was uncertain because of the other factors in the marketing system. Consumers were learning to ask for the advertised goods in retail stores, but jobbers were coaching retailers to substitute their brands for the advertised manufacturer's brands. Substitution proved to be surprisingly easy, and the

longed-for and eagerly sought after outlet for the manufacturer's goods proved to be a mirage. Something had to be done to prevent the retailer from making substitutions. Cleverly distinctive trade-marks and convincing copy would not avail; some other means had to be found.

Return of Manufacturer to Old Marketing Channels.—The manufacturer's pride revolted against making overtures to the jobber and retailer, after every effort had been made to eliminate the former and force goods upon the latter, but such overtures to the majority of manufacturers appeared to be the only way out of the new dilemma.[1] The old channels of marketing had to be retained, while devising some new way to induce the jobber and retailer to co-operate with the manufacturer in getting the largest possible distribution. If a sizeable distribution could be secured, one large enough to enable the plant to produce in the stage of decreasing costs, that was all that the manufacturer desired. And if some *rapprochement* with jobber and retailer could accomplish this result—then that was the result to be sought.

A new turn in the readjustment of the factors of marketing is thus seen in the manufacturer's going back to the old channels of distribution. He is not, however, relinquishing his advertising. He still creates his consumer-demand, but he does not expect too much of it. Consumer-demand is no longer looked upon as a force which is capable of overturning established methods of marketing goods; rather, it is viewed as a device which enables a permanent, stable, progressive trade to be established, if it is used in *conjunction* with present marketing facilities. Advertising is now viewed as a means of securing the co-operation of both the jobber and the retailer, rather than as a means of eliminating either of them.

---

[1] Comparatively few manufacturers were able to create their own retail outlets.

Realizing their permanence, the jobber and the retailer are now able to treat with the manufacturer more open-mindedly.

Jobber's Co-operation with Manufacturer.—How has the manufacturer succeeded in securing the co-operation of the jobber in enlarging his distribution? It has been accomplished in the first place by dealing fairly with the jobber and giving him all of the manufacturer's goods. Assured of all of the manufacturer's business, the jobber undertakes to secure it a broad outlet into retail channels. In the second place, assured of a large, staple consumer-demand, the jobber is induced to handle the goods even though the percentage of profit to be secured may be smaller than is derivable from unadvertised brands. In the third place, the jobber is assured of a retailer-demand because of certain methods recently applied in obtaining the retailer's good-will for the product.

Retailer's Co-operation with Manufacturer.—Even after satisfying the demands of the jobber and securing from him wholehearted co-operation in developing wide distribution, the manufacturer had a retailer problem on his hands. The retailer, in many cases, had been opposed to handling nationally advertised merchandise because it carried a smaller percentage of profit than did jobbers' brands. In such cases, even though there was a consumer-demand and the jobber was willing to handle and push the goods of the advertising manufacturer, the retailer was enticed away to longer-profit goods by other jobbers whose interest it was to handle these other lines. This situation demanded an educational campaign for the benefit of the retailer, conducted by the manufacturer, whose interest it was to widen the outlet for his merchandise and make good the vast sums expended in the creation of the consumer-demand.

The effort to get the co-operation of the retailer has taken

many forms. One of the first neecssary steps was to convince the retailer that a larger total profit could be made on advertised brands, even though they did not carry so large a profit per sale as those not advertised. This was often most difficult to prove to the retailer's satisfaction. An advertised article might carry only a gross profit of 25 per cent, while the unadvertised brand perhaps carried a margin of 40 per cent. The manufacturer had to show that the selling of the higher-margin goods lost money to the retailer in the long run. To show this he had to prove that it *cost less to sell* the advertised goods. More of these goods could be sold in a quicker time and by cheaper salespeople, since they were partially sold when the customer came into the store. Likewise, the argument that the store handling well-known goods had the greater prestige was made to do its work. The advantages of a staple demand were not overlooked, while the ability of the jobber to give prompt and efficient service was no doubt another strong argument.

Partial Integration of the Selling Function.—But the manufacturer did not stop here. He not only proved to the retailer that the latter could make more money by handling the advertised line, but he also helped the retailer sell it. In other words, the manufacturer's obligation to the retailer did not cease when the goods were produced and given to the jobber, and when advertising copy had been placed in magazines and newspapers. The manufacturer took upon himself the obligation of moving the goods off the shelves by teaching the retailer methods of salesmanship and advertising within the store. These co-operative selling methods have taken many forms, but the most common of them are found in dealer-literature, window displays and demonstrations.

Dealer-Literature. Dealer-literature has sought to portray the selling points of the goods in the most concise and con-

vincing manner, as well as to indicate the superiority of the merchandise over that of competitors. Human-interest copy, describing processes of manufacture, origin of raw materials, meaning of designs, and history of development, has aroused the enthusiasm of retailer and salespeople. A statement of tests to which goods have been subjected has tended to secure the confidence of the store in the goods, while comprehensive enumeration of ways in which the merchandise can meet the divergent needs of customers has given salespeople interesting and logical material out of which convincing sales talks can be constructed. This effort to make retailers expert in the selling of their goods gives manufacturers an advantage which means more to them than even their consumer-demand.

Window Displays. As regards window displays, some manufacturers provide at cost to the retailer a monthly service of window display. The Victor Talking Machine Company offers a high-grade service which has been worked out by experts. Each window display is tested for its selling power before it is sent out from the factory, and represents a far greater value than it costs the retailer. Each display is designed with attention, not merely to selling power, but likewise to ease of installation. Each one can be quickly set up by unskilled salespeople and is arranged in parts so that they can be made to fit any shaped window.

Demonstrations. Besides these internal methods of rapidly moving the advertised goods off the shelves, demonstrators are sent out from the factory from time to time to prove to the store's customers that what is claimed in their printed matter is true. These demonstrations, while valuable as advertising and as serving to bring new customers into the store, have their greatest value in creating in the retailer and his salespeople renewed enthusiasm for the merchandise. When the salespeople are themselves sold, there is little difficulty in selling the public. The manufacturer is beginning to

realize that he must sell the retailer and his salespeople the idea of the merchandise before he can hope to sell them the merchandise itself. And this is seen to be true even though there is an order of the actual merchandise in the store. More merchandise will not be ordered unless the merchandise in stock moves quickly. The methods indicated above are designed to result in quick turnovers.

Extent of Manufacturer's Co-operation.—It might appear that the manufacturer has more than met the retailer half way in his attempt to increase the distribution of his product. However that may be, he seems willing to go even further. Many of the more progressive manufacturers are not satisfied with educating the retailer to sell more of their own goods, but they are carrying out a plan of retailer education which seeks to enable the retailer to sell more of all goods. Justification for this wider education is derived from the growing belief that the more prosperous the retailer can be made, the better customer he becomes. The more prosperous he is, the sooner he pays his bills, the more trade he draws, the more loyal he becomes.

The nature of such wider retailer education varies under different circumstances, and with the needs of the various merchants, but usually covers better accounting methods, more efficient store arrangement, up-to-date advertising, business-building salesmanship, trade information on how to meet competition, specific questions with reference to price-fixing, figuring turnover, etc. The merchant is indeed indebted to the manufacturer who expends his efforts and money in such service.

Co-operative versus Coercive Methods.—Thus it is seen that manufacturers are getting away from coercion and are adopting co-operative methods of increasing their distribution.

They have come to the realization in many cases that they cannot perform the jobbing function so cheaply as the jobber, and that it is desirable to retain this functionary in their distributive scheme if he can be induced to push their goods. This object has been attained, at least in part, by helping the jobber get a market for their merchandise, and by assuring him 100 per cent of the output.

The manufacturer has also come to realize that he must co-operate with the retailer. Hence he is taking upon himself some of the responsibility of getting the goods off the retailer's shelves. He is proving to the retailer that quick turnover is not a mirage but a reality. Because of this tangible proof the retailer is much more attracted toward advertised goods, even if they bear a less percentage of profit than unadvertised brands. The retailer seems to be the keystone in the marketing arch. A readjustment of stones has been made and some of them have temporarily been left out, but the retailer's position has been recognized as the most strategic. A realization of this fact by retailers ought to go far towards voluntary co-operation on their part with the other functionaries in the marketing system, to the benefit of both themselves and the consumer.

Co-operation or Integration.—It is apparently true that where co-operation is impossible integration is inevitable, and where integration is impossible co-operation is inevitable. In the majority of cases integration of marketing functions has been impossible for several reasons:

1. Manufacturers lack capital to purchase or create their own retail stores.
2. They lack ability, capital, and experience to create their own jobbing department.
3. They cannot secure wide distribution through small selling organizations.

4. In territories where their own selling organizations cannot penetrate, their products are boycotted by retailer and jobber.

Where wide distribution can be secured for a product by eliminating the middleman and taking over his functions, integration is the logical development; where the difficulties involved in the combining of functions are too great, wide distribution can be secured only by intelligent co-operation with the existing marketing mechanism. Such co-operation is going on in grocery, jewelry, and other lines where wide distribution is difficult to secure through a manufacturer's selling organization.

Co-operation a Stepping-Stone to Integration.—It may develop that close co-operation between the market functionaries will ultimately produce a few large integrated systems, rather than numerous small independent organizations. Co-operating with a merchant to the extent of moving his goods off the shelves and improving his general merchandising methods may possibly lead to a more intimate association. Other selling functions of the retailer may be taken over by the manufacturer, resulting at last in complete integration with this manufacturer, or other stores with which this manufacturer has similar connections. Although drug manufacturers had apparently insuperable difficulties to overcome in securing their own retail outlet, these have been overcome by a co-operative combination of stores in which they are financially interested, the stores in turn having acquired an interest in the business of the manufacturers. In this instance, a co-operative beginning has led to integration throughout a wide field. Similar tendencies are seen in other directions.

Potential Supply as an Integrating Force.—It has already been indicated that integration became an important disturb-

ing force when the supply of goods increased at a more rapid rate than the demand. It should be made clear, however, that by supply is meant potential supply, not the actual amount of shoes, clothing, or furniture that is on the market at any one time, but rather the productive capacities of manufacturing plants. At the present time it is possible to produce goods in very large quantities, whereas during the last century productive capacity was much more narrowly limited. If productive capacities are utilized to their fullest extent, costs per unit of product decline; if they are only partially utilized, costs are higher. In order to get into a more advantageous producing stage, an outlet for production must be secured. Only through an increased outlet can production in decreasing costs be made possible. Efforts at co-operation with market functionaries, and schemes to eliminate them, are alike results of the existence of enormous potential supplies.

Chief Advantage of Decreasing Costs.—The decreasing cost stage of production is eagerly sought after by manufacturers not merely because it will return larger immediate profits. There is a more vital motive. Production under decreasing costs produces a cushion of profits which serves as an insurance fund for the profitable continuance of the business during periods of depression and in spite of vigorous competition. For example, if the production cost (including a fair profit) of an article is 20 cents because of production under decreasing costs, while the production cost of a similar article made by a competitor is 24 cents because of less favorable production costs due to inadequate distribution, the selling price of both will be fixed by the producer of the second article at 24 cents. The first manufacturer could by selling the article for 20 cents drive his competitor out of business and take over his trade, thereby increasing his own scale of production and possibly decreasing

costs still further. Under ordinary competition, however, he would probably not elect such a course, but would sell his article for 24 cents, making an extra profit of 4 cents per article. This extra profit in the aggregate will serve as a cushion to ease up the shock of adverse business conditions, while if the market contracts he is able to lower his price to 20 cents and put his competitor out of business. It is this protection which decreasing costs give them that makes manufacturers struggle for wide distribution. The wide distribution will enable them to produce under the most favorable cost conditions. In some lines integration of marketing functions produces the desired result; in other lines co-operation in its varying degrees of completeness makes possible at least a temporary enlargement of distribution. The struggle for business protection is at the root of the struggle for markets.

It often happens that when a manufacturer seeks to find his own markets his distribution costs are higher than when he turned over this function to one of the old specialized agencies. Where the jobber's selling expense may have been 10 per cent, the manufacturer's selling expense may be twice that. With increased production, however, the savings due to decreasing production costs may more than offset the loss incurred by the sales organization. It is with this possibility in view that some manufacturers maintain costly sales organizations when they might have a lower selling expense through some independent organization. As the volume of goods produced and marketed increases, not only may the production be carried on under decreasing costs but also the marketing. This result, insuring a double protection to the entire business, is naturally the aim of manufacturers.

CHAPTER III

THE WHOLESALER

Unjustified Criticism of Wholesaler.—Unfamiliarity on the part of the public with the wholesaler's or jobber's services to the manufacturer and retailer has led to much unjustified condemnation of this middleman. It is doubtless believed by many that prices would be lower if the marketing route could be shortened by eliminating the wholesaler and having the manufacturer sell direct to the retailer. Whether or not such would be the case depends on:

1. Whether the wholesaler is performing useless functions.
2. Whether the wholesaler is performing necessary functions in an inefficient manner.
3. Whether the manufacturer and retailer can perform these functions more advantageously for all concerned.

The nature of the wholesaler's services must, however, first be considered.

Services Rendered Manufacturers

Establishing Connections with Retailers.—It is usually necessary to establish trade connections by means of personal solicitation. For this purpose the wholesaler provides the manufacturer with a trained sales force which covers a vaster area in a more intense manner than the manufacturer could himself. Few manufacturers of a competitive line of groceries could carry a sales force large enough to establish connections

with the 300,000 retailers of food products; many dealers away from the beaten paths of trade, in any particular section of the country, could not be visited by the manufacturer's staff because of the expense involved. For example, a manufacturer of pickles could not afford to send his salesman to a dealer when the expense of calling on the dealer exceeded the profit derived from the probable sale. A wholesaler, however, could afford to call on such a dealer, since pickles is only one of a thousand products which he sells, and the expense of making the call would be spread over many products purchased by the dealer. The expense of selling pickles through the wholesaler would therefore be but a fraction of what it might be were the manufacturer to sell through his own sales force.

Manufacturers who have sought to secure their own dealer-outlet for their products have done so because they believed that their products were not being "pushed" by the wholesaler's salesmen. Their idea of intensive dealer cultivation seemed at variance with the method of selling pursued by the wholesaler. The latter handled so many different products that it seemed impossible for him to push any particular line. In order, therefore, to increase his sales in any one locality, the manufacturer created his own selling organization, with the end in view of extending the area of the selling field as each section became saturated with his product.

Experience has shown, however, that even when sales saturation of territory is desired, there is another alternative for the manufacturer than that just described. This consists of creating consumer-demand by means of advertising, thus magnifying the value of the product in the mind of the retailer, who in turn conveys this emphasis to the wholesaler. In conjunction with this method, a campaign to educate the wholesaler's salesmen regarding the merits of the goods, tends to give the products a prominence in their minds which ulti-

mately means greater emphasis by the salesmen when selling their line to dealers. Thus, from both the consumer and wholesaler end, pressure of ideas can be brought to bear which will tend to produce larger sales per dealer, without the necessity of canceling the wholesaler's services and creating a selling organization for the manufacturer's sole use.

Regulating the Flow of Commodities.—The wholesaler forms a central reservoir into which regular shipments of goods are periodically dumped. Here they are stored until they can be broken up into smaller lots and distributed among retailers. To absorb a known quantity of goods during any period, and to store these goods until needed by dealers, are functions of prime importance, demanding equipment, labor and risk-taking which would add materially to the duties of the manufacturer if he attempted to perform them. Moreover, the fact that these functions are turned over to a specialist means that they are more economically performed, and that they add less cost to the final price the consumer pays for the commodity.

It must be evident that storage is absolutely necessary in connection with the manufacture of commodities, if factories are to run uniformly and without interruption. Without storage facilities, factories would work at top speed during part of the year when the current demand was great, and during other parts of the year when demand was slack would run with a reduced labor force. Such a lack of uniformity in production would add to the cost of the commodities, since speeded and overtime production and slack production indicate inefficient methods of operating a plant. Only when all the facilities of the factory are being utilized to a well-defined limit can the per unit cost of production be held at the lowest point. Above or below this limit loss ensues. It is therefore the function of the wholesaler to draw from the manufacturer

regular amounts of goods that come from a uniformly productive process, and to hold them until they can be passed along to the retailer.

Grading and Classifying Commodities.—The demands and preferences of the trade are not the same in different parts of the country. Because of this fact, commodities must be sorted according to quality, size, style of package, and the like, and must otherwise be prepared for market. This function the wholesaler performs in the light of his extensive knowledge of the trade. It is, therefore, performed by a specialist who levies a less charge against the commodity for these services than would otherwise be the case. Furthermore, the taking over of this function by the middleman amounts to the latter's extending more credit and capital to the manufacturer with which to carry on the specialized work of manufacturing. Because of this larger amount of capital available for manufacturing purposes, the output should be larger, with a corresponding reduction of the cost per unit. Hence the consumer presumably will pay less for the commodity because the wholesaler assumes this function.

Freeing Manufacturer from Retail Credit Problems.—To deal directly with retailers demands a large investment of capital tied up in numerous accounts, the assumption of credit risks, and the clerical expense incident to the establishment and maintenance of the business machinery necessary for the proper accounting of large quantities of goods. If the manufacturer of a grocery specialty with a national distribution should desire to sell direct to retailers, it would be necessary to carry more than a quarter of a million accounts. Many of these accounts would be "slow," thereby absorbing important increments of capital that would otherwise be employed in increasing production. Moreover, some capital

would be completely dissipated, since losses because of bad debts increase with the number of the accounts, and with the changing character of the accounts, i.e., from wholesaler to retailer. These factors would in many cases handicap the manufacturer, and would result in loss if performed at an expense exceeding that at which they could be accomplished by the wholesaler who specializes in such functions.

When dealing with the wholesaler, the manufacturer gets his money in ten days or less. His capital is therefore liquid and can be turned back into the business as rapidly as it is transformed into goods. The manufacturer's accounts are few compared with those necessary when selling to the retailer; possibly they do not exceed a couple of thousand. As it is a much simpler problem to keep up to date the credit standing of this limited number of firms, the credit risks are materially less. Accounting machinery is correspondingly simple and inexpensive. Large and expensive duties are, therefore, taken from the shoulders of the manufacturer when he follows the policy of selling by means of the wholesaler. He could perform these duties himself, the same as he could make the machinery for his factory, but he is a specialist and finds it to his advantage to have all services except that of manufacturing performed by other specialists. Of course, where these external functions are not performed efficiently by the wholesaler, then no alternative except that of taking them over by the manufacturer may exist.

Analyzing Market Conditions.—With the increase of time and space intervening between the production and the consumption of commodities, the problem of determining when and where goods should be sold, and in what quantities, qualities, styles, shapes, and sizes they should be placed on the market, has become one of extreme complexity. Unless the pulse of the market is felt with understanding, possibilities

of overproduction or underproduction are ever present, with an attendant loss to the manufacturer in each case. Here is a situation demanding a specialist, and the wholesaler has thus far qualified to some extent for the position. His advantage over the manufacturer is found in: (1) his organization, and (2) his position in the marketing process.

The wholesaler's organization is one which almost automatically provides him with invaluable market data. He is intimately in touch with actual business conditions throughout the country, or in any particular section, because of his staff of salesmen who are sending in daily and weekly reports from the field.

These salesmen's reports often deal with such topics as changes in the trend of demand, stoppage of demand, increase or decrease in spendable incomes, disturbing factors, calamities, activities of competitors, activities of substitutes, and the like. The wholesaler may therefore be in a position to give valuable market information and advice to his clients. The only difficulty is that where there are many clients, a clash of interests may be almost inevitable.

The wholesaler's position in the marketing process is one of advantage in interpreting the data brought in from the field. Being one step removed from the physical process of production, the wholesaler has a wider perspective; he is better able to judge market data impartially without being prejudiced by the ever-pressing manufacturing problems. In his advantageous position he can see contending conditions in their true relationships. He is likewise far enough away from the consumer not to be distracted by unimportant local movement, and yet close enough to know the trend of the movements taken as a totality. Knowing other than local markets, and also the movements of other wholesalers, the typical wholesaler occupies a position of vantage in gathering and interpreting market information.

Services Rendered Retailers

Establishing Connections with Manufacturers. — The wholesaler brings the retailer in contact with many sources of supply, some of which would otherwise remain unknown. This is accomplished by means of a sales force which may carry the goods of many different manufacturers. By such an organization the offerings of the market are brought to the retailer, making it unnecessary for him to seek out the manufacturer. The retailer is therefore relieved of much responsibility of hunting up goods, and at the same time is educated in respect to the available supply of merchandise of many different origins and varieties. His problem of buying is made easier, hence he can give more of his time and energy to the selling phases of his work.

The retailer is also relieved from the necessity of carrying many accounts with manufacturers all over the country, and is enabled to concentrate his purchases in a few wholesale houses. This service reduces the clerical expense in stores, and simplifies the accounting organization of the small retailer. Much time and expense is saved in making claims and complaints, because these can be registered with one or two wholesalers even though the causes for the complaints or claims may be represented by merchandise in widely differing lines. Moreover, the time required to look over the line of goods presented by the wholesaler's salesman is much less than would be the case if these goods were carried by many different salesmen from different manufacturers. The time already spent by retailers in looking over salesmen's samples is a great drain on their possible activities. Any further encroachment in this direction must justify itself by a corresponding benefit.

Storing Commodities.— The average retailer does not have adequate storage space, equipped with efficient devices for

making goods quickly accessible, and designed to preserve merchandise from deteriorating influences. Disregarding the capital invested in the goods themselves, the retailer does not have the available capital to provide comprehensive facilities for caring for large shipments of merchandise. To provide such facilities would mean the draining of important increments of capital from the purchase of stock. To carry large reserve stocks would mean speculation in respect of their market prices. Under present conditions much of this market risk is borne by the wholesaler who is better supplied with capital and possesses a more comprehensive knowledge with which to meet the situation.

From the wholesaler's storage of merchandise extremely small units must be sent to retail stores from day to day, and often on a few hours' notice. This of necessity is the case, because retailers are required to carry a large variety of goods and with limited capital can handle but a little of each at a time. Where the small retailer has attempted to pursue the opposite course, and has purchased in quantity, he has almost invariably failed. Under normal conditions, the turnover is one of the most important principles of merchandising and no retailer can afford to overlook it. Small, clean, up-to-date, well-selected stocks that are moving, produce profits; while large stocks which become sluggish because of change in demand, deterioration, or lack of interest on the part of salespersons, are liabilities that are a heavy burden on the vitality of any store. The elimination of the wholesaler would mean a radical change in present-day merchandising methods, or else the taking over by the manufacturer of the function of releasing small units of goods to tens of thousands of merchants widely scattered over the country.

Financing the Retailer.—Although the functional middleman—the banker—has assumed a large portion of the func-

tion of financing the distribution of goods, yet the wholesaler has large amounts of capital tied up in financing operations. A large part of these financing operations must continue to be performed by wholesalers, since bankers are generally reluctant to extend credit on the character of the security or the lack of security offered by extensive numbers of retailers. A distinct and exclusive service is therefore rendered many retailers, when wholesalers extend credit to them in the form of a stock of goods, or permit accounts to run for a longer period than is the case when manufacturers sell to wholesalers. Without this intimate financial aid men with small captial would be handicapped in entering business, or be entirely prevented from going into business for themselves. This is especially true of the neighborhood store, which has arisen because it performs a valuable service for outlying customers. The cost-to-sell of these stores may be greater than stores nearer the beaten paths of trade, because of the very fact that wholesalers' discounts are not taken up, but these higher costs are made up by the store's clientele who receive place utilities in connection with their merchandise.

Competition also is stimulated by this financing function of the wholesaler, and consumers receive their goods at a price which in many cases leaves no profit for the retailer. In other words, profits tend toward the vanishing point where strong competition exists. Among the small retailers there is not only strong competition, but excessive competition, thereby insuring the customer his merchandise practically at cost. With a smaller number of retailers, a greater possibility of price understanding would exist, which would aim at maintaining a price that would make possible a profit to all stores that come to an "understanding." It is possible that this excessively strong competition is a bad thing for society, but at any rate the generous extension of credit by wholesalers which makes this condition a possibility must be considered

as an important service to the small retailer, or the man who desires to go into business for himself.

Analyzing Retail Conditions.—An increasingly important function of the wholesaler is that of studying the needs of the retail trade. The wholesaler is coming to realize more clearly every year that his prosperity is inseparably bound up with that of the small retailer. He makes possible the small retailer, and in turn is maintained by him. If one goes, the other also goes. Realizing this intimate connection, the wholesaler is endeavoring to help the retailer purchase those goods which will readily turn, and thus lay a foundation for continuous future sales. This new development is quite in contrast to the former policy often practiced by wholesalers of loading up retailers with more goods than they could sell. When the wholesaler's position in the distributive process is secure, such a policy might be followed for a time with impunity; but with the present movement of manufacturers to get a broader and quicker outlet for their goods, and the corresponding tendency to eliminate the wholesaler wherever possible, the latter has recognized his danger and has strengthened his position by developing a community of interests with the retailer. That the retailer is recognizing the value of this co-operation is evidenced on many sides.

The elements involved in a study of retail needs vary with different commodities. Changes in demand must be sensed, shortages in supply anticipated, degree of saturation in a territory determined, local peculiarities analyzed, and surveys of competitors projected. What the retailer should purchase, how much he should purchase, and when he should purchase it, are as much wholesalers' problems as they are retailers'. Moreover, although the retailer is physically intimate with conditions in his territory, he is more often mentally a stranger to circumstances which vitally affect his business.

The wholesaler, with a broader vision and knowledge of what is going on elsewhere, can more adequately interpret local movements and can induce the retailer to profit by their true significance.

Wholesalers are not only assuming the responsibility of analyzing market conditions which affect the retailer, but they are, in many cases, also endeavoring to increase the internal efficiency of the retail store. This is being accomplished by giving suggestions for displays, fixture arrangement, advertising, and methods of handling customers. Some wholesalers are giving their clients accounting systems, and providing an instructor to install them and get them in running order. Demonstrations are provided, not only to convince the store's customers, but also to arouse the enthusiasm of the retailer and his salespeople for the merchandise. Such instruction in merchandising is one of the most valuable functions performed by the wholesaler, not only from the standpoint of the retailer, but also from that of society. Better merchandising means lower costs, and with the intense competition of the small stores fostered and kept in existence by wholesalers, the customer may expect to get the maximum of service with the minimum of cost.

CHAPTER IV

NEW TYPES OF WHOLESALERS

Manufacturing Wholesalers

Rise of Manufacturing Wholesaler.—If the wholesaler performed only those functions which have thus far been considered, the present system of distribution would present a much less complicated problem. The disturbing element in the situation has been a growing tendency on the part of the wholesalers to manufacture goods themselves, or, what amounts to the same thing, to control the factory output of manufacturers from whom they buy. Many other wholesalers in all lines have concluded that it was to their interests to put up goods under their private brand or label, and thus they have come to be competitors of their clients—the manufacturer whose goods they distribute.

The wholesaler maintains that the manufacturer is to blame for the development of this tangled situation. By selling to department stores, mail order houses, retail chains, and buying syndicates, the manufacturer has taken the cream of the wholesaler's business and left for the latter only the small buying units, the purchases of which bear a smaller percentage of profit in proportion to the expense involved in selling the order. The growth of new types of retailers has presented a temptation to the manufacturer which it has been difficult for him to resist. Larger direct orders were his for the taking, and naturally the wholesaler was not consulted. The wholesaler, being deprived of the profit which was attached to the portion of the manufacturer's output thus sold, was forced

either to content himself with getting a profit from the resale of the balance of the manufacturer's output, or to go into the manufacturing business himself and try to hold the market which he had created for his client's goods. The wholesaler maintains that self-preservation dictated that he follow this latter policy.

The manufacturer has felt forced to adopt the policy of direct dealings with large buying units, because the wholesaler did not create a satisfactory outlet for the manufacturer's goods. Moreover it is asserted that instead of pushing his goods, the wholesaler exerted his influence with the trade to substitute his own private brands for those of the manufacturer. By being closer to the retailer and in more frequent contact with him, such a procedure was possible—it could not be prevented by the manufacturer. With markets sluggish, or closed to his products, the only alternative for the manufacturer was to find his own markets; and fortunately the growth of new types of retailers, such as department stores and mail order houses, made such a direct connection not only possible but profitable. Having developed a selling organization to deal with these larger buying units, it was only natural to expand in order to take care of the smaller units, until at length the manufacturer found himself independent of the wholesaler's services.

Reasons for the Rise of Private Brands.—Either unconsciously, or by deliberately disregarding the consequences, manufacturers have helped to originate and further the marketing of wholesalers' private brands. This has come about in several ways. In the first place, a manufacturer may miscalculate the demand for his trade-marked article, and produce more than can be absorbed in his own market. In some cases it may be possible to carry over this surplus to the following season, while in others a large loss might result

from depreciation or obsolescence. Whichever is the situation, it is usually desirable to sell existing stock in order to liquidate capital for further manufacturing operations. Accordingly, manufacturers sell their surplus in bulk to wholesalers, who attach their own trade-marks or brands to these goods and sell them in competition with those of the manufacturer. The manufacturer feels that he has lost nothing by the transaction because his own brand has been protected, and he has at the same time liquidated sluggish stock.

In the second place, some manufacturers place their trade-mark only on goods of the first class. Imperfect goods are turned over to wholesalers to be branded by them and disposed of to the public, who are unaware of their origin. In lines where this policy has been followed to a high degree, wholesalers' brands naturally have the reputation for inferior quality. Many wholesalers' private brands are, however, of the best quality. In such instances as these the whole purpose of the trade-mark, viz., identification of goods, has been violated, and the customer is at a loss to know who is responsible for them. The manufacturer could market his "seconds" under a different trade-mark, but perhaps this would not be economical, since specialization in distribution is as much desired as in other fields.

In the third place, certain classes of manufacturers have no trade-mark of their own, but produce goods for wholesalers, mail order houses, and dealers, who assume responsibility for the product. Such a policy is often followed because it is the line of least resistance. A wholesaler offers to take the entire output of a manufacturer, to whom he assures not a fancy profit but a certain profit. Rather than to build a reputation for his product through a costly selling or advertising organization, the manufacturer accepts the easy method of sale and turns his yearly output over to the wholesaler. The chief danger of such a policy is that the manu-

facturer may place himself at the mercy of the wholesaler, and in case the latter should refuse to make the usual yearly contract for output, the manufacturer would be without a market. With a large plant on his hands and no market outlet, solvency cannot long be maintained. Many manufacturers, however, are willing to throw their lot in with wholesalers and mail order houses, hence the private brand becomes a deep-rooted institution in the marketing of goods.

Profit on Private Brands.—Non-advertised and wholesalers' private brands usually pay wholesalers a larger percentage of profit than nationally advertised brands. The advertising manufacturer justifies such a policy on the ground that he has performed part of the functions of the wholesaler when he has gone to the expense of making known to customers certain facts respecting the merchandise. With this selling information in the minds of customers, a larger and more spontaneous demand for the goods from retailers results, and this in turn is reflected in a more active demand for the goods which retailers make on wholesalers. The manufacturer, therefore, has taken over to some extent the function of creating demand, and he reimburses himself by allowing the wholesaler a smaller percentage of profit on each nationally advertised article.

There is naturally some opposition on the part of the wholesaler to the smaller percentage of profit allowed by the advertising manufacturer. The latter, in case he does not desire to assume the physical distribution of his own product, in order to be successful must get the co-operation of the wholesaler, which is usually accomplished by demonstrating to this middleman that greater total profits can be secured by selling the nationally advertised product, although the average profit percentage on each article is less than on some competing lines. Total profit is really what the wholesaler

is after, and a quicker turnover of his stock will produce this desired result even where the percentage of profit on individual sales is less than might be secured on non-advertised merchandise.

Protecting Consumer Against Private Brands.—The consumer is not necessarily injured by the distribution of private brands. If, however, the same goods are sold at one price under the manufacturer's trade-mark, and at a lower price under the wholesaler's brand, knowledge of this fact will prejudice the public against both brands. In reality there may be no sound reasons for prejudice, since the manufacturer may be able to maintain quality, reduce his overhead expenses, and improve his product, because of his ability to turn a loss into a gain through disposition of surplus stock to wholesalers.

Because of the belief that the interests of customers are injured by private brands, several attempts have been made to eliminate them by legislation. The most prominent remedy proposed is that the manufacturer be required to put his name on all merchandise produced by him. This, it is believed, would eliminate the private brand for two reasons:

1. Manufacturers would not want it known that they were producing goods for private branding which were identical with those bearing their own trade-mark.
2. Wholesalers would not want it known among retailers that they were not the manufacturers of the goods which they market as their own.

It is probable that neither of these supposed hindrances to the creation of private brands would prove effective. Considering the first proposition, the manufacturer could attach his name inconspicuously as compared to the name of the private brand, so that only those customers who bestowed exceptional scrutiny on the label would discover the actual

producer. The loss of good-will to the manufacturer because of this discovery by a small number of customers, would probably be more than offset by the gain derived from turning surpluses over to wholesalers for private branding. Even with the manufacturer's name conspicuously printed on the label, only comparatively few customers would realize its significance. Yet it must be recognized that in some cases such a legal necessity would undermine customer confidence and lose more than the gain that might come from selling this surplus to the wholesaler.

The second supposed result of such a law would be far less menacing than the first. Many retailers already know that wholesaler's private brands are not made by them. The prestige of the wholesaler is not necessarily at stake if the identity of the product is revealed. A brand should identify the one responsible for it, and not necessarily the maker. The retailer recognizes the wholesaler's responsibility in the matter and, as a rule, would not be prejudiced by antecedent identification. As long as the retailer can identify merchandise and place responsibility, he has no inclination to trace the goods any further. Putting the manufacturer's name on all articles of his production might lessen the prestige of the wholesaler, but it is difficult to see how this operation would prevent the wholesaler from continuing his present method of creating private brands from standard products of national reputation.

Private Brands and Large-Scale Distribution.—Several tendencies exist toward large-scale distribution. The wholesaler is tempted to manufacture his own private brand and substitute it for nationally trade-marked goods when selling to retailers. The manufacturer sooner or later senses the closing of his usual outlets for goods and welcomes the chance which the department store offers of selling direct. This gives the department store an advantage over its smaller competi-

tors and makes for larger department stores, since larger discounts are given with greater bulk purchases from the manufacturer. Unless the small store can develop advantages peculiar to itself, there is a definite and logical direction given to large-scale distribution.

This tendency exists not only from the standpoint of the retailer, but from that of the manufacturer. The latter increases his capitalization so as to include a sales organization, which must often be indefinitely expanded. The small manufacturer, with lack of vision of the market and ignorant of the means of selling direct and most advantageously is gradually eliminated, and the larger organizations which are independent of the wholesaler assume control of production.

This leads to the integration of distribution, since the manufacturer's output becomes so large that he must find outlets for his goods which are in excess of the department and retail chain store demand. He therefore creates a chain of stores himself, and by this last act controls the entire distribution of the goods from the moment they are produced until they are placed in the hands of the consumer. Similar to the integration which has taken place in production, a well-known example of which is the steel industry, is the growing tendency toward integration in the field of distribution.

The fact that manufacturers have permitted wholesalers to create private brands from their surplus or inferior stocks, with the result that they gradually have lost control of the market and have become dependent upon the wholesaler for the sale of their goods, has tended to force the manufacturer to sell direct to large buying units. Whether these large buying units are the result of this tendency or permitted this trend to satisfy itself, is a question difficult to answer. They are both probably cause and effect. The manufacturer would probably have worked out some co-operative measure with the wholesaler if no other outlet had been at his disposal; while,

on the other hand, the department store could not have developed the way it has if it had not possessed the advantage of buying at a quantity discount direct from the manufacturer.

Hindrances to Large-Scale Distribution.—What has here been said about the tendency toward large-scale and integrated distribution must not be construed to imply that this movement will continue at the rate at which it is now going. Public opinion, as reflected in our legislatures and the courts, impeded the progress of a similar movement in the field of production. If it can be shown that it is for the public interest to retard this tendency, there is no doubt that such a result will be achieved.

Another impediment toward the full realization of integration and large-scale distribution, is the combination of inherent advantages peculiar to the small retail store. Because of lower overhead expenses, and with potential efficiency in management and supervision, the smaller retail units may develop latent advantages peculiar to themselves which may go far to offset the advantages of large-scale buying enjoyed by the department store. If such is to be a future development, and there is much to indicate possibilities in that direction, the limit may be reached to the absorption of the retail field by large establishments, and as a consequence the manufacturer must rely more and more upon the wholesaler, since it has already been shown that where small stores exist it is uneconomical for the manufacturer to sell direct.

If the small store has certain inherent advantages over the department store, it may be asked if these same advantages do not inhere in the retail chain; may not the latter therefore displace the independent store thereby making the integrating process complete? In other words, large-scale manufacturing linked up with a large-scale selling force may sell to small stores in a chain owned by these manufacturers. Here would

be a case of large-scale production and large-scale distribution so far as the wholesaler's functions were concerned, but small-scale retailing so far as the physical establishments were concerned.

In answer to this question it may be said that the small independent retailer has certain advantages inherent in his establishment which are not to be found even in the small store of the chain. One preponderating advantage is the interestedness of the management. Another is the loyalty of the community. Whether these would be able to offset the chain store advantages, which involve better accounting systems, more systematic management, and quantity buying, is difficult to decide. It would seem from an investigation of the facts that the small independent store is not doomed if it can be made efficient. Many movements having widely varying sources are now at work to create this efficiency, and it is not too much to suppose that considerable success will result.

It is therefore seen that the problem of eliminating the wholesaler depends upon the changing character of the retailer. If large-scale retail units and the integration of other units are found to be more efficient distributors of goods than the small, independent stores, it may be possible for manufacturers to assume wholesaling functions and eliminate the present units that perform these operations. On the other hand, if the small independent retailer survives, the wholesaler will be necessary in order to supply him economically with goods.

Reasons for Retailer's Assuming Wholesaling Function.—Combining retailing and wholesaling functions under the head of a single organization has been brought about in some cases by the retailer, while in others the wholesaler has initiated the movement. Where the retailer has assumed the whole-

saler's function, the chief reason has been the desire to make a double profit. Another motive has been to develop a higher grade of service to his customers through making more accessible large and varied stocks of merchandise. The prompt delivery of newly produced goods is likewise assured. The retailer is thus enabled to develop a unique business which distinguishes him from competitors who do not enjoy the advantages offered by co-operative wholesale organizations. Even if no profit is made in the wholesaling end of his business, the retailer feels that it has paid for itself if it increases retail sales, establishes good-will, and assures a supply of merchandise that meets the demands of his trade.

Reasons for Wholesaler's Assuming Retail Function.— The wholesaler usually enters the retail business chiefly in order to insure a permanent outlet for his merchandise. With independent retailers forming buying syndicates; with the development of department stores which buy direct from the manufacturer; with the mail order houses satisfying a larger increment of the retail trade, wholesalers have felt the necessity of establishing direct contact with the consumer. This has resulted in chains of stores either owned or controlled by absentee owners or managers, and has presented another problem in marketing which is becoming acute in some communities. It has been found especially necessary for wholesalers to establish their own retail stores when the goods they controlled for resale have had characteristics which rendered them undesirable for the average retailer. Thus, slow-moving goods, broken lots, rare articles with large risk attached, and other goods of a peculiar character have been successfully disposed of only by control of the retail unit by the wholesaler. Another cause which has induced the wholesalers to combine retailing and wholesaling functions is a desire to establish service stations for retailers.

When a wholesaler assumes the retailing function, or vice versa, the wholesale and retail stocks are at first usually not separated, nor is there a separate organization for each. Accounts, however, are separated and someone may be appointed to handle the added line. As the new function grows in importance, segregation of goods and organization becomes complete. However, where wholesale and retail functions have grown up together in the same organization, differentiation has usually existed from the first.

Co-operative Wholesaling

Purpose of Co-operative Wholesaling.—As already indicated, the independent retailer has experienced within recent years keen competition from department stores, chain stores, and mail order houses. He has more recently come to realize that while he has some advantages peculiar to his particular kind of business, in order to survive he must secure buying advantages similar to those secured by these strong competitors. Since large buying power did not exist in each of the small retail units, it gradually became evident that the necessary and longed-for buying power could come only through co-operation of the small stores. Associations of merchants or buying syndicates were therefore formed in order to do for merchants collectively what it was impossible for them to do individually.

The savings effected by large buying power are several; among them is the ability to take up quantity discounts as wholesalers do. Better internal business management, and the elimination of part of the wholesaler's selling expense by maintaining a central warehouse, are also possible. Such profits of the wholesaler as are appropriated the co-operative buying unit distributes to its members as dividends, or lower prices of goods purchased.

Methods of Co-operation.—There are several different ways of carrying on co-operative wholesaling. One is for retailers to organize a buying syndicate, which buys in quantity lots certain lines of staples which they sell to the members for cash. The price represents the cost price plus administration charges. The usual profits of the wholesalers are, by this method, given to the members in the form of a lower price for the merchandise purchased. Usually the members of such a buying organization purchase only a small portion of their total stock in this way, only staples being handled.

A modification of this method has been made by some retail organizations which have established quarters in large manufacturing and distributing centers where manufacturers may display their goods for the benefit of member retailers who visit this exchange periodically. Purchases are made by members through a staff of expert buyers who are maintained by the co-operative organization. A closer touch with the market enables member retailers to purchase a wider range of merchandise than under the form of organization previously described. Even in this case, it is very often difficult for the co-operative organization to satisfy the exact needs of its members. A more exceptional form of co-operative wholesale organization is the incorporation of a body which performs almost the identical functions of the regular wholesale middleman. A warehouse is maintained, salesmen are employed, intimate contact is established with both manufacturers and stockholder retailers, and market information is made available to members. Any savings or profits accompanying the enterprise are paid to stockholders in the form of dividends.

Advantages of Co-operative Wholesaling.—In the first place, selling costs are usually low because the expenses of advertising and salesmen are minimized. The expense of

personal salesmanship is somewhat lessened because members order by mail, or call in person at the co-operative exchange. Mail order buying can be intelligently negotiated if the co-operative concern sends its members catalogues, price quotations, and accurate descriptions of market conditions or notice of special purchases from manufacturers.

Secondly, losses from bad debts are less than is the case with the old-line companies. This is the natural result of a policy of sales on a cash basis, or on very short-term credits—weekly or bi-weekly. The worst impediment to retailer co-operation seems to be overcome when cash payments are assured.

Thirdly, losses because of returned goods are usually smaller than in independent wholesale companies. Goods may be returned only for special reasons—usually when there is some defect in the merchandise. A retailer, being intimately associated with other retailers selling the same line of goods, may, however, be able to dispose of his excess stock through other members of the organization.

Fourthly, shipments direct from the manufacturer to the retailer (drop-shipments) may sometimes be arranged by the co-operative organization. The expense of sorting, classifying, and the like, is thus shifted to the manufacturer, so that the co-operative wholesaler acts merely in the capacity of a sales agent and collector. Such a plan, however, is possible only with those articles where small shipments do not materially increase the expense of the manufacturer. Members are also given the option of transporting their purchases from the wholesaler's warehouse, thus saving the transportation expense, or of having their organization do it for them and paying for it in the invoice.

Disadvantages of Co-operative Wholesaling.—Many obstacles must often be overcome in inaugurating a retail co-

operative buying organization. Antagonism is naturally exhibited by regular wholesalers, and every impediment is thrown in the way of its successful operation. Pressure is sometimes brought to bear on manufacturers to prevent their selling to such organizations, and if goods are difficult to get, membership becomes unstable. Furthermore, an organization of this character may have difficulty in demonstrating its permanence to manufacturers, for many organizations of this character have had but a limited span of life. With credit established, however, manufacturers are usually ready to sell goods to such syndicates, because a ready outlet is formed for their goods, without restrictions of private brands or middleman inertia.

Lack of loyalty to the organization is another stumbling block. When the organization fails to make advantageous connections with manufacturers; when merchandise secured by competitors cannot be secured through the syndicate; when errors in managerial judgment cause losses; and when some members are denied favors, disintegrating influences begin, which, unless counteracted, make for dissolution. The character and intelligence of the membership determines, to a large extent, the success or failure of the venture. Unfortunately, among the smaller retailers breadth of vision is frequently lacking, hence the co-operative movement has not developed as it might. With increasing competition from retail chains, department stores, and manufacturers' selling agencies, a community of interest must sooner or later arise among a growing number of retailers which will exhibit itself in more retail co-operative wholesaling associations.

CHAPTER V

THE DEPARTMENT STORE

Changing Methods of Retailing.—The development of retailing in the United States may be divided into two periods: that preceding the Civil War, and that following it. During the early period there were no department stores, chain stores, or mail order houses; all of these were the outgrowth of conditions following the Civil War. Goods were sold for the most part through general stores, although a few specialty stores had come into being in the cities where a wider market had developed.

Characteristics of Pre-Civil War Period.—Long credits were the rule and discount for cash was uncommon. Goods were purchased in large quantities, usually enough to last half a year. Style changes were infrequent. A wide variety of merchandise could not be purchased because the retailer's capital was tied up in large quantities of a few lines. The "variable price system" prevailed, i.e., the cost price was written in characters on the price tag, and the salesperson endeavored to charge as much over that amount as he thought he could get. This system of pricing goods led to the practice of bargaining, or higgling, the salesperson attempting to get as much as possible for the merchandise and the customer trying to purchase at as low a price as could be negotiated. Production of manufactured products lagged behind the demand for them, which condition tended to increase the number of retailers without increasing their efficiency. Competition was centered around price; service was secondary.

Competition was strong within communities and generated much community unrest. Merchants aimed at a long profit on each sale. Customers were outwitted by retailers and their salespeople wherever possible.

Characteristics of Post-Civil War Period.—In the period following the Civil War, these conditions of retailing underwent a marked change. Rapid fluctuations in prices made buying in smaller quantities necessary, which was made possible by the advent of the traveling-salesman system of distribution. Previously merchants had gone to market twice a year and purchased in bulk; now they could make purchases from six to twelve times during the year. This cutting down of the quantity of purchases led to a reduction in the length of time that bills were allowed to run, while discounts for cash became more and more the custom. Investing less capital in each line led to carrying more lines. Thus a greater variety of merchandise was on exhibition for the benefit of the customer, although only a small stock of each line could be carried at any one time. Increasing the variety made possible a greater number of sales in proportion to the capital invested than formerly, hence it was no longer necessary nor desirable to aim at a large profit on each sale, but rather at a small profit on many sales. In other words, the turnover became one of the most important phases of merchandising, a condition which obtains today.

Rise of the Traveling Salesman. The rise of the traveling-salesman system was contemporaneous with, and partly a cause of, the rapidly changing styles of this period. With the advent of this system, it became possible to purchase frequently in small quantities and thus satisfy the desires of large numbers of people for changing fashions. The distance in point of time between production and consumption was materially shortened, permitting and causing rapid changes

in styles. An element of uncertainty now arose in retailing that previously had not existed. Guesses as to style changes have made some lines, such as ladies' shoes, a precarious undertaking for the retailer. This new hazard has no doubt served to eliminate some of those unfit to adapt themselves to the new situation, and put in their place retailers who were adapted and fitted to forecast the desires of customers. Notwithstanding this fact, much loss of value in retailing is due to obsolescence of stock, which makes sale below cost necessary.

The One-Price System. A comparatively recent development is the substitution of the "one-price system" for the variable price system. Prices are now marked in plain figures, and apply at any one time to all customers. As a consequence of the growth of this policy, bargaining, or higgling over prices, in retail stores has become infrequent, thereby giving retail selling a dignity that previously was lacking. Customers began to have confidence in stores and expressed this new attitude by "shopping," which has become a pleasure for a great many women. Buying in retail stores lost its former combative characteristic, and with the disappearance of this attribute went much of the antagonism which has formerly existed between traders and consumers.

Emphasis on Service. Price gradually became a secondary attraction and service assumed the front rank in importance. This service first took the form of more desirable physical features, such as more attractive show-cases, commodious and well-arranged show-windows, artistic and harmonious lighting systems, and invisible lighting and heating apparatus. Later, service took the form of rapid and frequent delivery systems, the sending of goods on approval, restrooms, libraries, entertainments, and lunchrooms. Very recently, service *par excellence* has come to mean intensive cultivation of the human factor—the salesperson. Personal qualities, such as courtesy, promptness, cheerfulness, honesty, tact, and enthu-

siasm are taught salespeople. Instruction further developed and now embraces a study of the merchandise, human nature, store system and method. By such means, salespersons have in many stores become more efficient distributors of merchandise, and have tended to place retailing on a higher economic and social plane. In some cases they have come to be experts, and in a few instances, competent advisers.

Growth of Co-operation. Owing to the rise of the mail order house and the subsequent introduction of the automobile, competition from the outside loomed up in most of the small cities and towns throughout the United States as a menacing factor. In the effort to stem this invasion, merchants have come to realize that only by presenting a united front, is a chance for success assured. Old-time jealousies between retailers in the same community have thus been healed or forgotten. Efforts which have had as their end a betterment of local retailing conditions have become numerous, and competition between merchants has assumed features of co-operation.

Progressive Methods. One of the most important developments resulting from this new danger of outside competition, is a widespread movement among the retailers and the associations of which they are members to learn more about their business. Old rule-of-thumb or guesswork methods of carrying on retailing have been thrown aside by the more progressive, and others less inclined to follow their example have sooner or later been forced to recognize the merit of new methods, or go out of business. By natural selection, a new type of retailer has thus been developed who is characterized by open-mindedness and a desire to change as conditions change. From such men, demands for new merchandising ideas have been issued broadcast, and in response, young men of great promise have been attracted to the merchandising business; also universities have set aside appropriations for

merchants' institutes at which retailers can assemble and be instructed in the new technique by experts.

Retailing, revolutionized in these many ways, was still to undergo further important changes. The department store, chain store, and mail order house have modified materially our distributive system. Because of their importance and the scope of their development, each will be taken up individually; for it is only in the light of the development of these new types of retailers that present-day marketing can be completely understood.

Origin of the Department Store.—The origin of the department store has been traced to different sources. It is thought by some that it was an outgrowth of the general store which handled all lines of merchandise, but not in departments. According to this view, the general store was departmentalized until it gradually assumed the organization of the present-day department store. The fact is, however, that whenever the demand for a particular commodity would have warranted the formation of a separate department in the general store a one-line or specialty store was usually established which took over a large part of the trade in that commodity. Nor was the department store the result of a movement to combine under one management the numerous specialty stores that grew out of the general store, but of a movement to develop an entirely new organization on the plan of many specialty stores under one roof and controlled by one organization. These new institutions were made possible because of the growing pressure of production on demand. Manufacturers needed a larger and more independent outlet for their goods, and so were eager to foster the growth of the department store by granting quantity discounts and similar concessions. Purchasers, likewise, had long unconsciously desired a convenient place to purchase the many commodities of daily life.

The department store is therefore the result of a natural growth, owing to a multiplicity of forces that were affecting industry after the Civil War. The tendency to shorten the distributive process, the introduction of styles, the tightening of credit, the lower mark-ups, the small stocks, all tended to cause a new form of retail competition which brought into being the department store. More economies were needed, advertising was being introduced to stimulate demand, volume of sales was emphasized, buying strength was of primary importance. These same conditions led to the development of chain stores and mail order houses.

New Ideals of Store Service.—As regards store service, department stores have obligated themselves to perform functions which a few years ago were undreamed of. They have become amusement places for women, and recreation centers for their children. Some innovations are: restrooms, with reading and writing materials; cafés; ticket offices; postal stations; telephone booths; demonstrations; musicales; movies; and the drama. In some cases, department stores have gone into the commercial banking business, and have even acted as brokers for corporation securities. Playgrounds and hospitals take care of those unable to avail themselves of these advantages elsewhere. Except in isolated instances there is no direct charge for these services, and as a consequence the financial burden of carrying on the business is increased greatly. If, however, such attractions secure "volume," they are regarded by store managers as having performed a desirable function in modern merchandising, and are justifiable. The public demands such service and apparently is willing to defray the expense by paying increased prices.

The Buying Advantage.—Perhaps the most important advantage that the department store has had over its com-

petitors lies in its buying power, an advantage which was of more than usual importance in the years following the Civil War. In the first place, during this period rapid industrial expansion widened the market and made any forecast as to the nature and extent of the demand increasingly difficult for manufacturers, especially as the number of new competitors in each industry largely increased. This fact was conducive to miscalculations in quality and quantity of goods produced, and the only large outlet for surpluses of merchandise, produced as a result of mistaken forecasts, was through the department store. Hence the buying organizations of these institutions, with ready cash at their disposal, took advantage of the manufacturer's sacrifices and made bargain sales a prominent feature of department store business. By means of this advantage, department stores have created the keenest competition for small retailers to meet, and have, in many instances, forced the latter to form co-operative buying associations.

In the second place, the large increase in the production of merchandise during the last generation, due to scientific management and better technique, had led manufacturers to strain every nerve to find adequate and permanent outlets for their increasing production. As stated in Chapter IV, wholesalers were not ready or willing to push individual lines; the more aggressive manufacturers accordingly were willing and anxious to sell direct to any retailer who had good credit and who could buy in quantities formerly disposed of to wholesalers. As a direct result of this pressure, the department store came into being and offered a ready outlet for large quantities of merchandise. The manufacturer gave the department store a discount on quantity purchases almost equivalent to the per cent of profit formerly taken by the wholesalers. With a saving that varied from 5 to 15 per cent on standard merchandise, the department store could offer

bargains even when it was not able to pick up job lots or surpluses from manufacturers who had overproduced.

The department store has therefore enjoyed a steady supply of low-priced merchandise, and by bargain sales of these goods has purchased the allegiance of the average consumer. Whether or not the department store would have come into being if rapidly increasing production had not led to the demoralization of the old channels of marketing, is a question difficult to answer. Possibly some of the other advantages of the department store yet to be mentioned would have been sufficient to bring into existence this new form of retailing. However that may be, the department store has flourished as a direct result of the new circumstances pertaining to production, and has had an advantage over the small store which the latter has found it difficult to overcome.

Specialization of Functions.—The next important phase of department store efficiency is the high degree of specialization which has been effected throughout its organization. Whereas in the general store a salesperson sold goods in many departments, in the department store a salesperson sells goods in but one department. This narrowing of the selling area gives each salesperson the opportunity to become a specialist in a single line. While salespeople in department stores have not as a rule become experts, it is no doubt true that the basis exists for such a development, and that department store managers are looking forward to the time when salespeople will be trained to make full use of this opportunity. The public will then receive a character of service which it is impossible for the general store to give, because of its lack of division of labor.

Besides the specialization in selling, there is specialization in buying. Each department has its own buyer who is permitted to become a specialist, and eventually to develop into

an expert. Market conditions have become so complicated, and sources of supply so numerous, that buyers in order to be efficient must spend all of their time in one line of work. They cannot be efficient buyers for many lines—a duty which falls on general store managers. A further advantage of having an expert buyer in each department lies in the possibility of having him instruct salespeople regarding merchandise. No one is better fitted for this important task than the buyer, and the degree of expertness of the salespeople in his department will depend largely upon the buyer's knowledge and his willingness to impart it. This expert knowledge regarding merchandise is the most recent and important service which department stores are preparing to offer the public.

The department store organization is split up into many specialized organizations. It is, in a way, a combination of specialty stores. Accounts for each department are kept separately; departments must pay for themselves; general expense, such as light, heat, and rent are prorated among departments; and the buying and selling organization for each department is a distinct unit. In the department store—to contrast it with the general store—the accounting, advertising, handling of cash, and the like, are given over to a specialized department which serves all departments. This is a good illustration of the extent to which specialization in the department store has developed, and because of this elaborate subdivision of work, the department store can in no wise be compared with the old general merchandise store. Both are supposed to sell everything, but here the resemblance ceases. Specialization has transformed the department store into a fundamentally different buying and selling organization.

Economies Resulting from Combination.—A large saving no doubt results from having many departments served by

one accounting department, one delivery department, one credit department, one advertising department, one welfare department, and so forth. In other words, doubling the number of departments would not double the advertising, accounting, or other expense. On the other hand, increasing the number of specialty stores would no doubt make necessary duplications of these overhead expenses. Because of the possibility of distributing overhead expenses over more merchandise and more departments, department stores are enabled to charge a smaller amount to each department. One department helps another. Customers are attracted by advertising to purchase goods in one department, but before they leave the store they are attracted to another department where unintended purchases are made. In such a case, the advertising charge is spread over two sales instead of one.

The department store has an advantage over the specialty store in credit and collections. It is in a better position to extend credit on a sound basis because of its opportunities of ascertaining the nature of the risk. In cases where credit should not have been extended, the loss is usually less because of the strength of the collection department. More credit can be extended because the large store has more prestige than the small one, and customers assume that a collection power exists which in fact may not. The small specialty store must more often refuse credit or suffer a larger loss from bad debts. This advantage of the department store in regard to credits and collections is nothing more or less than the power to purchase customer buying-power. It amounts to an extension of business, which in turn tends to reduce the percentage of overhead levied against each department.

Department Store Rents.—In specialty shops that sell ladies' ready-to-wear apparel, the rent expense, provided the shop is on the ground floor, is greater than that charged

against a similar department on the second floor of a department store. Yet the sales in the latter may be as large or larger than in the former, depending upon the accessibility of that department and the extent of co-operation it enjoys from other departments. Other goods such as hardware, millinery, household goods, and children's clothing are usually sold on the ground floor in specialty stores, but are invariably to be found on the second, third, or fourth floor in department stores. A ground floor rental is at least twice that of a second floor, and sometimes more; the third floor is from a third to a sixth cheaper. Some department stores train their employees to suggest the purchase of goods sold on other floors, and if such extra sales can be made a distinct advantage accrues to the department store. By means of attractive ground-floor displays, persuasive advertising, co-operation among departments, accessible elevators, and obliging floor managers, a large proportion of customers entering a store may be induced to go to other floors; and it must not be overlooked that the lower prices due to lower rents may be the decisive inducement to the possible purchaser.

There is of course another side to all this matter. To assume, as is popularly done, that the department store can distribute merchandise at a lower cost than specialty or general stores is to go beyond the evidence. In fact, the cost-to-sell of department stores is usually from 2 to 10 per cent higher than for other types of stores. As regards rent, especially, even though some saving is made because of the utilization of inexpensive upper floors, it has been found that retail rents increase with the size of the city, and department stores are found only in the larger cities. In department stores, moreover, the ratio of rent to gross sales is higher than in specialty stores in the same city, probably because of the large amount of unproductive space that is given out to service features. Of course these service features bring customers to the store, but

they evidently do not produce a volume of sales sufficient to lower the percentage of rents to goods sold, to the general average for specialty shops.

Advertising Expense.—Advertising expense for department stores is usually more than that of specialty stores. It ranges from 2 to 5 per cent of sales while for the specialty stores it ranges from a fraction of 1 per cent to 3 per cent. The department store must spend a larger per cent of its sales on advertising because: it must draw trade from a larger territory; its competitors are more widely scattered and have the advantage of a knowledge of the whims of the very consumers the department store is attempting to attract; it must have a satisfactory volume of trade, and this volume can be realized only when a partial sale of its goods is made before the customer enters the store. Its size increases the interest of its news for customers, while the fact that it picks up job lots and special purchases necessitates the using of much descriptive advertising. In conformity with store service policy, this advertising must be attractively presented. The specialty store on the other hand may often be satisfied with the "name before the public" type of advertisement.

Delivery Costs.—The delivery for all departments is performed by one department, and it might be thought that as a consequence a large saving would result. In a sense this is true. In proportion to sales, however, the delivery cost for a department store is greater than is the case for other types. As might be supposed, this is due to the larger territory covered by the department store delivery service, and also to more numerous deliveries in the same territory. Customers have come to expect department stores to deliver inconsequential articles and to perform the service promptly. For advertising purposes the most up-to-date equipment is maintained,

hence depreciation and obsolescence charges are higher than is the case with other stores.

Ratio of Salaries to Sales.—The ratio of salaries to sales is generally about the same for the department as it is for the specialty store. Although the majority of salespeople are paid less than in specialty stores, the managers receive more. This alone, perhaps, would not be sufficient to explain the high level of wages in department stores. A further cause can be found in the waste arising through miscalculation in allotting salespeople to different tasks, and also in the lack of supervision which enables inefficiency to creep in and decrease sales. Owing to the high degree of specialization, a large amount of unproductive labor must be employed to do work, part of which at least might be done by salespeople at certain periods of the day if division of labor was not carried to such an extreme. For every person selling goods in a department store, one person is working behind the scenes. In the small specialty store, some of the scenery is shifted, so to speak, by the actors before they appear on the selling stage. In the department store, a separate force must be employed to perform work other than selling.

Gratuitous Service Costs.—Gratuitous service is the cause of much of the abnormal expense of the department store. Restrooms levy rent, capital, and labor expense against the overhead. The same is true with respect to concerts, style shows, playrooms, telephone service, checking service, railroad ticket service, taxi service, and the like. With competitors enlarging the scope of service and intent upon working out further ingenious ways of catering to the public, there seems no way to reduce expense in this direction. Service features attract customers to the store, and store managers seem to content themselves with knowledge of this fact. They feel

that service must continue to expand in the directions dictated by competition and public demand, and that any reduction in cost-to-sell must come from other directions.

Inefficiencies of Department Stores.—Generally speaking, the further away the financially interested proprietor is from the actual work that is being done, the greater the inefficiency of the work. Supervision by salaried floor managers is often of a high character, but it is not imbued with that vital interest which exists in the heart of the proprietor. There is much truth in the old saying, "The hireling fleeth because he is a hireling." Soilage, leakage, spoilage, breakage, and other loss of materials and merchandise are more likely to occur where there is no direct incentive to keep them down, and where hired diligence is substituted for the diligence of ownership. Some department stores are partially eliminating this waste by giving floor managers and department heads a financial interest in the business. This is no doubt a step in the right direction. In other cases employees are given a share of savings resulting from the employment of new methods which do not cut down the volume of sales. It is difficult to forecast the extent to which such methods of providing incentives to save will cut down the leaks. It may possibly be found that present-day waste is not a necessary evil of department store organization.

Many sales are lost because of low-grade salesmanship. As already indicated, the general run of department store salespeople get lower wages than those in specialty stores. The wages paid seem to reflect in most cases the value of the labor service purchased by the department store. The low-priced salesperson is usually a machine, an automaton who says, "Something?" and takes the money. The customer is given no individual service, and is often antagonized by some unintentionally senseless remark of the salesperson. The

specialty store prides itself on its ability to handle customers intelligently, and its efforts do not present the appearance of machine-like activity. Customers are addressed by name and their likes and dislikes remembered and catered to. They receive a genuine personal attention which may help to offset many of the gratuitously lavish services provided by the department store.

It is probable that this defect in department store organization is not fundamental and can be at least partially corrected. It has existed protractedly because department store managers have thought that the goods could be largely sold by advertising before the customer came into the store. Hence it was felt that a lower grade of salesperson could display the goods than would otherwise be the case. Lavish window displays, ingenious sales plans, gratuitous service, unusually prompt deliveries, and the geographic location of the store were also supposed to attract the customer, and to offset these expenses a saving had to be made in the sales force. Gradually it is becoming more evident to department store managers that all of these remarkable and costly incentives to the customer are wasted if the girl behind the counter antagonizes or exasperates the customer. If the wrong article is sold, or claims are made which cannot be substantiated, the store has a dissatisfied customer; and all of the extravagant advertising, show windows, and restrooms will avail nothing.

Educational Campaigns.—It is being realized, therefore, that high-grade salespeople are necessary to a department store as well as customer-satisfying forms of physical service. In line with this realization, department stores are making extensive plans to educate their sales force to serve customers adequately. This is no doubt a cheaper and better method of getting a desirable sales force than that of buying an efficient one ready-made. In the first place, the latter can

only rarely be found, and in the second place, the store can give the salespeople the training especially fitted to meet its peculiar demands. No doubt much money must be spent in this direction if the department store is to keep the lead that it has secured. This does not necessarily mean a higher overhead expense in any department or in the store as a whole. The probability is that the increased sales, resulting from greater personal efficiency, will more than absorb the expense of training salespeople.

It may be contended that as personal efficiency increases, salaries must increase, and thus the overhead must eventually feel the effects of such a policy. The answer to this is found in the attitude which customers hold toward salespeople who are looked upon as experts. Fewer questions are asked of such salespersons, less time is consumed in the sale, more sales are made in a given period of time; hence the cost per sale does not rise, and may more probably decrease. In other words, neither the customer nor the proprietor pays for the increase in salaries due to greater efficiency; the increase is paid out of the profit made on the excess of goods sold by the efficient salesman over the amount sold by the inefficient.

CHAPTER VI

THE CHAIN STORE

Origin and Development.—The chain store grew out of the disorganized economic conditions following the Civil War. Manufacturers were becoming dissatisfied because their increased production was not receiving a ready outlet through wholesalers. The middleman began to view advertising as a dangerous substitute for direct solicitation and accordingly took over some of the functions of the manufacturer by creating private brands. Chain stores grew up in response to the demand for them as evidenced by the manufacturer's willingness to give quantity discounts to any organization of retailers able to buy in bulk. In some cases, where chain store organizations did not grow in response to the need for them, they were created by the manufacturer; hence the latter became both wholesaler and retailer. In other cases, where the manufacturer succeeded in prevailing upon the old-line dealer to purchase direct, the wholesaler organized chain stores to form an outlet for his own brands. Or, as was sometimes the case, the manufacturer's chain store put the old-line dealers out of business, or diminished their importance, thereby dominating the market and forcing the wholesaler to form a chain of his own.

Moreover, this growing tendency of the manufacturer to give quantity discounts to retailers, and at the same time to create consumer-demand by means of advertising, has developed chain stores, other than manufacturers' and wholesalers' chains. In the first place, some retailers owning only one store have seen the economies resulting from quantity

purchases, and have added from time to time another store to their control. Usually this has been accomplished by the purchase of the business of a retiring retailer, or that of a "dead" storekeeper. These branch stores have sometimes been made independent units, while in other instances they have been operated in conjunction with the orginal store.

Some of the largest retail chains in the United States have been started by corporations especially designed to acquire, create, or combine retail stores. In other cases, the initiative in forming chains has come from the retailers themselves who have formed joint-stock companies, each retailer taking out a certain amount of stock in the new company and in return transferring his store to the new organization. In all cases the object has been to secure greater profits as a result of increased buying power, as well as to secure the advantages that come from combination of control.

Buying Advantages.—The wholesaler considers the chain store an especially valuable customer because of its ability to buy in large quantities, because of its financial strength, and because of the stabilizing effect it has on his outlet. In recognition of these desirable attributes the chain store is given by the wholesaler important concessions, one of the most common of which is "future dating"—dating the bill several weeks later than the date on which the delivery of the goods is made. This unusual extension of credit gives the chain store a material advantage over the independent store, which can get the discount only by making payment in ten, fifteen, or thirty days. By a quick turnover, such chain stores are very often able to sell the goods to the customer before they are required to pay their bills. Borrowing money at the bank in such cases is made unnecessary, and a saving in interest charges results. In many cases the smaller retailer's credit is such that he cannot borrow readily at the bank and there-

fore cannot take up his discounts. Under such circumstances, the small dealer is at a still greater disadvantage as compared with his chain store competitor.

Being the wholesaler's most valued customer, the chain store is given the benefit of secret discounts, inside prices, or confidential market information. Further, the chain store can employ a staff of buyers, who, by virtue of the preferential position of the company they represent, can locate bargains and new goods, and can make connections with sources of supply which are closed to the many dealers who are unable to seek them out and who could not profit by the information if they had it. Wider and more intimate market information is a prime advantage of the chain store organization.

When the chain store is not satisfied with such advantages as are to be had from purchasing through wholesalers, it goes over the heads of these middlemen and buys direct from the manufacturers. By so doing it is possible to absorb the wholesalers' profits, and to set a smaller retail price for merchandise and yet make a greater total net profit than the small independent store. Because of the possibilities of wide and more unobstructed distribution, if the chain is a large one with stores well distributed over the country, it may be a more desirable customer than the wholesaler, and because of this greater ability to market manufacturers' products, it may receive even lower prices than those quoted to wholesalers. As chain stores grow in size, they eventually reach this preferential position, and because of the buying advantage resulting therefrom they have come to be recognized as the most serious competitors of the independent store.

Selling Advantages.—In communities where competition is strong, the chain can lower prices in order to dispose of a competitor, and recoup itself for the loss incurred by raising prices in other communities where pressure from competitors

is not so evident. After competitors have been disposed of and the field is left to the chain, high prices can be introduced again without fear of loss of sales. Especially is such a policy workable where the community is isolated or not within easy reach of a large city. This ability to continue cutting prices indefinitely, gives the chain store a weapon which is perhaps the most dangerous in its possession. That many chains have not seen fit to exercise it, is no assurance that they may not.

The chain store is better able to cut prices than the independent dealer for the reason that the former has access to, or is the manufacturer of, private brands upon which it can fall back. On the other hand, should the chain purchase the nationally advertised goods traded in by the small retailer and sell them below their advertised price, the independent dealer would be unable to find other goods to fill their place and would be forced to discontinue business or to sell at higher prices. When such a policy is followed, the public gets the idea that the chain can sell more cheaply than its smaller competitors; or it assumes that the smaller retailers are attempting to secure too long a profit. In either case, the chain secures the good-will lost by the independent store, and increases its sales on other lines. The chain store has another interest in price-cutting. With the small retailer's goods discredited because of their sale in the chain store at a cut price, the chain can exploit its private brands. Many manufacturers have tried to prevent chains from cutting prices on their nationally advertised goods, but with so many contacts with the market afforded the chain, the manufacturer has found it difficult to enforce his ideas on the retail chain. The latter can get the goods, and with price maintenance declared illegal, the price-cutting will continue.

Advantages of Specialization.—The work of the chain store has been divided and subdivided until the most important

functions are performed by specialists who ultimately develop into experts in their particular line. In the case of the United Cigar Stores Company, real estate is handled by a subsidiary company. This work consists of the purchasing and renting of sites, the maintenance and betterment of property, as well as its subletting. Another company plans and executes window displays for all of the stores. Two other companies have charge of the agency and the premium phase of the business.

The small dealer, on the other hand, is usually inexperienced in his dealings with landlords and cannot drive such bargains as can the sophisticated chain organization. He selects mediocre locations, whereas, if he could have afforded an expert analysis of relative sites, he might have made other choices. The chain stores have made it a policy to investigate trade tendencies in the towns in which they plan to settle. They know the per capita consumption of their products and the number of people who pass any particular site the purchase of which is being contemplated. By such scientific analyses, guesswork has been largely eliminated and profits are assured wherever a location is determined upon.

The management of chains is usually of a higher character than that of the small independent store. This in many cases is necessarily so because the small store proprietor does not have sufficient trade to warrant division of labor. He is a jack-of-all-work in the store, selling goods on the floor, buying, writing advertising, keeping books, doing janitor work, and so forth. It is obvious that under such circumstances expertness in any particular line is impossible. The larger aspects of management become, for him, subordinated to everyday detail; his mind loses its freedom and ability to deal with large problems of changing trade conditions. From such conditions as these only mediocre service develops. Then, perhaps, an opening presents itself for a new kind of retailing

unit which is able to preserve the advantages of the small store and yet combine with them the efficiencies and advantages which come with large-scale operations.

Scientific Business Control.—The chain is controlled and direction is given to its energies by means of comprehensive and accurate accounting systems, which bring to light unprofitable commodities, leaks, and wastes, and determine accurate costs. The sales during different periods in any store and in all of the stores are readily accessible for comparative purposes, so that an incentive is given to each store to beat not only its own record but that of the other stores in the chain. By this method one of the greatest sources of inefficiency and decay in combinations is eliminated, viz., the weakening of competition. Each store is controlled by its own accounts, which are sent to the central office; and competition between the different stores is constantly active, because each store has access to the business statistics of every other store.

The business thus takes on the aspects of a game. Those who win their quotas are given bonuses or premiums. Encouragement to managers and employees is given out from time to time by means of house organs which give the status of each unit in the system. The highest efficiency is stimulated in order to increase the sales each year, and the handicap of having a hired absentee manager is thereby partially overcome. With a prize for the winners of the game, and accurate standards of achievement developed by accounting systems, a stimulus and control over each store is secured which means a minimum of loss with a maximum of sales.

Low Cost-to-Sell.—As compared with the independent store, the chain for several reasons has a low selling expense. In the first place, these stores can interchange any merchandise which is not moving. If one store has become stocked, for

example, with a line of shoes which is not popular in that particular locality, it can be exchanged for other goods or credit with some other store in which an outlet for the shoes may exist. Especially is this true where chains cover a large territory. It has often been found that what is not selling in Iowa will sell readily in Wyoming, and vice versa. Such an interchange of merchandise prevents mark-down sales, which are a loss to the independent merchant who, if bad judgment has been used in purchasing, has no other recourse than sales.

In the second place, many chain stores make no deliveries. Such a policy saves from 2 to 5 per cent on sales. When deliveries are made, there are usually requirements as to the size of the purchase, or an extra charge is imposed. As already indicated, the department store has multiplied indefinitely its delivery service, with a corresponding increase of the cost-to-sell. Independent small stores have tended to follow the lead of the department store. The chains, however, seem to have taken a definite stand against increasing expense through expanding this service, and during a period of rising prices, this obvious attempt on the part of chain stores to economize has attracted a great many customers whose incomes have not been keeping pace with the upward trend of prices. On the other hand, no doubt sales have been lost because certain customers do not want to take their purchases with them and are willing to pay the store for this service.

In the third place, standardization and the handling of the accounting and advertising functions by experts produce the maximum utility with the minimum cost. The same is true in granting credit and making collections. More care is exercised in extending credit, hence losses from this source are less than in the independent store, which is often eager to get more customers regardless of their ability or willing-

ness to pay. The chain store relies on its lower prices to attract customers, and refuses to extend credit except to purchasers having thoroughly established ratings. Likewise, in collections, the chain has a great advantage over the local independent store. The proprietor of the latter is well-known in the community and dislikes bringing too strong pressure to bear on delinquents. Such a leniency causes loss, particularly as losses generally increase in direct proportion to the time bills are allowed to run. The chain, on the other hand, is run by the manager from headquarters, and pressure of a determined or legal character is more imminent because no sentimental ties exist; consequently, customers will almost always pay chain store accounts before those of independents. A large number of chains sell for cash, thus eliminating all possibilities of loss through bad debts, which average, perhaps, ¼ to ½ per cent in independent stores.

The cost-to-sell is affected materially by the rapid turnovers which are characteristic of chains. It has been stated[1] that drug chains turn their stock from 10 to 12 times, as against 3 or 4 for independents; cigar and tobacco chains have a turnover ranging from 15 to 50, while for the independent the average is from 6 to 12; grocery chains have as high a turnover as 40 with an average of perhaps 25, whereas 12 would be considered about the average for independents. Such rapid turnovers have been accomplished by carrying small stocks and replenishing from week to week from a central warehouse. This policy has resulted in a smaller amount of capital tied up in each store than has been the case with independents, and the resulting capital charges have been less. This is true because the depreciation and storage charges on stored goods are less than on goods that are put on the shelves or counters of the store.

[1] *Printers' Ink*, December 17, 1914.

Chief Weakness of Chain Stores.—The substitution of a hired manager for the owner constitutes the most important defect in the chain store organization. The hired manager does not have the initiative, the incentive, or the same degree of interest in making the business a success, as does the owner of the independent store. He does not maintain the same close personal relationship with the employees as the proprietor. Loyalty to the employer, one of the most valuable assets of the small store, is generally lacking among salespeople in chain stores; the result being a half-hearted interest in the daily work and no incentive to better selling methods.

With hired management controlling the local business, system is designed to take the place of managerial initiative—a substitution which tends to deter men of large imagination from entering the field, especially as opportunities for advancement are limited by a constant tendency to cut down expense and centralize power and control. Consequently managers have to be chosen from the less efficient, who are apt to overlook opportunities to save expense, increase sales, and serve customers; hence it is a question whether the advantages that centralization gains on one hand, may not, on the other, be lost because of the lack of ability or the stifled initiative on the part of its store managers.

Heretofore the average of salaries paid to chain store employees was perhaps no more than those paid by the independent dealer—the large salaries of headquarters executives and supervisors being offset by the low salaries paid to managers and salespeople. With increasing competition from the rejuvenated independent, it is fair to suppose that better managers will have to be secured, which will mean higher salaries to managers. Routine and system are in fact, gradually being subordinated to strength in management, and with competition getting more and more on this basis, the independent is placed at less disadvantage.

Community Antagonism.—Another disadvantage that the chain stores have had to cope with, especially in the smaller towns, is the antagonistic attitude of the members of the community. The chain store has been considered an outsider which takes money out of town. To patronize it was to strike at local prosperity and help to satisfy the greed of "capitalists." In the beginning this antagonism no doubt originated from the merchants, but later on found its exponents in their friends and sympathizers. Those who traded at the chain store were considered enemies of the community, and business and social pressure were brought to bear on them for the purpose of inducing them to discontinue their patronage. The townsman has always been suspicious of the outsider, and this suspicion grew into antagonism when the outsider appeared as a competitor to familiar town interests.

This handicap is gradually being overcome by the character of the service given, and by reason of lower prices. Wherever the manager has been a good "mixer" and has been sympathetic with community projects, contributing store funds whenever other stores thought this policy desirable for the development of local prosperity, a change of feeling toward the outsider has appeared. This acknowledgment of local interests, linked up with square dealing and lower prices, has been the means of building up an increasingly permanent clientele.

Strangely enough, the energetic competition of the chains has served to increase the efficiency of some of the old independent competitors, and with a more progressive front presented to the customer from out of town, a reputation for being a live business town has come to some towns which a few years ago were losing much of their trade to near-by cities or mail order houses. Communities are therefore beginning to forget their antagonism toward chain stores, because they are learning to copy their strong points in their struggle

for existence. The chains are benefiting by the decrease of antagonism toward them; on the other hand, they are finding stiff competition where formerly there was disgruntled indifference. The increase of trade in such towns, owing to the heightened activity of the merchants and the inroads of newly progressive independents, will not tell seriously on the chains. When, however, the new trade becomes more completely absorbed, there will begin a competition between the independents and the chain stores that will determine which is best fitted to survive, or whether both can exist together in peace, harmony, and efficiency.

Future of the Chains.—As long as favorable conditions for the growth of chain stores continue, they can be expected to grow in numbers. As already indicated, the chief stimulus to their growth has been the dissatisfaction of manufacturers with the orthodox system of distribution, which has not afforded as rapid and wide an outlet for the increased production as was desired. That this situation will continue for some time to come seems quite evident. Apparently, relief can come to the manufacturer only by organizing a chain of stores of his own, or stimulating the creation of a store chain by others through the offering of quantity discounts.

Along with this tendency to form chain store systems, is a parallel tendency for chain store systems to combine or consolidate. This is not merely a coincidence but a case of cause and effect. The greater the number of chain store systems, the greater is the outlet for manufacturers' goods. The larger this outlet, i.e., the greater the competition of chain stores to purchase in quantity, the less desirable are the quantity discounts which are offered by manufacturers. In order, then, to get special prices, quantities larger than ordinary must be purchased. In other words, the quantity of merchandise that must be purchased if an extraordinary

advantage is to be secured continually grows larger. In order to be able to purchase larger quantities, larger organizations must be formed; hence the reason for the consolidation of existing chain store systems becomes clear.

An illustration of this tendency was the formation, in 1912, of the F. W. Woolworth Company, to take over the 5 and 10-cent business owned and operated by F. W. Woolworth and Company, 318 stores; S. H. Knox and Company, 112 stores; F. M. Kirby and Company, 96 stores; E. P. Charlton and Company, 53 stores; C. S. Woolworth, 15 stores; and W. H. Moore, 2 stores. Another example was the formation of the United Cigar Stores Company, which secured control of the Riker-Hegeman Company in 1913. Many other consolidations have taken place or are being contemplated. It is very probable, for some time at least, that large combinations will be found in the field of distribution just as they have come to occupy certain portions of the field of production.

The mammoth purchasing power of such chain combinations is worthy of an illustration. The manufacturer of a popular finger-ring, which retailed at 50 cents, was approached by the buyer of a 5 and 10-cent store chain who desired to make a large purchase of rings, so that they could be retailed at 10 cents. The manufacturer ridiculed the idea and said that he was selling plenty as it was—"more than 450 dozen a year." The buyer offered to take 60,000 dozen during the year if they could be sold wholesale to him at a price which would enable his system to sell them at 10 cents apiece and still make a profit. This stupendous quantity was produced by the manufacturer, who had thought that 450 dozen was a large quantity, and these gold-filled rings were retailed in the system's stores at one-fifth of their former retail price. In some cases, chains have purchased the entire output of furniture factories, and of other factories as well, thereby

securing merchandise at prices formerly considered impossible. With a larger output usually goes a lower cost per unit.

Future of the Independent Store.—The advent of the chain store was witnessed by thousands of failures among the small independent retailers. These failures were, however, largely confined to retailers who bemoaned the new competition and did not have the imagination to learn from the chains. The wideawake and progressive retailer need not go to the wall because of the new competition. The buying advantage of the chains can be offset to a large extent by the formation, among retailers, of buying syndicates. Many of the economies of the chains, due to large-scale operations, are not available to the small independent, yet the latter has certain advantages, such as community loyalty, personal supervision of employees, personal contact with customers, and a direct interest in the business, which it is difficult for the chain to secure.

One of the most important advantages of the chain, viz., a scientific accounting system, is available for the small retailer. In many instances the retailers are beginning to see the significance of this control. The rapid turnover, one of the secrets of chain store success, is too often only hazily realized by the independent. Adequate and well-written advertising, as well as well-decorated windows, are features which independents are rapidly adopting. In short, there are only a few advantages peculiar to the chain store, and it is doubtful if even the extensive exploitation of these advantages could bring about the downfall of the small independent store. The latter has its peculiar advantages which the chain is with difficulty striving to acquire. The probabilities are that independent retailers, when banded together in trade associations and instructed by experts in the best methods of advertising and selling, will in the future become most worthy opponents of the chain in the field of retail distribution.

CHAPTER VII

THE MAIL ORDER HOUSE

Retailer's Attitude toward New Conditions.—The mail order, or catalogue, house has grown out of conditions which existed a decade after the close of the Civil War. From the beginning of the nineteenth century up to that time the demand for goods had been increasingly greater than the supply, so naturally more attention had been directed toward the problem of producing goods, rather than that of satisfactorily distributing them. Small-town merchants had grown up in this enervating seller's market, i.e., a market where the advantage is with the seller whether he is the manufacturer or the retailer, and had never taken the trouble to study so much what the local market demanded as what the wholesaler had to offer. The consumer was more or less at the mercy of the merchant and took what the latter had on his shelves, instead of demanding specific brands or styles. The merchant's position was secure, and security bred contempt for changing conditions.

In the early seventies, as production began to catch up with demand, new conditions called for new marketing methods, from the manufacturer to the retailer. As indicated in the preceding chapters, manufacturers and wholesalers were beginning to adjust themselves to the new order. The retailer was more sluggish in his response. This was natural, since he was further away from the source of change—often isolated in remote country communities, and unconscious of the change from a seller's to a buyer's market. Accustomed to give customers what he had rather than to supply what

they asked for, the retailer continued his former policy; and consequently communities gradually grew away from their retailers and learned to look elsewhere for new articles or specific brands of old articles, which they were learning to distinguish and call by name.

Increased Facility of Communication.—When most communities were out of touch with the sources of supply of merchandise, the existence of mail order houses was out of the question. Even if the small-town merchant had not adjusted himself to changing conditions, he would not have been rudely awakened by the rise of mail order competition had not certain new means of communication developed simultaneously. These new methods of communication permitted the mail order house to reach thousands of isolated communities, and therefore may be considered as a condition of the growth of mail order houses rather than as a cause. The cause of the rise of the mail order house was the changing market equilibrium described in the previous section.

Perhaps the development of greatest consequence in the field of communication was the recognition of advertising as an important marketing device. Not only was this realized at about this time, but advertising possibilities were being increased by remarkable developments in photography, lithographing, typography, and the production of print-paper. Devoid of these improvements, the mail order house would be without its most essential weapon of attack—the catalogue. Given the catalogue, the mail order house was ready to perform one of the most important functions of the middleman, viz., the transmission of ideas regarding merchandise. A connecting link was now formed between the isolated farm house and the new source of supply.

Other conditions of communication were necessary before the mail order house could function efficiently. The catalogue

was of little use unless it could be brought to the consumer's home; this accomplished, prompt delivery of orders was of prime importance. Prompt delivery was dependent upon freight, express, and mail service. With the wide extension of railways in the seventies and eighties, followed by a reduction in freight rates; with the expansion of the postal service, culminating in rural free delivery and cheap postage; with the growing facilities of express companies, and finally the establishment of the parcels post system, has gone a corresponding growth of mail order business. Every means of getting in touch with consumers has been put to advantageous use by this new type of retailer, and no doubt the mail order house has helped to stimulate the demand for better means of communication.

Character of American Communities.—Another element necessary for the growth of the mail order house is found in the character of the average American community. While in Europe a community has usually meant a group of town and country people with common interests, the community in this country has come to be regarded as not inclusive of the country surrounding the town. This is partly owing to the fact that country people have not felt that their interests were identical with those of the town people and that a "loyalty" was due to the town about which their farms were grouped. Very often a distinct antagonism between town and country has been noticeable. Hence country people have experienced no compunction in buying from mail order houses when the opportunity was afforded.

This aloofness of our country people has been caused by natural conditions. Farms have been large and opportunities for social intercourse between town and country people have been few. Not meeting often on a common ground, or working together towards a common end, these

two groups have grown apart, and reciprocally ignorant, each has become suspicious of the other. Only too often this delicate situation has been intensified by the rough service accorded country people by retailers and their salespeople. In a survey made of the economic and social conditions in a township in the state of Iowa, it was found that 30 per cent of the people traded almost exclusively with mail order houses, and that an equal per cent purchased part of their goods from this source. When asked why they did not purchase in their neighboring town, several reasons were given, but among the most often repeated was this: "The town people think that they are better than we are."

No doubt the farmer is likewise somewhat to blame for the chasm between country and town. He has not taken part in town activities and has driven in only because of a special need. Even then, he has often been surly and critical of merchandise, and has objected to prices. He has let his bills run for periods of not only months but years. He has allowed himself to become an absentee member of the community until he has been considered an outsider with different interests. Both town and country have been to blame for the lack of harmony; but both have been pioneers building a nation, and too busy to notice the character of its structure. At any rate, this lack of a community of interests was favorable ground for the introduction of the mail order business, which was welcomed by many thousands of country people as a means of emancipating them from the tyranny of the town. Hence the mail order house has aggravated the former situation and made the farmer more independent and conscious of his rights and power. Where he has become independent of the town retailer he has not been backward in saying so.

Character of Mail Order Service.—From what has been said, it is to be presumed that the mail order house is supply-

ing a service, or a combination of services, different from that offered by the local merchant. These services, or distinguishing advantages, constitute a new chapter in the history of retailing, and form significant points of departure from the system of retail distribution which existed from the time of the settlement of this country. They are strictly American in character, and are therefore peculiarly adapted to new world conditions. As conditions change, a gradual modification of these services is going on, but for the last generation they have characterized a new system of retailing which has been gaining strength with each decade.

1. **Wider Variety of Merchandise.**—In the first place, the mail order house affords each customer a scope of selection which is far beyond that which the country merchant can offer. The latter, in his general store, has to keep a little of everything, but he cannot afford to tie up his capital in a large variety of any one line. The same is true to a more limited degree in the small-town one-line store. In the case of shoes, for example, there would be little inclination on the part of the proprietor to depart very far from staple lines, although he might be convinced that there would be some demand for other varieties. In order to keep in stock a satisfactory variety of sizes in the more staple styles, the proprietor's private capital is generally completely exploited, as is also his command over credit. Those customers who desire to pick from a large stock are therefore usually disappointed. Very often the merchant realizes that this dissatisfaction exists, but he feels that he cannot lessen it.

This limitation of the local store has not diverted country trade to mail order houses so much as town trade. In the towns even the wives of merchants handling ladies' ready-to-wear apparel and other lines have sent to mail order houses for their goods. It has never taken long for a lack of confi-

dence in the local store's merchandise to spread, until a large percentage of town trade has gone to mail order houses. In such cases, the town merchant has been discredited by the exercise of a powerful human instinct—the instinct of imitation.

If townspeople merely sent out of town for goods which are not on display in local stores, a comparatively small amount of damage to town trade would result. Once embarked in sending mail orders, however, the housewife has enlarged her order to include many articles which formerly she had no intention of buying elsewhere than in the town stores. Gradually the habit has developed, until in some towns large numbers have come to make a practice of sending away for merchandise that is to be found on the shelves of stores within three blocks of their homes. After such orders have been sent, the housewife feels that the merchants know what she has done, and she is even more loath to go to the local store for articles which she never intended at first to buy from mail order houses. Thus the situation is aggravated, and distrust or open antagonism is developed among citizens of the town.

2. **Low Prices—Loss Leaders.**—The mail order houses have followed a consistent policy of creating the impression that their prices are lower than the prices asked for the same goods in local shops. For many years the mail order catalogue has listed its prices opposite "store prices" (often fictitious), thereby subtly prejudicing the consumer against goods distributed through stores. Recently, the Federal Trade Commission has issued an order against this practice on the grounds of "unfair competition," and it would seem that the mail order house has lost a distinct advantage with the passing of the privilege of price comparison.

The impression of universally low prices has also been

successfully instilled in consumers' minds by the liberal use of loss leaders. Well-known brands, like Winchester (rifle), Ingersoll (watch), Big Ben (clock), and Victor (top), have been prominently displayed in mail order catalogues at prices below the widely advertised prices fixed by the manufacturer. Customers have reasoned that if these well-known articles could be sold at lower prices than are customary in stores, other less known goods could likewise be sold below store prices. Unfortunately for the customer, his assumption in this respect has quite frequently been false; the higher prices at which he has purchased obscure brands have offset what he has saved on the well-known loss leaders.

The use of loss leaders has not been an advantage of the mail order houses exclusively, but they have made use of this selling device so thoroughly and systematically that it has come to be considered a part of mail order policy. The larger retail stores, for the most part, have used loss leaders as consistently as mail order houses, but the small store (the mail order house's weakest competitor) has been negligent in meeting the prices of outside competition. The latter class of dealers has apparently thought it was good merchandising to attempt to procure, so far as possible, a uniform percentage of gross profit. Their failure to accomplish this end indicates that good merchandising requires first of all the meeting of competition, and, in the last analysis, this means the supplying of what the customer wants, at a price, time, and place which are most convenient for him.

Low prices may be more than a pretence. They have in many instances been attained because of certain economic advantages peculiar to mail order organizations. In some cases the output of whole factories has been purchased, while in others the factory itself has been brought into the mail order organization. All of the advantages of large-scale distribution, and even of integration, have tended to lower the

per unit distribution cost. Yet these advantages are not absolute; they may be more than offset by certain existing disadvantages which have always begun to operate as soon as competing stores have realized their own elements of strength.

3. **"Different Goods."**—A third characteristic of the mail order house which gives it a preferred position in the minds of numerous country people, is its ability to offer goods different from those found in the average country general store or small-town specialty shop. It seems to be a fundamental trait of human beings to desire that which will distinguish them, give them individuality, or set them apart from their fellow-men. General stores have adhered to staple lines for the most part, and have therefore ignored rather than played up to this human instinct. It remained for the mail order house to satisfy this underlying demand and liberate large numbers of people from the hampering uniformity of local conditions.

Irrespective of how much this liberation was desired, it could not be realized until certain economic conditions had been changed. Since the early days, the farmer had been dependent for credit upon the country store. Bills were paid twice a year, or even once a year, depending on how crops were sold or live stock marketed. The farmer could not purchase from mail order houses because he did not have the cash, and he had no established credit with them. He was therefore forced by conditions to purchase all of his goods through local channels, even though he might prefer goods from other sources. With rising prices of farm produce, however, and greater economy of production, owing to farm machinery, the farmer's standard of living began to rise and yearly savings became possible. These savings, together with the rise in land values, gave the farmer ready cash or credit

and this, in turn, had the tendency quickly to emancipate him from the necessity of purchasing his goods from dealers in his own community.

Not only was there an underlying demand for different goods; there was also a demand for an opportunity to shop—to appraise competing values. City people were enabled to gratify this desire by reason of the large stores which were established in large centers of population. This advantage, however, was not to be found elsewhere. Large portions of the country's population were unable to see and hear about the modern appliances and changes in styles which have come to dominate people's minds during the last generation. The mail order catalogue opened a closed door for millions of people and gratified their desire to shop. This was the best substitute for city shopping which had heretofore been devised. It was instantly successful. The justification for its initiation and continuation rested on the ground of satisfying a demand. Its success will last only so long as it continues to perform this function.

4. Definite Merchandise.—A fourth advantage of the mail order house has been its policy of creating definite values. This has been accomplished by accurate descriptions. Whereas the smaller stores have been content with giving superlatives and generalities which confused rather than created values, the mail order houses have spent much time and money in working out the values of their goods and presenting these facts in a clear-cut, intelligible manner. They have apparently realized that value has not been created until it has been created in the minds of the ultimate consumers. The poor salesmanship of many stores stands out quite noticeably when compared with the descriptive selling appeals of the catalogues.

How mail order houses create definite values by means

of accurate description is illustrated by the following advertisement of an incubator:[1]

> Imperial Incubators have cases of select California redwood which will not warp. The walls are double and thoroughly insulated. Cases are put together in a special way which prevents joints from opening up under damp conditions or long usage, a very important point. Doors are double and snug fitting. Glass windows in doors permit inspection of entire egg chamber. Egg trays very strongly made and will not sag. The sizes over 120-egg have two trays. Chicks drop down into warm nursery under tray when hatched. The regulator is entirely automatic and controls heat perfectly. The thermostat which operates the regulator is the very latest expanding water type. High-grade thermometer and lamp with each machine. Steel heater parts are enclosed in special chambers within incubator case, conserving the heat. Patent egg-turning rack furnished at small extra cost. Turning rack reduces capacity of tray about one third. Imperial Incubators furnished with either hot air or hot water system. Satisfaction guaranteed.

Hardly comparable with such a definite description of value, is the advertisement which appeared in a country newspaper not long ago:

> Now is the time to think about incubators. Come in and see our complete line. John Smith and Company.

A certain farmer confessed that the reading of this advertisement stimulated him to think about incubators, but since there was nothing to think about in the advertisement, he sought the mail order catalogue where he read the description just referred to. Not being able to take the time to examine the incubator in the town store, he ordered one from the mail

[1] Sears, Roebuck and Company, catalogue, 1918.

order house. Many similar cases could be cited to show how defective advertising and salesmanship in stores have been the means of turning business to mail order houses.

Appeal to Imagination. Mail order salesmanship has not been content merely with describing merchandise, it has appealed to the imagination of the customer and has pictured the merchandise being used by him. The advertisement of a certain mattress illustrates the point: [2]

> This mattress is smooth, even, springy, as soft and buoyant as a feather pillow. Made with a smooth, even surface, no tufts of any kind being used, it fits itself snugly to every curve and line of the body. You do not rest upon the "high points" as with the ordinary mattress. This provides absolute relaxation for every muscle—producing the most restful, refreshing sleep.

On asking to look at mattresses in several stores, the writer was told that they were: "good values," "the best made," "the best sellers," "guaranteed to give satisfaction," "great stuff," and "well-made." Glittering generalities prevailed, and any attempt to create a conviction of value in the mind of the customer was lacking. The glib use of worn-out words and expressions took the place of specific, tangible, valuable information, which alone makes intelligent buying possible. In a very ineffective manner, an attempt was being made to sell mattresses, while the mail order house seemed to realize that the mattress was only a means to an end, and that end was "restful, refreshing sleep." In other words, the selling of a certain kind of sleep was the prime object of the mail order salesmanship, and because of this visualization of the customer's interest, it was the more successful of the two methods.

It may be said that the mail order houses are forced to

[2] Sears, Roebuck and Company, catalogue, 1918.

use minute and accurate descriptions of their merchandise because they cannot show it, while such a method is unnecessary for the average store, since the customer can handle the goods and ascertain their value to his own satisfaction. The fact remains that people only see that which they are educated to see, and unless value is created in the mind of the customer, it very often does not exist at all. It is probable that in their minds many customers see and recognize the value of some mail order merchandise more clearly than with their eyes they would see the form and value of similar merchandise if it were placed in their hands in some store. In other words, the mail order goods often "look better" to the customer than do the goods being sold in stores, when, in reality, the difference in intrinsic value between them is negligible.

5. **Service.**—A fifth advantage of the mail order house is found in its ability to give certain kinds of service which are demanded by an increasing number of people, and which have been overlooked by many stores. One of these is courteous treatment. In thousands of stores customers are never thanked for the business which they bring. They are never made to feel that their trade is appreciated. They are treated with gruff, overbearing, ungraciousness which gradually lessens their good-will toward the store. These dissatisfied customers experiment with mail order buying and generally find what they have been craving—kind, courteous, sympathetic, and human treatment. The demand for this kind of service may never have been conscious, but it has been a demand nevertheless; and its satisfaction binds the possessor of the demand to the source of this satisfaction.

A mail order letter usually starts out with: "Your valued order of the 10th received." Then it goes on exhibiting appreciation of the order; explains that above all things the mail order house desires to give satisfaction; gives special

information of value to the user of the article; and finally, definitely thanks the customer for the order and thereby keeps the trade channel open for further business. The customer's interest is kept paramount, and if there is any controversy, the customer is usually permitted the benefit of the doubt. In fact, the largest mail order house in the country allows all customers' claims under a certain amount without investigating their validity, as it has been found by experience that most customers are honest; where the opposite is true, what would be saved is more than offset by the expense of investigation.

Cheerfulness, Tact, Enthusiasm. Besides courtesy, the mail order houses inject cheerfulness, tact, enthusiasm, and other positive qualities into their correspondence. The customer feels that he is dealing with somebody, and not merely with something. The mention of his name in the letter individualizes him, and flatters him in a subtle manner. How often in stores is he merely one of many customers to be grudgingly "waited on"? How often does he wait while salespeople carry on their gossip and tell their little stories? How often must he stand around, growing impatient, while the proprietor or his salespeople finish their tasks of sorting goods, cleaning or inventorying stock? After seeing the service, or lack of service, in many of our stores, it is little wonder that many people prefer to send by mail for goods, even though their coming will be delayed by the exigencies of express or freight service. They at least know that any delay in arrival will be to causes beyond the control of their favorite mail order house. They figure on a lapse of time before arrival, and therefore are not disappointed because they cannot get the goods immediately.

Notwithstanding delays, misunderstandings, and a great deal of inconvenience incident to ordering by mail, many people feel that these are small matters compared with dis-

courteous treatment in stores. When the customer is offended by an organization, he will go to almost any extremes to cease trading with it and to buy from one that pays him reasonable deference. Many disagreeable features may characterize the newly formed trade relations but the customer will overlook these if they do not infringe upon his self-respect. Many stores are realizing this weak spot in their organization, and are instructing their salesmen how to handle the customer so as to give him satisfactory service.

6. Guaranty.—A sixth advantage of the mail order house is one not merely of facilitating the sale of goods, but of keeping them sold. The prominently displayed guaranty of one mail order house reads as follows: "We guarantee absolute satisfaction. Promptly return to us, at our expense, any unsatisfactory purchase. We will then either exchange it for what you want, or return the full amount you have paid, together with transportation charges." People know that this guaranty means just what it says, and confidence is built up in assertions which have no means of immediate verification. Risk is minimized and value enhanced. Skeptical customers become convinced that there will be no chance for future regrets if they place an order. Goods which would otherwise with difficulty be sold, such as those requiring matching of colors, accurate fitting, and the like, are purchased without so much as a second thought.

When the merchandise is not exactly what was expected, or when it does not meet the needs for which it was intended, the guaranty produces an interesting psychological situation which tends to minimize returns and exchanges. The guaranty is such a positive assertion of the value of the merchandise that the customer is led to believe, even against his better judgment, that it is all right in spite of his fears to the contrary. In other words, when it is made easy to return

merchandise, customers in most cases feel that it would not be to their advantage to do so. But when difficulties are thrown in the path of returned or exchanged goods by retail stores, the customer feels that it is to the advantage of the store to prevent such returns and exchanges, and hence it must of necessity be to the disadvantage of the customer.

Creating Demand.—While stores in many cases have been satisfied with merely taking orders and only haphazardly displaying their merchandise, mail order houses have taken the initiative and sought to create demand for their products. Labor saving devices, new appliances, modern inventions, improved equipment for home and farm, efficiency devices, and hundreds of other general classes of articles have been held before the customer's eye until he has extended his standard of living by purchasing them. By following this aggressive policy, the mail order house has been enabled to increase its sales, when retail stores were standing still waiting for customers to call and "ask for" the goods that were being carried by the mail order houses. Numerous cases are known where customers have told of the wonderful "new" article they were able to buy at a mail order house, when investigation showed that the same or a similar article had been occupying the shelves of a near-by store for months and even years. Stores have not pushed new merchandise as they should, and have only too often become the purveyors of staple commodities which require little effort to sell. Here, again, the mail order house merely came forward and satisfied a demand —by creating a demand for the out-of-the-ordinary.

CHAPTER VIII

THE MAIL ORDER HOUSE (CONTINUED)

Economies of Operation.—By satisfying a demand which the local merchant had ignored, by supplying commodities with distinctive qualities and at professedly lower prices, the mail order house has come to enjoy six outstanding advantages:

1. It is equipped with unusual buying power.
2. It often can avail itself of secret discounts.
3. Its cash policy insures it against losses.
4. Its charges to capital expense are less because of its rapid turnover.
5. It specializes its managerial functions.
6. It can sell its goods in a world market.

As the present chapter develops, it will become clear that the advantages of the mail order house are very largely the disadvantages against which the local merchant has to contend.

1. **Unusual Buying Power.**—Because of its size, the mail order house is often able to buy up the entire output of a factory. With all the worry of marketing his product removed the manufacturer is willing to make a price which insures him his costs, plus a small net profit. If his risks and costs of marketing were greater, he would have to ask more for his product. Where a large supply of goods cannot be secured at a less-than-the-market price, the mail order house may purchase a factory that is unable to operate successfully, or it may build its own producing plant. In either case it obtains

a supply of merchandise through avenues which, to many thousands of stores, are unavailable.

Another source of cheap goods is daily discovered by an army of buyers who keep in touch with manufacturing conditions all over the world. These men make it a business to know: when any manufacturer has overproduced; when any manufacturer needs money; when jobbers are narrowing the market for certain products; when changing demand will produce obsolescence; and when many other conditions may arise to permit bargains, reductions, or special prices. These business scouts are bound to no rigid or customary channels of supply, as are many retail stores. They are free-lance buyers and shop before they purchase mail order goods.

2. **Secret Discounts.**—In some cases, the mail order house has been able to buy more cheaply than competitors because of secret discounts. This is a form of unfair competition and has been vigorously fought by jobbers and retailers. Organizations of these latter middlemen have been formed to boycott manufacturers who carried on such a practice. Where it has been impossible to get evidence of secret discounts, but where it was strongly felt that they were given, retail organizations have refused to buy the manufacturers' products, and the latter have suddenly realized that 90 per cent of their market had disappeared and that their only customer was the mail order house which now was demanding further concessions as the only basis for increased purchases. Because of the fear of what retailers will do through their organizations or jobbing associations, many manufacturers will not sell to mail order houses and endanger perhaps nine-tenths of their business for the remaining one- or two-tenths. The source of supply of some products is not open to mail order houses to such an extent as it is to stores, but the number of these unavailable products is small.

3. Safeguards from Loss.—By adhering largely to a cash policy, mail order houses have been saved from the burden of bad debts, which is often a fatal handicap for the small store. Along with this advantage has gone the simplification of keeping accounts, as well as the accumulation of large funds of cash which can be used to take advantage of daily market conditions. Where credit has been extended on larger purchases, such as pianos, furniture, and machinery, the risks have been previously carefully investigated so that the chances of loss were small. A vigorous collections department keeps credit customers posted as to the date payments are due, and failure to meet payments brings follow-up letters at regular intervals which become more determined in tone until payment is made or suit is commenced. Even with these safeguards some losses result, the average for mail order houses of all types amounting to about 1 per cent.

With the average small retailer the loss through bad debts is often two or three times this amount. Where the retailer knows his customers personally, he is often reluctant to send bills for fear of offence. Bills running from six months to a year are not uncommon in some farming communities, although since the Great War the tendency has been to shorten credit. In the stampede for more customers, credit is often extended without any previous investigation as to willingness or ability to pay. Because many communities are without a credit-rating bureau, it is possible for credit customers to incur obligations at one store until their credit is shut off, and then proceed to the store across the street and perform the same process. Besides these disadvantages arising from the misuse of credit, from 10 to 50 per cent of the gross sales are represented in the ledger instead of in the cash drawer, and the store is handicapped in taking up its discounts, or in assuming advantages that the immediate market may afford.

4. **Rapid Turnover.**—The charges to capital expense are reduced materially owing to the rapid turnover of goods. Sometimes the larger and more expensive goods, or goods of special make or design, or merchandise infrequently called for, have not yet been manufactured when the order and accompanying cash arrive for their purchase. Hence the raw materials and labor cost which go into the product may be paid for with the customer's money before the product is manufactured. In other words the customer is made to supply the manufacturing capital, instead of the mail order house. Or it may be that the article ordered has been manufactured only recently and is stored at the place of the manufacturer. If such is the case, the article can be shipped direct from the factory, thereby saving transportation charges from the factory to the storerooms of the mail order house, and lessening the time during which capital charges would operate. Of course large volumes of merchandise are stored at the central warehouses, but these are constantly kept moving so that capital is tied up in a commodity for the shortest possible period before it is sold. Capital, as well as the other factors of production and distribution, is made to operate efficiently.

The tendency for smaller stores has been to purchase merchandise in quantity lots because of special discounts or other inducements that were offered. This policy has served to tie up the limited amount of capital available, and has made impossible the carrying of a larger variety of goods. When the purchases have been unchanging staples, no further loss has resulted; but instances are common where large quantities of certain articles have been purchased only to become "stickers," by reason of the changing character of demand. One merchant was found to have several shelves full of fancy kerosene lamps, although his community had had electricity for ten years. He was inventorying them at full value and kept them displayed in a prominent place in the center of

the store. Another store had a large number of ladies' cloaks which had accumulated during seven years. They had been purchased in dozen lots instead of lots of two's and three's. In the larger stores, the small purchase and quick turn has been common for years, but the small store still adheres to a buying policy which handicaps it in its competition with the mail order house, the department store, and the chain store.

5. Specialization of Management.—The mail order management makes great savings through specialization of functions. Each duty is divided and subdivided so that the performer may become a specialist. Matters of routine are directed through specialized subordinates, thereby giving those with managerial ability an opportunity of seeing the broad aspects of the business, and the time to plan and work out more economical methods of procedure. On the other hand, it is a common sight in a retail store to see the proprietor sweeping the floor, opening crates, decorating windows, waiting on customers, buying goods, or doing the hundred and one things which have to be done in the average store. In some cases the business is not large enough to permit of anyone's time being occupied in only one phase of merchandising, while in other cases the proprietor has fallen into a rut and is performing manual duties and detail operations which could be turned over to those less qualified for management.

Besides specialized management, the mail order house has the advantage of a higher grade of management. It can employ the best men to fill positions of responsibility. These men, having greater foresight, ability, and judgment than the small retailer, naturally see ways of improving their advertising, selling, buying, and general direction of business, all of which is a closed book to those less well endowed. In merchandising, as in almost every other form of business, there is a competition of brains. The department stores and

chain stores are equal competitors with the mail order houses in this respect, but the small retailer very often does not have the training or the ability to cope successfully with rapidly changing and complex market problems.

6. World Markets.—By selling goods all over the world, the mail order house is independent of local depressions or catastrophes. It is not vitally affected by local boycotts, and movements against it have difficulty in spreading to unaffected districts. Its buyers take advantage of the differences in the prices of raw materials in widely separated markets, since the trend of events over a wide area is discovered in time to make successful adjustments. Such elimination of uncertainties makes possible a more intelligent use of capital and provides a basis for broad planning. The local business is always at a disadvantage in competition with the nationally and internationally conceived institution.

Cost-to-Sell. — Notwithstanding the many advantages accruing to the mail order house, the cost-to-sell (often known as the cost of doing business) is much the same as it is for some kinds of specialty stores. For the mail order house it averages close to 23 per cent, which is explained by the fact that one item, advertising, is very much higher than in the average store, amounting in some cases to 10 per cent and seldom falling below 6 per cent. The advertising expense for the average store is, perhaps, not more than 1 per cent. In small stores it hardly ever amounts to more than ½ per cent, while in the larger concerns 1½ per cent is usually considered a liberal appropriation.

Comparisons of the cost-to-sell of mail order houses with stores carrying certain lines of goods are as follows: the mail order cost-to-sell is about 5 per cent higher than the average grocery cost-to-sell; it is about the same as that

of dry-goods, ladies' ready-to-wear, furniture, and shoe stores; it is 1 or 2 per cent higher than that of hardware stores; 4 per cent lower than for men's clothing shops; 5 per cent lower than for jewelry stores; and about 4 per cent lower than for department stores.

Of course, the cost-to-sell varies with different mail order houses, as it does with different stores. One mail order official stated that it ranged from 16 to 25 per cent.[1] Considering all the lines that it handles and what it would cost to sell them in stores, it is probable that the mail order house has no lower cost-to-sell on the average than the stores. What it saves on rent (1 or 2 per cent) and salaries (about 4 per cent), and on other items, it spends in a larger outlay for items like advertising. It would seem that the advantage of the mail order house lies elsewhere than in its lower cost-to-sell. Most certainly is this the case when the mail order house is compared with the country store where the cost-to-sell is lower than the average.

Advantages of the Local Merchant.—The economic disadvantages of the mail order house might be designated as the advantages of the local merchants. They constitute the grounds on which the country merchant may regain lost trade; they narrow the scope of mail order business; they embrace possibilities for expansion, and may, in the future, be the means of revolutionizing present-day retailing methods. Six of these advantages are considered in the present section.

1. **Physical Inspection of Merchandise.**—Even though the trend of marketing is toward selling goods by description rather than by the more cumbersome and expensive methods

[1] Wm. C. Thorne, vice-president of Montgomery Ward and Company, before the Parcels Post Sub-committee of the Senate Committee on Post-Offices and Post Roads, January 3, 1912. Superintendent of Documents, Washington, D. C.

of sample and bulk, yet large numbers of people desire to inspect the goods before they purchase them. This advantage, afforded by stores, has not been utilized to the fullest extent because only surface qualities have been exhibited and poor salesmanship has neglected to create the true value of the merchandise in the minds of customers. The clever descriptions of mail order catalogues have enabled the customer to see the merchandise more clearly than when similar merchandise was physically inspected in some store. If stores will physically exhibit goods and at the same time accurately recreate their value by means of attractive descriptions, mail order houses will be at a distinct disadvantage in comparing values favorable to themselves.

2. **Immediate Delivery.**—The delay in securing what is needed deducts from the utility and value of mail order goods. That the customer always pays for such delays is not generally clearly understood. Stores have an opportunity to "sell" this idea to the public by means of advertising and general publicity. If the average customer sees the ebb and flow of values in the concrete purchases of everyday life, he will probably in some cases change the source of his supply. A price can be judged only by the utilities which it purchases; if the price is low the utilities are usually low, and if the price is high there is a presumption of greater capacities to serve the user. To make the customer see these utilities, is the weapon offered store publicity and salesmanship with which to meet mail order competition.

3. **Personal Service.**—Personal service has a distinct advantage over impersonal service. It caters to the vanity of customers and provides a warm human contact between buyer and seller when rightly applied. The store is able to adapt itself to the whims of customers and thereby to individualize

its service, while the mail order house must necessarily standardize its operations. Personal friendships and understandings which arise between buyer and seller make for agreeable and permanent relationships. The store with an attractive and friendly force of salespeople who are continuously looking out for the interest of the customer, is hard competition for the mail order house with its distant and impersonalized force of correspondents. An increasing number of stores are beginning to realize their inherent advantage and are building up attractive personal service and relationships.

4. **Community Pride.**—The majority of citizens in a small town or city are interested in building up the community. This is true because their entire future rests with the development of their environment. Not only retailers, but doctors, lawyers, teachers, preachers, and others are trying to increase their patronage. To show, as can often be done, that no advantage accrues to the individual by purchasing from mail order houses and that community development is handicapped, tends to arouse community patriotism which in some cases has gone far to reduce the amount of merchandise purchased from out of town. As our communities grow older and their sense of citizenship becomes more spiritually solidified, a common understanding may develop which may resent any outside trade intrusion that does not economically better the customer and that saps the vitality of local business interests.

5. **Retail Store's Use of Mail Orders.**—Because the farmer has become accustomed to purchase by description through mail order catalogues, some merchants in the Middle West have endeavored to adapt themselves to this situation and to modify it to their own advantage. Mail order catalogues are now being sent out regularly to farmers even by many of the smaller merchants, and when the descriptions have been

interesting and accurate and the illustrations attractive, the local merchant's claims have been looked into before orders have been sent out of town. The construction of such a catalogue has led merchants to analyze their goods carefully in comparison with mail order articles, and they have been surprised to find that, quality for quality, they could offer equal value for the money.

These mail order departments established recently by some retail stores, have the advantage over the distant mail order houses because they permit of prompt ordering over the telephone and prompt delivery by means of truck or parcels post. Long delays, the writing of letters, or the making out of orders (a difficult task for many people) are eliminated; and at the same time the customer is made to feel that he is part of the community and not outside of it. There is little doubt that the retail store's use of the mail order is only in its infancy, and that this method of making business connections with the farmer will prove to be increasingly productive.

6. **Rapid Development of Transportation.**—The local merchant has secured a distinct advantage over the mail order house in the last decade due to the extraordinary development of local means of transportation. The institution of the parcels post gave a distinct impetus to mail order business, but this advantage has been more than offset by the introduction of the automobile and the laying of good roads. The isolation of country districts, a fertile field for the mail order catalogue, has practically disappeared or is rapidly disappearing with the advent of state and national road-building programs. As regards communication and transportation, forty miles are now, in a great many districts, no more than five miles formerly were; and with increased prosperity, leisure has prompted the farmer to make more frequent trips to town with cash, instead of a charge book, in his pocket.

This revolution in means of communication is likewise setting in motion a readjustment among centers of population which is having an important bearing on the survival of the fittest among retailers. Formerly, the country merchant had to meet stiff competition from mail order houses, but he was quite free from neighboring town competition because of the bad condition of the roads and lack of rapid transportation facilities. Now he is subject to the competition of the neighboring town retailer as well as to that of the mail order house. Battered from near and far, he is rapidly succumbing to the more efficient merchants in the larger towns and cities, who are not only increasing their business because of improved facilities of transportation, but are also capturing mail order business in their own trade territory. Concentration of population is thus increasing the mortality of retailers incapable of adapting themselves to the new situation, and is building up larger and more complex types of retailers in our small county seats and large cities. These larger retail units seem better able to present those services, conveniences, and attractions which go far to offset the lure of the mail order catalogue, and to maintain and keep up to date more complete stocks of merchandise. With the possible advent of the aeroplane as a practical and cheap means of transportation, it is easy for the imagination to call up further readjustments of population in the future, which will carry with them to a hitherto undreamed of extent a corresponding transformation of the retail middleman.

"Taking Money out of Town" Argument.—The stock argument of those interested in the retail business, against purchasing goods from mail order houses, is that it takes money out of town. Economists have answered this from two standpoints: First, the supply of money itself, the circulating medium, is not depleted by such purchases, since money is

not shipped out; the purchases are made by means of credit instruments which are satisfied ultimately by the offsetting of debts between districts. Second, a community from which mail order business is sent is no worse off because of this business but rather better off, since it is presumed that for each dollar sent out an equivalent in value is received which in any case would be more than could be secured for the same dollar from the stores of the community.

While the first answer to the argument is undoubtedly true, the second will stand some inspection. If the customer always secured more for his dollar by purchasing from mail order houses, the community would undoubtedly be more wealthy because of such action. But, on the other hand, if he secures no more for his dollar, local trade languishes and the town becomes of less importance as a trading center and ultimately as a place of residence. Whether or not the customer secures more or less for his dollar from mail order houses is a matter of expert opinion brought to bear on an individual case, and not of "common belief" to be universally applied. Customers do not know merchandise; this is one of the first facts that strikes the merchandising student. Leathers, fabrics, tools, instruments, furniture, and scores of articles are so complex in style and construction that only those who have made a careful study of each line are in a position to give an intelligent opinion.

Recently, an expert in merchandise said that for every article in the mail order catalogue which was cheaper than a similar article sold in stores, he could show an article in the mail order catalogue which was dearer than a similar article sold in stores. Perhaps there is a good deal of truth in the assertion that the total values for similar articles in stores and mail order houses are the same, but that manipulations of price apparently make one middleman's offers more attractive than the others. If this were the case, there would be

only an apparent advantage accruing to the customer who traded exclusively with mail order houses. On the other hand, it is likewise true that a customer might gain by skilfully purchasing those values which were greater for each dollar expended as compared to the values in the retail store. Whether or not there is an advantage or disadvantage in the case of any particular purchase of other than staple goods, must remain a matter for expert decision. But in forming a decision it must be remembered that convenience, permanent supply, favorable means and time of payment, and personal satisfaction must be considered as part of the utilities of the merchandise. When all factors are considered, an extremely complex situation presents itself which places in a precarious position any snap judgments which may be formed.

CHAPTER IX

RETAILER'S MARKET ANALYSIS

Analysis in a Buyer's Market.—Retail marketing costs constitute the largest percentage of the "price spread" existing between the manufacturer and consumer. One of the many reasons for this condition is the lack of an analysis of the quantity and quality of merchandise which any market is capable of absorbing. For the most part, retail purchasing has developed along narrow lines. During the past century, the dominance of a seller's market made unnecessary a close scrutiny of market peculiarities, or even an ascertainment of the degree of market saturation relative to any particular line of goods. The advantage was with the seller of merchandise, and the customer took what he could get. At the present time, however, with a more sluggish but more discriminating demand, retailers are being forced to investigate their market possibilities in order to insure a ready absorption of the growing abundance of a product. Where such market analyses are not being made by retailers, they are by wholesalers, and in some cases by manufacturers. For whoever makes the analysis, the important object is a determination of the consuming power of the population as to quality and quantity of goods.

Inefficient Retail Purchasing Methods.—The methods employed by many retailers in purchasing their stocks of merchandise, indicate their failure to realize the tremendous reversal in market emphasis which has developed within recent years. Custom still dictates the character of much retail

purchasing, although the increasing pressure of goods is making itself felt in some districts. In the prevalent retailing system, however, there are five outstanding defects each of which will be given separate consideration, and in the following order, in the present chapter.

1. Long-time credits, discounts, bargains, or special prices on large orders influence the valuation of goods offered by the jobber or the manufacturer.
2. The purchase of certain lines of goods has been based on friendship for the traveling salesman.
3. "Standard" goods carry no advantage in some markets, yet retailers often purchase them because they consider them "standard."
4. For some merchants, the purchasing of certain lines of goods is based on habit.
5. Some merchants purchase from certain jobbing houses because of a feeling of obligation toward them.

Unless the defects are rapidly eliminated by scientific market analysis the tendency toward integration will become more pronounced, and, as a result, independent retail units will become of less importance in the marketing system.

1. **Purchasing Based on Special Inducements.**—The first defect to be considered in present retail purchasing methods is the selection of goods because of special inducements such as long-time credits, quantity and extra discounts, and bargains, offered by the jobber or manufacturer. Each of these chief inducements to divert the retailer's attention from a scientific appraisal of his market, and the effect on retailer, jobber, manufacturer, and public of the overstocking which results when such inducements are allowed to exert undue influence, are taken up in detail in the sections immediately following.

Long-Time Credits.—The number of merchants who are attracted by the idea that they can buy now and pay for the goods in one, two, or even three months,[1] and, in the meantime sell the goods, is surprising. If the trade is going to come into a store and demand that line of goods, the results of such a policy are satisfactory; but if the public does not desire this particular line, or changes its mind about it, then the goods are on the merchant's hands and will have to be sold at a loss.

There are several unknown quantities in the equation of buying, and the nature of the demand is one of these. When goods are purchased on long-time credit, the retailer rarely attempts to determine the unknown factor. He assumes that the goods will be purchased by the public within a certain time, but does not command evidence to substantiate this assumption. Forced sales and loss result. What this loss would amount to for all merchants throughout the country, one could only hazard a guess, but that it would be tremendous no one will deny.

Quantity Discounts.—Offers to the merchant of special prices on large orders have been productive of short-sightedness in buying, and account, in many instances, for large stocks of goods that fail to move from the shelves. Only one who has seen the tremendous overstocking of goods among the merchants in the smaller towns can understand what a dead weight rests on the backs of the majority of retailers, and yet they almost invariably believe that they are saving money by buying large orders. Only rarely has one of these merchants been heard to admit that he was overstocked, and even then, nothing more than a guess could be made as to what lines were in excess. This lack of knowledge of the existence

[1] Ninety days' credit is almost obsolete now.

of overstocking makes education along this line especially useful, and, where it has been given, flatteringly productive.

Turnover versus Quantity Discounts.—That the merchant in most cases[2] loses money by this method of purchasing can be shown by an illustration. Suppose a merchant every month buys a dozen of an article that costs him 75 cents per dozen, and sells a dozen every month at the price of $1. At the end of the year, this merchant has turned this 75 cents twelve times, making 25 cents every time, or, in other words, has made $3 on an investment of 75 cents. Then a specialty salesman comes along, and says: "You are paying too much money for those goods. I can sell you that same article for $6 a gross." It looks like a saving, so the merchant takes a gross. During the year following this purchase he sells a dozen a month, or the entire gross, at a profit of $6. In other words, he has made $6 on a $6 investment, or 100 per cent, while under the former method of buying he made $3 on a 75-cent investment, or 400 per cent.

When it is acknowledged that this hypothetical case represents actual conditions and could be multiplied by many lines in any one store, it will be realized what a tremendous saving could be effected by a different method of buying. Instead of permitting the $6 to carry one line, it should be more fully utilized and made to carry twelve 75-cent lines. The jobber would be forced to function as a warehouse instead of the store, making not only for better appearance of the latter, but for larger retail profits.

Overstocking—Failure.—Thus it must be evident that all parties concerned, the jobber merchant, and the public, would

[2] During a period of rising prices this method of buying can often be justified to a limited extent, but if carried very far becomes speculation pure and simple. The buyer then tries to liquidate before a falling market brings him loss, not merely in sales, but in inventory.

benefit by a more rapid turnover of stock. The jobber cannot hope to build up a permanent trade by stocking merchants with goods that will not move. He may make immediate gains, but this policy continued will force his customers to the wall and make necessary the formation of trade connections with new dealers. Unfortunately, jobbers are only too often short-sighted and persistently continue to "load" merchants until the latter are forced into liquidation. Often the direct cause for such failures is not ascertained by financial investigators, and classifications such as "lack of funds," "incompetence," or others equally inaccurate are used to indicate the reasons for insolvency, when, in reality, these are only conditions of failure—not causes. On the surface, "lack of funds" often appears as the fundamental reason for going out of business. This condition, however, is caused by wrong buying methods; most merchants have sufficient capital to carry the necessary number of lines and meet contingencies, but instead of conserving it, they let much of it lie idle.

Overstocking—Inefficiency.—But even if it is to the advantage of jobbers to overstock retailers, or if they continue this policy against their own interests, because of the ignorance of their salesmen or for other reasons, it is plainly to the interests of the merchant to thwart such attempts whenever possible. When overstocked the merchant is handicapped by lack of capital; his profits are lower; the number of clearance sales with all their attendant disruption of routine are increased; the appearance of his store is less suitable for attracting trade; the congestion of stock often interrupts the speedy finding of goods; and most important of all, his salespeople forego the stimulating effect of the frequent arrival of goods.

The Public's Interest.—The public is too interested a party to permit such a condition of affairs to continue. Buying

in this manner means fewer goods than might otherwise be offered to customers, poorer service, loss of time, and higher prices. The latter is true because the interest charges on the stock are greater, and in many cases a lack of funds caused by this inefficient use of capital prevents taking up discounts the use of which would have permitted a lower selling price. A growing realization on the part of the buying public of the disadvantages of such methods of buying gives promise of better conditions. But greater progress can be made if retailers will quickly realize their responsibility as public servants.

The Manufacturer's Interest.—The manufacturer also is vitally interested in the purchasing methods of retailers. Slow-moving stocks mean less ready capital with which to pay bills promptly and purchase new stock. With unattractive goods customers are not exploited, and only partial saturation of the trade territory results. This slowing up of the stream of goods is causing manufacturers to make investigations of the consuming power of communities, so that the retailers may be stimulated to study their opportunities and make more intelligent purchases. The retailers must speed up their selling or meet the competition of speeded up retail stores owned by manufacturers.

Extra Discounts.—To offer extra discounts and so induce merchants to buy a particular line is a common practice, and where the goods are of the right kind it can be justified. Too often, however, the merchandise is of such a nature that it can be disposed of only by extraordinary means, in which case it is safe to assume that the merchant gains nothing from the extra discount. Such goods usually cost the retailer more in the end than those on which a lower rate of discount was offered. While retailers realize that customers pay for

premiums offered with certain articles, they often fail to see that extra inducements in the nature of extra discounts are, in reality, premiums that are held before the eye in order to obscure some uncertain qualities in the goods themselves. When this and other unscientific methods of purchasing are followed, the retailer fails to look objectively at the trade territory or market, contenting himself with superficialities and overlooking the real *raison d'être* for the goods on the shelves.

Bargains as Inducements.—The chief inducement used to divert the retailer's attention from a scientific appraisal of his market, is bargaining. Perhaps some jobbing house has gone to the wall, or has had a fire, or, for some other reason, has a stock of goods that it wants to be rid of. An alluring price is placed on the job lot and a clever salesman unloads it on some retailer who does not think clearly. It is no doubt true that some real bargains are secured in such cases, but more often the retailer is ensnared in the same mesh that he uses to attract customers to his own bargain sales.

Human nature seems to be the same, whether found in retailer or in customer; a bargain appeals strongly to each, and for the time that it is held before the eyes it seems disproportionately attractive. Of course salesmen understand the necessity of laying all the emphasis on the strongest buying motives, hence this activity is not profound in its complexity. The marvelous feature of such transactions is that the uppermost buying motive of retailers should be what it is. The prominence of the motive to "get something for nothing" must give way to others whose existence will further more precise and accurate purchasing, if retailers are to furnish a satisfactory outlet for large-scale production.

2. **Purchasing Based on Friendship.**—Friendship for the traveling salesman has been found to be the chief reason for

some retailers' purchasing certain lines of goods, although the latter were unconscious that this was true and were reluctant to admit it when apprised of the facts. When the line sold to retailers by means of friendship has coincided with the results secured from an investigation of the market as to what should be sold (quantity and quality considered), no harm has resulted; but obviously such a coincidence could exist only by accident. Friendship has usually resulted in blinding the merchant to existing conditions, for a knowledge of which have been substituted highly colored and strictly hypothetical conditions prepared and held in view by the salesman. As in the case of bargains, sales are made because of attack through a vulnerable point.

The quality of friendship is with some merchants, as with men in other occupations, a prominent characteristic, overshadowing and subordinating all others and making the possessor one-sided and incapable of unbiased judgment. To such, friendliness on the part of the salesman is of undue magnitude, and all other considerations sink into the background. Lines better qualified to meet local conditions receive no consideration, partly because of lack of friendliness on the part of the salesman representing them, but more because of loyalty to the friendly salesman representing the other lines.

It does not necessarily follow that the salesmen who ingratiate themselves with this type of merchant are entirely conscious of their own activities. Perhaps they are the "born" salesmen type who make up in friendliness what they lack in the knowledge of their goods. Whatever the source of their influence, it remains true that such friendship between merchant and salesmen is exceedingly costly to the former, as well as destructive of self-discipline to the latter. And when this friendliness stimulates a merchant to leave one jobber and go to another because a certain salesman has left the former for the latter, several cases of which have been found,

it assumes proportions that become a menace not only to the retailer but to the public as well.

3. Confining Purchases to "Standard" Goods.—Retailers often purchase goods because they are nationally advertised and considered "standard." Nationally advertised goods carry no advantage in some markets, and when the practice of confining purchases to this class of goods is followed, many important factors in the buying equation are overlooked. What is considered standard by some classes of people is not always recognized as standard by others. The supposition that all classes of people view merchandise from a certain standpoint has, as its premise, the fallacy that all persons are educated equally regarding it. Many cases are known where retailers have purchased lines advertised in standard magazines rather than to put on their shelves the goods of an obscure manufacturer, even though the latter carried with them a larger percentage of profit. Some nationally advertised goods seem to have won their place in the store simply because of their ubiquity in the magazines read by the retailer. The very persistence of these advertisements has misled the merchant, for he has assumed that those in his trading territory or market have been equally educated and impressed. Only too often this has not been the case.

Social and Economic Surveys.—From an investigation[3] of the social and economic conditions in a typical township in Iowa, it was found that only one family in fifteen was a subscriber to a standard magazine, only one in every ten took a religious paper, and only one in every three subscribed to some daily newspaper. From this it would seem that many merchants are not getting what they are paying for. In other

[3] L. B. Mounts, A Survey of the Social and Economic Conditions in a Rural Township, p. 64, Iowa City, State University of Iowa, 1917.

words, they are accepting a lower percentage of profit per article because they expect a larger volume of sales due to national advertising; when, in reality, the sales of the nationally advertised article may not be much larger, if any, than those of obscure brands, simply because the magazines in which they appear do not have a wide circulation in their market. Not having carried some obscure brand, the retailer naturally cannot know whether the advertised brand is the means of producing more sales.

It would seem that the dictates of self-interest would impress upon any merchant the necessity of acquainting himself with the extent of the national advertising in his market. A survey should be made to ascertain what per cent of the potential buying public are subscribers to the magazines in which the goods are advertised. With this information, any merchant could quickly decide whether to buy nationally advertised goods carrying a small per cent of profit, or private brands carrying a more generous margin.

Co-operative Market Analyses.—A magazine survey might be made by any individual merchant, but since the character of the magazine subscriptions in the community is a matter of interest to all merchants, it would seem that such a survey could best be planned and carried out through the organized facilities of a commercial club or community organization. Moreover, just as it is more difficult and expensive for any one individual security-holder to ascertain the true character of the property represented by his certificates than for an organization of brokers, bankers, or stockholders to obtain such knowledge, so it is more difficult and expensive for any individual merchant to attempt to find out the nature of the magazine subscriptions in the market than for an organization to collect and disseminate the data. Such a survey will repay any ordinary expense connected with securing it.

Ignorance of Market Reduces Profits.—In many cases merchants will find that they have been sacrificing profits for years by carrying certain lines, around which the salesmen or themselves have created a halo of public recognition. To ascertain what the public is willing to buy rather than to assume its attachment to certain lines because of national publicity, is a change in point of view that should mean more profit to retailers and the purchase of goods that are more acceptable to the consumer. Assume nothing, ascertain everything, is a safe policy for merchants to follow in purchasing. The market must assume greater significance than store convenience or retailer opinion.

4. Purchasing Based on Habit.—With some merchants the purchasing of certain lines of goods is nothing more or less than a habit. Some temperaments get into well-defined mental grooves more readily than others, and it is apparently as hard to get out of them as it is to break a physical habit. A habit shortens the time necessary for the performance of an act, and it is probably because of this fact that it is usually allowed to direct the purchasing of goods. Habitual tasks can be accomplished in a surprisingly short space of time but tasks that demand specific attention require a longer period for accomplishment. To make buying automatic and avoid the irksomeness incidental to continued application, seems to be the aim of some retailers. In other words, some merchants are mentally lazy and seem to become exhausted if their attention is concentrated on any problem for any length of time. Like any other laziness, this kind can be dissipated by work. Close attention to marketing problems is the only means of creating vigorous thought regarding them.

Inefficiency of Automatic Purchasing.—Needless to say, purchasing cannot be made automatic; it cannot be performed

in a habitual way. Ideas are changing too rapidly to permit stability and uniformity of quantity, quality, and style in goods. It is only in more or less routine work that habit can play any great part. Some merchants, no doubt, wish that styles and other characteristics of goods were more stable, but their hopes are no determining element in actual conditions. Only too often men of this type substitute the imaginary for the real; and then it is that habit becomes a vicious factor in business. This situation reminds the writer of a building contractor who refused to put fireplaces in his houses because he said the public was foolish to demand them. The fact remained that the public did demand fireplaces, and was willing to pay for them; and it got them, regardless of what the contractor thought.

Knowledge of Demand.—Buying is the chief problem of merchandising. The old saying, "Goods well bought are half sold," contains much truth. To buy goods of the right quantity, style, and quality, is perhaps one of the most intricate and difficult of arts and can never be reduced to routine. Neither can it be turned over to inexperienced employees, while the proprietor uncrates goods at the rear of the store. If the merchant has real merchandising ability, a large part of it will be expended in scientifically purchasing goods. Accounting matters, store arrangement, window decoration, and other important duties can be standardized and turned over to others to supervise or perform much more easily than can the function of buying. It is true that others can gather data on which the buying judgment may be based, but the important fact remains that the judgment itself must be made by the person with the greatest merchandising ability and experience, and in the smaller establishments he is usually the proprietor. The most difficult and exacting work should be done the most thoroughly and by those best qualified to perform it.

5. **Purchasing Based on Sense of Obligation.**—Some merchants purchase from certain jobbing houses because of a feeling of obligation towards them. A sense of obligation may have developed because a jobbing house stood by the merchant, or gave valuable concessions when he badly needed them, or provided some other service of importance. That the merchant owes a debt to the jobber who has extended him credit at a critical time in his existence, or who has given him any other valuable service, goes without saying. Yet this debt can be repaid at a ruinous rate. For a merchant to buy goods of a jobber because the latter has befriended him, is usually to pay a high price for that service. It would be far better for the retailer and the public if the former paid for this service at a money price considered fair by all parties connected with the transaction, than for him to feel obligated to purchase in ignorance of the demands of his market.

Anything that tends to divert the attention of the merchant from the real reason for buying, i.e., the nature of the demand, is a dangerous obstacle to successful merchandising, especially if the object of distraction is itself attractive. The enticing behavior of siren jobbing houses should not blind the retailer to the ultimate disaster that lurks near-by. The extra services that some jobbers perform are real, and of money value, but the retailer must be wary of all such attractions; he must chain himself to the steering-wheel of duty and run his business craft where his chart and compass indicate—and that is in the direction of the rapidly fluctuating and highly sensitive demand.

Basis of Efficient Method.—In the preceding sections, dealing with inefficient methods of purchasing, it has been pointed out that the purchasing of a great many retailers is defective because certain matters receive undue consideration and pre-

clude an interpretation of market tendencies and possibilities. Conversely, the basis of efficient purchasing lies in ascertaining, judging, and accumulating facts regarding the demand for goods, and formulating from these facts generalizations or principles that will serve as accurate guides in purchasing merchandise. These processes must be in continual operation, as the conditions with which they are related are in constant movement and subject to change. The buying equation includes many variables which cannot in all cases be determined accurately, but their value and significance must be estimated on the basis of known facts, which, in their turn, have been carefully gathered and evaluated. The goods finally purchased will thus represent many interrelating and highly changing factors; just as the course of any steamship is the result of many conditions, such as the velocity of the wind and the current, the humidity, and the temperature, as well as the internal conditions of the ship itself.

Even those dealers who make an effort only to estimate marketing factors, realize that the more factors they take into consideration, the less inaccurate will be their decisions as to purchasing. The difficulty is that too many retailers feel that they are equipped to estimate the conditions affecting the demand, and that analysis is unnecessary in determining their significance. What many believe to be an estimate is, in reality, only a guess; and it is little wonder that so many business superstructures collapse when their foundations are an unknown quantity. Demand is the foundation of all retail business, and its nature and extent must be known—not guessed at. Human nature is a highly changing factor in the buying equation, and consequently the greatest discrimination in gathering data, and the most unbiased judgments in weighing facts, should be used. It is with all these difficulties of the situation in mind, that the "trade survey" as a method of market analysis is presented.

The Trade Survey.—The purpose of the trade survey is to ascertain in terms of money value, a community's consuming power. This information is secured in the following manner: From the production figures at mill-cost price for any commodity in the United States, as found in the United States Census, are subtracted all exports of the same commodity, and to the difference are added all imports. The mill-cost consumption figure for this commodity thus obtained is then multiplied by the average retail mark-up,[4] and the product represents the gross sales of this commodity in the United States.

The per capita consumption of this commodity can then be found by dividing its gross sales figure by the population of the United States. The per family consumption can be found by dividing the gross sales of the commodity by one-fifth of the population, while the consumption of the commodity for every man sixteen years of age and over, can be determined by dividing the gross sales of the commodity by 35 per cent of the population.

Defining the Market Limits.—From these consumption figures for all lines of commodities, the consuming power of any community can be ascertained in terms of money value, provided the boundaries of the community can be defined. For example, if it was found that each family in the United States makes an average expenditure on groceries of $228, in order to get for any community the total consumption figures for groceries, it would still be necessary to determine how many families could be considered as economically included within that community. At first thought it might seem that this determination of a community's trading popu-

[4] The retail mark-up can be ascertained for several communities, and averages struck. Information of this character, sufficient for purposes of a trade survey, has already been collected.

lation (often known as its trade territory or market) is a purely arbitrary matter. This is far from being the case, although some writers have indicated that, on the average, every city should draw from an outside territory that embraces a population equal to 40 per cent of itself.

It is obvious that many conditions determine the extent of any city's trade territory. Geographical conditions are often very important in freeing a city from outside competition, or in handicapping it in the race for trade. Extraordinarily fair and comprehensive merchandising methods have been the means of some cities' including in their trade territory outlying districts whose population was equal to 75 per cent of that of the city. All of which indicates that each city must be considered as an individual case from the standpoint of a market.

Differentiating Overlapping Markets.—The trade territory of a city must be taken to include the population of the city and all outlying districts that are directly and naturally tributary to it. This includes outlying territory that for any reason whatever does and should trade in the nearest city. In most cases the population of these country districts will not be exactly 40 per cent of the population of the city that forms their trading center. If villages having retail stores are included in the city's market, usually some fraction (not easily determinable) must be deducted from the trade territory in order to get a fair estimate of the city's trade possibilities. The retail facilities of both city and villages will have to be taken into consideration in determining where the trade boundaries of one community end and the other begin. Of necessity communities overlap, but nevertheless they usually have boundaries that are more or less natural in character and that serve to differentiate aggregations of people with common interests.

Market for Different Commodities.—While what constitutes a city's market can be determined in the manner indicated, it is nevertheless true that the extent of that market varies with different lines of goods. For example, it has been found[5] that a city's trade territory is much larger for ladies' ready-to-wear apparel, dress goods, jewelry, books, furniture, pianos, dry-goods and for men's suits, than it is for implements, lumber, groceries, drug store sundries, and phonographs. Because of this fact, it would often be misleading to assume that a certain district should comprise a city's market for groceries because it is the city's market for ladies' ready-to-wear clothing. Accuracy in determining any city's market can come only through considering its local peculiarities.

Qualitative Market Analyses.—Not only a quantitative market analysis should be made, but likewise a qualitative. Knowing the number of stoves a community should require, does not indicate the kind of stoves it is using or the changing trend of demand. This knowledge can be secured only by constant contact with the consuming public and personal investigations of what is in use. In a hardware store in a town of 900 inhabitants an investigator discovered nothing but cheap stoves. On being asked why he did not carry some high-grade ranges, the retailer replied, "They want cheap stuff in this town." The investigator went to the telephone, called up sixteen housewives, and asked them each one question, "What kind of a stove have you in your kitchen?" Twelve out of the sixteen had a certain well-known standard brand of range. They purchased them out of town. In some towns the investigator found that women were purchasing their shoes out of town, because the styles sold in the town's

[5] Where Farmers Trade, p. 8. Topeka, Kan., The Capper Publications, 1917.

stores were not to their liking. Watching the feet of people as they walked past the stores would have been a most enlightening market analysis for the shoe dealers of that town. Sometimes a house to house questionnaire or canvass has indicated what customers wanted and what they were using. These and other plans of qualitative market analysis mean goods more to the customer's liking, fewer carry-overs, a lower marketing cost, and a more satisfactory outlet for the manufacturer's product.

CHAPTER X

MANUFACTURER MARKET ANALYSIS

Development of Manufacturer Market Analysis.—During the seller's market of the last century, manufacturers were concerned primarily with creating goods and getting them to the market. Now, during a buyer's market, manufacturers are chiefly interested in ascertaining the absorption capacity of the market. With this information, the production phase of the business can be controlled, and the distribution or sales department is enabled to act intelligently in its locality emphasis. Even though the orthodox method of distribution is followed, it is desirable for the manufacturer to have first-hand knowledge of his markets. This knowledge comprises information as to the following points in particular:

1. Where the goods are sold.
2. What classes of people purchase them.
3. The chief reasons why they are purchased.
4. The characteristics of the men who are selling the goods.
5. The conditions under which the dealers are working.
6. The nature of the dealers' sales methods.
7. The costs of sales.
8. Alternative methods of selling and their relative advantages for particular territories.

Methods of Gathering Market Data.—Market knowledge is now being secured by research departments, which are being created in increasing numbers by manufacturing concerns, groups of department stores, and wholesalers. Expert

analysts, statisticians, and investigators make up the staffs of these departments. Their work consists of analyzing the field, or market, organizing the resulting data in clear and concise form, and formulating conclusions based on these data. Previous to the creation of research departments many manufacturers made a practice of gathering market data, but the methods pursued were for the most part haphazard and desultory. Much important market information was never analyzed because it was never worked up in a form to be readily comprehended by those who could profit by it. Graphic methods of representation, by means of which the presentation of facts to managers and boards of directors has become a comparatively simple and interesting operation, have advanced market analysis considerably. These and other methods of the analyst and statistician have provided the necessary tools by means of which market facts may be utilized to determine production and sales policies. Knowledge of the market is thus truly becoming a directive force in commerce, and the modern research department forms the medium through which it is enabled to operate.

The Manufacturer's Market.—The market of the manufacturer may consist of one, two, or three parts. If the orthodox system of marketing is used, there is first, the immediate market—the wholesaler; second, the intermediate market—the retailer; and lastly, the ultimate market—the consumer. If the wholesaler is eliminated, the intermediate market becomes the immediate market; and if the manufacturer sells direct to the consumer, the latter becomes the immediate as well as the ultimate market. In a buyer's market a careful analysis of each of these classes of customers is a growing necessity. Knowledge must be had of the sales methods pursued by each market functionary as well as the buying habits of customers and the influences which affect them, since

it is only from this information that the manufacturer can determine reasons for increasing or slackening up his distribution.

To understand fully the strength and weakness of each market functionary is to be in a position to make prompt readjustments in the direction either of further differentiation or integration of market functions. Ignorance of any of his markets places the manufacturer in a dependent position as regards his distributors. Market analysis means for him independence and lower costs in the distribution of goods, because more rapid readjustments in marketing machinery can be made.

Analysis of the Wholesale Market.—It is possible that a thorough analysis of the wholesale market for each product would alter materially present channels of distribution. Some merchandise which is now being sold direct to the retailer would probably employ the wholesaler as a medium, while some merchandise being distributed through wholesalers would no doubt move direct to the retail market. An analysis of the different markets would reveal their relative advantages for goods of different types, and presumably adjust the market machinery to the goods which it must handle. The more complete the analysis, the more the questions to be answered. Methods long taken for granted would have to justify their continued existence by the efficiency with which they could operate under changing conditions. The existence of a buyer's market is hastening such an analysis, but in many lines of goods its pressure has not yet been felt sufficiently to induce manufacturers to scrutinize the character of their immediate market. The manufacturer who makes this analysis before he is forced to do so by the changing market emphasis, is the manufacturer who will lead his competitors in the race for trade under the new conditions.

A Cross-Section of the Wholesale Market.—An analysis of the wholesale market would result in securing a market cross-section which would answer for the manufacturer the following important questions:

1. How long has the wholesaler constituted our immediate market?
2. Why was he originally chosen as our immediate market?
3. Are the conditions which dictated the original adoption of this market now operating?
4. Is this market functionary satisfied with our treatment of him?
5. Is the wholesaler "sold" on the superior value of our goods as compared with similar goods?
6. Is the wholesaler's percentage of profit on our goods as great as on competing goods which he does not handle?
7. Is his percentage of profit on our goods as great as on other goods he handles?
8. Is his total profit from the sale of our goods larger than the total profit from the sale of other similar goods?
9. To what class of retailers does he sell our merchandise—good risks, bad risks; quality dealers, price dealers; retailers catering to special classes, etc?
10. What characteristics of quality, style, service, etc., pertaining to our goods, does he emphasize in selling to the retailer?
11. What competing lines does he carry?
12. As regards turnover, what position among competing lines would our product take?
13. Is our merchandise given preference over others? If it is, what reasons account for that preference? If not, what merchandise is thus favored and why?
14. Does the wholesaler appreciate our efforts to create dealer- and consumer-demand?
15. Has he any idea as to how the mediums of demand-creation could be improved in effectiveness?
16. To what extent is our advertising material utilized in selling our product?

17. To what extent is the advertising material of competitors utilized in selling their product?
18. Do competitors co-operate with the wholesaler to a greater extent in selling their goods?
19. Is the demand for our goods increasing or decreasing? Why?
20. Is the demand for our goods increasing or decreasing as rapidly as competitors' goods? Why?
21. Has the wholesaler handled our goods continuously, or has he handled them intermittently?
22. Why has the wholesaler ceased handling our goods?
23. Do his private brands compete with ours?
24. Is he interested in manufacturing his own brands?
25. Is he interested in securing his own retail outlet?
26. Does he sell direct to large institutions?
27. Has he antagonized retailers by his methods of sale?

The consideration of such questions enables the manufacturer to visualize the extent and character of the market for his merchandise. It cannot but promote more intelligent marketing, i.e., marketing through the most efficient channels.

Analysis of the Retail Market.—Whether the retail market is for him the immediate field or an intermediate one, the manufacturer does well to know its character. At the most inopportune moment economic conditions may change it from an intermediate to an immediate market, leaving the manufacturer unable to cope successfully with new responsibilities. Besides, the efficiency of the immediate market cannot be fully visualized without a comprehension of its outlet. All markets are interrelated; they cannot be satisfactorily understood when isolated and studied by themselves. Whether the wholesaler is living up to his opportunities cannot be determined without knowing the nature of his opportunities. To know the relationship between markets is to be independent of the cramping influences which often dominate the methods pursued by market functionaries. Furthermore, integration of

market functions is more easily accomplished when the interrelating markets are thoroughly understood by manufacturers. Chain stores, mail order houses, and manufacturers' agencies would never have arisen had not a diagnosis of the retail market indicated the probability of their success. More widespread and thorough analyses of the retail market may reveal further possibilities for market modification. The most delicate adjustment of marketing machinery to market functions can never be made unless market conditions and relationships are completely understood. A market analysis produces this comprehension.

A Cross-Section of the Retail Market.—On the whole, the analysis applied to the wholesale market applies also to the retail market. In addition, such knowledge of the market as is represented by answers to the following questions seems necessary:

1. What is the nature of the retailer's location?
2. Does he have modern show-windows? Are they attractive? How often does he change them?
3. Has he modern fixtures? Are they arranged to care for the trade advantageously?
4. Is the store modern in other respects, such as lighting, heating etc.?
5. Is the stock attractively displayed? Is it marked in plain figures or characters?
6. How much stock does he carry?
7. What is its turnover?
8. How much of our own stock does he carry?
9. What is its turnover?
10. How often does he take inventory? Has he a perpetual value or quantity inventory system in any department?
11. How often has he special sales for closing out stock?
12. Does he maintain manufacturers' prices, or is he a price-cutter?

13. Is he interested in working out schemes for increasing his business?

14. What percentage of profit does he consider necessary?

15. What is his cost of doing business? Is it correct?

16. What percentage of his business does he secure by mail order, telephone, solicitation?

17. Has he a delivery system? Is it adequate?

18. How many salespeople does he employ? On what basis does he pay them?

19. Do his salespeople have any opportunity for salesmanship instruction?

20. What is the nature of his competition—local, near-by cities, mail order?

21. What methods does he employ to meet competition?

22. Does he prefer to mail his orders for goods, or does he prefer to give them to our salesmen?

23. How often do salesmen representing a similar line call? How often do they show their samples?

24. How often does our salesman call? How often does he show his samples?

25. Does our salesman build up confidence for our house?

The Retailer's Attitude Toward Advertised Goods.—Besides the data secured from answers to the above questions, it has been found desirable for the advertising manufacturer to ascertain the retailer's attitude toward advertising and advertised goods. Answers to the following questions give the desired information:

1. Does the retailer subscribe to trade papers? What are they?

2. Does he read the advertisements in them? Does he stimulate his salespeople to read them?

3. Does he subscribe to general magazines? What are they?

4. Does he read the advertisements in them?

5. Are such advertisements productive of orders?

6. Does the retailer believe in advertising? What mediums does he use? Which are the most productive?

7. Is dealer-literature made use of? What is done with it?

8. Are trade-marked goods given preference?

9. Does the retailer co-operate with national advertising campaigns?

10. Does he have a store slogan? Does it represent a distinctive store feature or service?

11. Has he any conception of the marketing function of advertising and its relation to distribution costs?

With such information before him the sales manager becomes a well-informed general who knows the topography of the battlefield and the strength of the forces with which he has to contend. If success crowns his efforts, he can put his finger on the circumstances causing this result; if sales efforts result in failure, the reason therefor is as readily discovered. The retail market analysis does away with guesswork and haphazard results. In a buyer's market, such analysis is indispensable market machinery.

Analysis of the Ultimate Market.—It is for the ultimate market that all merchandise is produced, although some goods become unsalable en route through the other markets. To understand the conditions with which the retailer has to deal is no less desirable than to understand those affecting the distribution of the wholesaler. Notwithstanding the fact that both retailer and wholesaler may be used in marketing the manufacturer's goods to the consumer, these market functionaries are often unaware of market possibilities; it is rare that of their own motion they seek the complete saturation of the market. When, however, market possibilities are brought to their attention these middlemen often assume greater responsibility for intensifying distribution in their territory. In a buyer's market the pressure of potential supply

makes it imperative that market saturation be more completely realized, and this may be accomplished through increasing demand by means of market analyses on the part of manufacturers and middlemen, or by integration. As long as the middlemen recognize the necessity of co-operating with the manufacturer in ascertaining market possibilities, just so long will integrating movements be retarded; but when wholesalers and retailers are tardy in their response to the manufacturer's effort to enlarge his distribution, the forces of integration are accelerated.

A Cross-Section of the Ultimate Market.—An analysis of the ultimate market seeks to determine the extent and character of the demand. Demand must be analyzed from the standpoints of: location, consumers, climate, financial conditions, transportation, and competition. Answers to such questions as the following must be sought:

1. *Location.* Does the demand come from cities, small towns, or rural districts? Is it localized or national in scope?

2. *Consumers.* What percentage of the population is rich? Of medium circumstances? Poor? What percentage is married? Single? Old? Middle-aged? Young? What percentage consists of laborers? Agriculturists? Professional men? Business men? Mechanics? Clerks? Servants? What nationalities predominate? Are the inhabitants of the territory included thrifty? Is the population pleasure-loving or serious-minded? Do customers ask for our product by name or trade-mark? Do consumers subscribe to magazines which advertise our product?

3. *Climate.* What is the characteristic climate for each month of the year? During what seasons is rainfall heaviest? In what respects does the climate affect the buying habits of the population?

4. *Financial conditions.* What important industries are located in the territory covered? Do surrounding crop conditions affect local business? What effect do national indus-

trial influences have on local industries? What is the strength of local financial institutions? Have there been labor troubles in this territory? Are wages high or low? What is the outlook for continuous industrial activity?

5. *Transportation.* What is the nature of transportation facilities—steam roads, electric roads, water routes, trolley lines? Are these facilities adequate? Are they improving or declining in efficiency? What is the length of haul? What are the rates? Are they higher or lower than competing districts? What is the number of rural free delivery routes? Are these routes utilized?

6. *Competition.* Do customers prefer a competitive article? What are the reasons for this preference? What percentage of the per capita consumption is secured by the retailer handling our merchandise? What percentage of the per capita consumption is secured by local retailers handling competing lines? What percentage of the per capita consumption goes to near-by cities or mail order houses?[1] Do competing regions possess any vital advantages over the local district? Will these advantages increase or decrease in importance?

Analysis of Demand and Product.—If the manufacturer intends to advertise his product, an analysis of another phase of market demand is necessary, namely, a study of the reasons why people should purchase the product. These reasons or motives for buying cannot be ascertained without an analysis of the characteristics of the commodity and its ability to satisfy certain requirements.

Merchandise falls into two general classes:[2] (1) that which requires an increased expenditure of the customer's money, and (2) that which merely changes the direction of present expenditures. In the first class are two types of goods: (1) a new product which meets an existing and evident need, and (2) a new product whose lack the customer has

[1] See Chap. IX.

[2] C. D. Murphy, What Makes Men Buy? *System*, Sept., 1912.

never felt and which appears to be merely an extra and unnecessary expense. To sell the latter product throws a heavy burden on the sales organization and can be accomplished only by following methods entirely different from those used in selling the former product. In selling a product which meets an existing need—for example, cigars—it is only necessary to explain, describe, and illustrate the product, indicating that it is just what has been needed for a long time. In selling a product the need for which has never been felt—for example, a set of encyclopedias—the customer must be made to feel the disadvantage of being without it. The sales effort must be vigorous and inspiring enough to induce the customer to make an extra effort to earn or save the money required for the unexpected outlay on an article of uncertain need. Failure properly to analyze the product would probably result in confusion of appeals and loss of distribution.

In the second class, made up of familiar goods, are also two types: (1) familiar goods offered in a distinctive manner, and (2) familiar goods offered in the usual manner. With goods of these two types the problem is to change the customer's habit of buying some other brand. Not merely must the brand be suggested, but "reasons why" must be advanced to produce a motive for changing the buying habit. When the housewife decides to purchase a new brand of chocolate, flour, or canned goods, it is almost invariably because genuine reasons have been advanced which have induced her to do so. An analysis of the goods reveals the motives for buying them, and the appeals in advertising and selling which must be used in order to give them successful distribution.

Another Scheme of Commodity Analysis.—The sales manager of a large corporation[8] has divided the analysis of a

[8] R. E. Fowler, *Printers' Ink*, Feb. 18, 1912.

commodity into six classifications: demand, serviceability, quality, price, profit, competition. The study may be outlined as follows:

1. Demand is developed or undeveloped, forced or natural, permanent or seasonable.

2. Serviceability is determined by answers to the following questions: Is the article a necessity? Is it a luxury? Is it a convenience? Is it durable? Is it economical in use?

3. Quality may apply to raw materials, design, workmanship, appearance, and finish. How does the article in question compare with competing articles in these points?

4. Price applies to the jobber, broker, retailer, and consumer. Is the price high, medium, or low? How does it compare with the prices of competing articles?

5. Profit also applies to the jobber, broker, retailer and consumer. Is it larger, equal to, or smaller than on competing lines?

6. Competition is officered by old men or young men, men who are aggressive or lax. Is the competition recent, or long-established? Is it from concerns that are wealthy, or of limited means? What are their sales plans, their advertising campaigns, their policies toward customers? What characterizes their sales managers, their sales force, their credit department's attitude toward customers?

Commodity Analysis and Market Possibilities.—Just as market analysis determines the possibilities for the sale of commodities, so commodity analysis determines to what extent these possibilities are real so far as any particular article is concerned. As the commodity cannot exist apart from the market, neither can the market be considered as distinct from the commodity. Both are part of the same thing—satisfactions. In analyzing commodities, a search is instituted for qualities which correspond to demand, active or latent. If these qualities are discovered, a demand or market for the goods exists—wealth has been created; if no qualities can

be found which thus correspond to active or latent demand, or if such qualities are present only to a slight degree, no demand or market for the goods exists—no wealth has been created (or a less degree of wealth than was anticipated by the manufacturer).

Thus it is seen that wealth or value does not exist unless it exists in the minds of people; unless, that is to say, there is a demand. Creation of goods, therefore, is not necessarily creation of wealth. The latter is obtained only when a market, or demand, is assured for the goods. A market requires buyers as well as sellers; it requires demand as well as supply. If the supply exists but not the demand, the demand must be created; just as when the demand exists but not the supply, the supply must be created. Satisfactions, utilities, wealth, or value cannot exist excepting as counterparts of each other in the minds of buyers and sellers; that is to say, they cannot exist excepting in a market. When this conception of the market is fully realized, more attention will be given to creating markets by analyzing commodities for points of contact, rather than in the mere making of market surveys which often accept values as they exist at the time and not as they may be created. In a very real sense the market is in the goods themselves. Whether or not this market is discovered, depends on the thoroughness of commodity analysis. It must discover satisfactions which correspond to desires that are in consumers' minds.

Advertising and salesmanship are merely vehicles for connecting up these "counterparts of satisfactions." If they are discovered in both commodity and consumer, and properly connected up, the commodity is sold. If the counterparts of satisfactions are not discovered, they cannot be connected up; or if they are discovered but not properly connected up, the sale is lost. Marketing deals with the discovery of the counterparts of satisfactions, and with the market functionaries

whose business it is to make connections between them. It is not to be forgotten that selling is only one phase of making this connection. Sorting, grading, classifying, risk-taking, transportation, financing, etc., are likewise necessary in connecting the counterparts of satisfactions. It might be said that often the selling function merely appears to be the most important because it appears last in the series. Yet in a very real sense the importance of selling overshadows that of the other functions, because no matter how well they have been performed, they have been performed for naught if the goods are not sold. Hence the present-day stress upon advertising and salesmanship.

Counterparts of Satisfactions in Commodities.—Manufacturers are beginning to recognize as never before the possibility of finding the counterparts of satisfactions in commodities. Laboratories are being created and scientific analysts are being employed in the effort to ascertain existing but invisible satisfactions. Cooking-fats, textiles, safety-razors, hammers,[4] tooth-paste, automobiles, office equipment, and hundreds of other articles are undergoing an analysis which a few years ago would have seemed misplaced. But all this is necessary in a buyer's market. Goods are seeking the market. They must be able to show counterparts of satisfactions before they are marketable.

If the article itself has no more counterparts of satisfaction than competing articles, then its container, by means of its label, color, shape, or other device, must provide counterparts of satisfaction which do not exist in competing articles. Hence commercial analysis is not confining itself to the commodity itself, but considers also the appearance of the commodity when it enters the market. Reference has

[4] P. W. Ivey, Elements of Retail Salesmanship, pp. 39-40, New York, The Macmillan Co., 1920.

already been made to the analyses which are being made of the store surroundings when the commodity makes its appearance on the market, and also the character of the service connected with its distribution. Both service-satisfaction and surroundings-satisfactions have their counterpart in the demand, and in reality become a part of the commodity in the customer's mind. Yet these latter analyses should not be confused with pure commodity analyses which seek to discover value or satisfactions which would otherwise remain obscure.

Counterparts of Satisfactions in Consumers.—The counterparts of satisfactions in consumers are known as buying motives or instincts. To study the extent and nature of these feelings, laboratories are being developed under the care of psychologists who understand the make-up of human beings and the sources of human action. Such investigators are determining more and more clearly the kind of advertising and selling appeals that are most suitable for connecting up the counterparts of satisfactions in consumers and merchandise. Laboratory tests of advertisements and sales talks are made with the intent of ascertaining what satisfactions the seller is attempting to emphasize—that is to say, what buying motives he is seeking to influence—and whether the counterparts of these satisfactions exist in the consumer in sufficient force to make an attempted connection worth while. If a satisfactory judgment cannot be arrived at beforehand, the advertisement is run or the sales talk is used, and the results of each are carefully tabulated and analyzed. From masses of such data it has become possible to predict with surprising accuracy the probabilities inherent in sales appeals of connecting counterparts of satisfactions.[5]

---

Kinds of Markets.—While every advertising manufacturer desires a market for his goods the methods pursued in his sales appeals will depend on the exact kind of market he wishes to create. His sales appeals may operate from several different standpoints: reputation, uses, distribution, consumption, sales maintenance, trade-mark, education. Whichever of these markets it is most desirable to create, the selling plan can be worked out accordingly. Some definite kind of market should be the aim of all sales appeals, as only in this way can definite results be secured. At different times in an organization's history different markets will become necessary, and to recognize this need for change and make provision for meeting it is one of the manufacturer's marketing problems.

The ultimate, or consumer market may then be split up into several different kinds of immediate markets, the character of which will be determined by the nature of the sales appeal employed by the sales force, the advertising copy, or a combination of both. Some of the different kinds of immediate markets a manufacturer may desire to create are taken up in the following paragraphs.

A Reputation Market.—While the ultimate purpose of all sales appeals is to create a sales market or a sales maintenance market, the immediate purpose may be merely to create a reputation market. Harmonious relations with the public may often be maintained by analyzing the manufacturing and selling organization, and building up in the minds of consumers a vivid picture of this organization. Confidence being the basis of all successful business relations, a market for public confidence may be the chief preliminary requirement of a sales market. Public utility concerns in recent years have attempted through advertising to create such a market for their organizations, although they already had a monopoly

market for their commodity. They have created good-will for their organizations and secured much public sympathy. Recent advertising by the big packers has had as its aim the creation of a similar market. A bid is made for consumer-confidence in the methods and practices employed by these organizations, as opposed to the ill will stimulated by hostile critics. The creation of a reputation market is becoming of increasing importance as integration continues in the development of large-scale producers and distributors. In such cases, a sales market is entirely dependent in the long run on the thorough development of a reputation market. Which market will be emphasized at any one time depends on conditions of market emphasis.

A "New Use" Market.—When the ultimate market for the usual method of consuming an article is saturated, it may be possible to secure from commodity analysis new uses to which the article may be put, thereby resulting in new lines of consumption and a new sales market. This has become one of the most important developments in the creation of markets. The commercial research bureau has been a large factor in this development through repeated analyses of merchandise and its functions, and through keen appreciation of the possibilities thereby discovered. The advertising man has supplemented the research bureau through his understanding of the buying motives of consumers, which enables him to make an intelligent connection of the counterparts of satisfactions. Close contact with users of the product has also helped to solve the problem of a saturated market. The owner and user of a certain machine, when asked by the manufacturer to tell about its effectiveness, wrote a letter disclosing a secret worth several thousand dollars to the manufacturer—a new and formerly undreamed of function could be performed by reason of a slight alteration. There is little doubt

but that many new uses of almost any article could be ascertained by systematic study of what consumers do with it.

A Sales Maintenance Market.—The ultimate purpose of a sales policy may be to create a sales maintenance market, that is to say, a market in which repeat orders can be safely counted on. If the article is one that is purchased often, while sales may be increasing, this increase may be offset to a large extent by failure to repurchase on the part of old customers. Repeat orders represent a different market from first orders. The sales appeal must be different in each case. The repeat market—a sales maintenance market—may be developed by showing the advantages of continuous use of the product and the circumstances in which it functions most effectively. For example, a certain automobile polish was purchased in quart bottles by automobile owners who felt that they could not afford a new car or a new coat of paint. The sales appeal discovered a market for this product and was successful in selling it. However, the mortality rate of old customers was great although new customers were constantly being found. Not until an effort was made to show the correct manner of application and the advantages of continued use, was a sales maintenance market created.

A Trade-Mark Market.—The immediate purpose of the exploitation of a trade-mark may be to create a distinct market for the trade-mark itself. Perhaps the trade-mark needs individualizing; possibly emphasis needs to be placed on pronunciation or on some similar feature. Many trade-marks were created before the present buyer's market developed, hence they have quite frequently proved themselves inadequate from the standpoints of recognizability, memory retention, and identification. In order to remedy these defects the attempt is made to create a trade-mark market by means of

publicity. It should not be supposed that an attempt to create a market of this nature is developed independently of the creation of the sales market or the sales maintenance market. Often the different kinds of ultimate, or consumer markets are developed simultaneously by co-ordinated sales appeals, but even in this case, specific market analyses have to be made if the marketing of the product is to proceed logically and in the direction of complete market saturation.

An Educated Market.—It may be that a product cannot be completely distributed until the potential buying public has been educated along certain general lines which are no more intimately connected with this particular product than with the product of a competitor, or with some competing article. For example, a manufacturer of vacuum cleaners may stimulate people towards greater cleanliness and as a consequence sell more of his vacuum cleaners, but likewise increase the market of his competitors and perhaps of competing cleaners, such as brooms. This incidental disadvantage of such a campaign, however, may be far outweighed in the long run. Producing an educated market for one's goods may develop a consistent demand which will materially reduce the high operating expense caused by wide fluctuations between slack and peak distribution. Stability is given to the productive and distributing phases of any business when an educated market is created beforehand.

Summary.—It is thus seen that the manufacturer must carefully analyze the channels of marketing, whether they lead through the jobber and retailer to the consumer, or whether a more direct route is followed. Each middleman market discloses through analysis greater possibilities for more economical distribution of goods, while the consumer market is a complex of markets which depend on the nature

of the merchandise and the policy the manufacturer wishes to pursue. A systematic study of markets can be made only by specialists who are familiar with market phenomena and who know how to evaluate the multitudinous influences which have a bearing on the conclusions to be drawn. The intensive study of markets here outlined is necessitated by the development of a buyer's market, which makes it imperative that manufacturers know the extent to which various distributive methods will influence capacity production. It is only capacity production that can make possible the lowering of costs and the lowering of prices, with the consequent well-being for the community. Methods of production determine in the long run methods of distribution, although over a short period of time the latter may seem to dominate. The shifting relationship between production and distribution from time to time necessitates a change in different marketing machinery, and present methods of market analysis are parts of the new distribution machinery necessitated by present conditions.

CHAPTER XI

THE RÔLE OF ADVERTISING IN A BUYER'S MARKET

Comparative Efficiency of Advertising and Salesmanship.—Much has been said against the waste involved in advertising, with the attendant implication that a better quality of salesmanship would be less expensive and more efficient in selling goods. Whether one or the other should be used, in any particular case, for the marketing of goods, depends upon one consideration, viz., which will distribute the largest amount of goods with the least expense? Frequently from 100 advertisements of a commodity, only one sale results. Under such circumstances, advertising might be rated as 1 per cent efficient. If, on the other hand, a salesman had attempted to market the same product, he could perhaps have sold two orders out of three solicitations. In this case he would be considered 66⅔ per cent efficient. In other words, in the case where the product was marketed through the means of advertising there was a waste of 99 per cent, but if the product had been marketed by a salesman there would have been a waste of only 33⅓ per cent.

Such figures, however, have no significance when taken by themselves. The cost per unit of marketing a product may be less when advertising that is 99 per cent wasteful is used than when salesmanship under conditions of only 33⅓ per cent waste is relied upon. Competition dictates the use of the most economical method in marketing commodities, and very often where there is the most apparent waste and lost motion, the least cost per unit exists. Where goods can

be marketed most cheaply by means of advertising, even though of low efficiency, the problem is not one of substituting salesmanship for advertising, but one of increasing the efficiency of the advertising.

Relation of Advertising to Salesmanship.—Advertising should be viewed as a machine method of marketing goods, while salesmanship should be looked upon as a hand method. To sell certain goods, necessitates the personal touch of salesmanship; for selling others, an impersonal force, such as advertising, may be sufficient. The machine, or advertising, method excels in quantity distribution; while the hand, or salesmanship, method has the advantage in quality distribution. In other words, advertising markets goods in a wholesale way, whereas salesmanship markets them by retail methods. As long as goods are different in their nature, both methods of marketing are necessary and desirable.

Sometimes it is advisable at different periods of distribution to use both marketing methods on one product. For example, when typewriters first appeared on the market it was necessary to educate the people to their use by personal salesmanship. After the typewriter became an article of everyday use, advertising was resorted to more generally as a sales medium. The same has been true of aluminum cooking utensils, calculating machines, automobiles, and some other commodities. Advertising, however, is coming to be used more frequently as a missionary force. In so far as it can be substituted for salesmanship, it will eventually cut down the total cost of distribution.

Advertising not only follows salesmanship in distributing some commodities, but it may also precede salesmanship for the purpose of preparing the way for the salesman and minimizing work. Articles sold in retail stores are commonly advertised for this purpose. The customer is given

an idea of the nature of the product before going into the store, thus making necessary less salesmanship effort. Nationally advertised commodities invariably carry a lower margin of profit to the retailer because of this recognized lower expense of selling. In a very real sense they are partially sold before the customer comes into the store.

It is thus seen that advertising may precede, follow, or co-operate with salesmanship in marketing goods, or it may be used exclusively, or be excluded entirely. For certain kinds of goods and under certain circumstances both marketing methods have their advantages. For the most part they must be looked upon as co-operating rather than as competing distributing agencies. One can never entirely displace the other for they are fundamentally related. The most efficient system of distribution demands that commodities be delivered to the consumer at the least cost, hence advertising and salesmanship should be combined so as to accomplish this end.

Effect of Advertising on Competition.—Advertising stimulates competition. When a manufacturer decides to advertise, he exposes his product to attack. From the safe seclusion of verbal assertions and claims, the commodity is led out before competitors' gaze and exposed to scrutiny by means of written assertions, which may be subjected to analysis, neutralized, and refuted. Private claims, made by the salesman to the customer, may profoundly influence the actions of the latter, but whether or not such statements are true can only be determined by the counter claims of competitors, salesmen or by experience. Often the customer is influenced to purchase before salesmen from competing houses have a chance to point out possible defects in the commodity. Where advertising is used, however, one business can see the efforts of the other to get trade, and can accordingly present its rival claims in an effort to attract the consumer's sympathy. Com-

petition thrives best where the respective claims made for merchandise are known by all.

Advertising likewise places competition on a higher level. Without advertising, the attacks of competitors on each other's goods are usually haphazard, malicious, and not founded on fact. On the other hand, a salesman is less likely to condemn a competitor's goods if he knows something about them. Advertising brings merchandise out of the darkness of ignorance and suspicion into the light of fact and reason. Claims may, as a result, be based on the relative merits rather than on the relative demerits of competitive goods. With advertising as a background, salesmanship attains a new dignity, since published assertions can be utilized instead of meaningless superlatives and generalizations.

The customer profits materially from the increased competition caused by advertising and its elevation to a higher plane, for he is given an opportunity to compare the relative merits of competitor's goods, and to judge impartially as to their values. The conclusions reached from this weighing process come much nearer the truth than any judgment formed without the influence of publicity.

Advertising as a Creator of Value.—It is a common error to believe that value is inherent in an article. Value does not reside in merchandise, but in the mind of the customer. In other words, it is a mental concept. The function of advertising is to create value, i.e., to build up in the mind of the reader a high regard for the goods. To accomplish this end expeditiously, every characteristic of the goods must be known, as well as their relationships to closely related facts. Such a process necessitates digging up facts. It also means the co-ordinating of facts. Both of these operations are creating the goods in just as real a sense as did the workmen and machinery which originally fashioned them.

The extent to which the advertisability of the article can be developed depends upon the ingeniousness of the advertiser. The Beech-Nut products are made more valuable in the consumer's eyes by attractive description of the plant atmosphere in which they are produced. The flood of bright light; the immaculate rooms; the well-groomed, cheerful, manicured employees; the sense-satisfying odor of the ingredients; the inviting restrooms for employees; the benevolent management; and many other conditions surrounding the manufacture of these products are made part of the products by the advertising appeal, and increase their value to the consumer.

Distinguishing Similar Products.—It is very often difficult to find an element of value in a commodity that a competing article does not possess. Yet unless some distinguishing characteristic is found, the commodity is lost in the dull uniformity of other competing brands. In some cases where the product apparently has no distinguishing element of value, the clever advertiser has created one. Colgate's tooth-paste illustrates the point. With many tooth-pastes of similar quality and effectiveness on the market, it was necessary to create some feature which would give it a personality all its own, and thus an added value. The distinguishing point that was developed pictured the paste coming out of the tube like a ribbon and lying flat on the brush. This was an obvious advantage over tubes that were not so constructed, and illustrates the creation of a value as regards the use or application of the product, rather than a value inherent in the product.

Another illustration of the same point is that of Log Cabin syrup. A unique can, shaped like a log cabin, creates a distinguishing characteristic which adds value to the product. Furthermore, the log cabin suggests the freshness of the forest, the dripping of the sap, the boiling, the sweet odors from the kettle, the genuineness and purity. The syrup thus

takes on characteristics suggested by the can. Value in the product is thereby created just as truly as when it was manufactured. There is no intrinsic value in this or any other syrup; the value the customer does not see, for him does not exist.

Advertising thus continues creating value where the value-creating manufacturing process leaves off. The advertised value supplements the manufactured value, and often the latter would be largely lost if it were not for the former. Advertising, therefore, preserves value as well as creates it. When the product leaves the factory it is only partially created —only a small fraction of its potential value attaches to it. Advertising must bring out the balance of value, not merely to make the customer buy, but also to preserve what value has already been created in the commodity in the factory.

Effect of Advertising on Unadvertised Goods.—Advertising articles of a certain class tends to increase the sales of unadvertised articles of the same class. Thus, the advertising of one brand of vacuum cleaner tends to sell more of other brands. People become sold on the idea of a vacuum cleaner through advertising, without becoming unalterably opposed to purchasing a brand other than that advertised. The sale of the idea of this method of cleaning is therefore valuable to every manufacturer who is contemplating placing vacuum cleaners on the market.

A more interesting fact is that advertising articles of a certain class tends to increase the sales of unadvertised articles of another class performing a similar function. Thus, the advertising of vacuum cleaners increases the sales of brooms. This illustration goes back a step further than the example cited in the preceding paragraph. Selling the idea of vacuum cleaners is primarily selling the idea of cleanliness, and sweeping with brooms is one way of securing this desirable end. In

advertising any product, it is often necessary to impress the reader with a fundamental idea which is applicable to competing articles of the same class, or of another class performing similar functions. Advertising thus unavoidably affects the sale of products unadvertised, and creates value for objects with which the advertised commodity is only distantly connected.

Advertising as a Demand Control.—Overproduction and underproduction have usually occurred because the manufacturer was, (1) unaware of the tendency of the demand, or, (2) if aware of the tendency of demand, he was powerless in many cases to exert any control over it. Demand as a rule does not just "grow"; it is the result of cultivation—of intensive effort, making use of specialized devices, such as salesmanship, advertising, and reputation. When demand can be created for the output of the factory, both ends of the productive process may be co-ordinated. There are times, however, when factory output, not demand, is the limiting factor in the productive process. At these times of underproduction, the amount of advertising is reduced and demand falls off. An illustration of underproduction for a demand which might be created, is that of the Rubberset products. Little or no new demand is being created because the present demand absorbs all the products that can be made. An increase in the advertising appropriation of this company would swamp their plant with orders which could not be filled. Such a creation of demand would not only be a waste but worst of all a loss of good-will. To preserve present value, advertising is being used scantily for a time. With increased producing facilities in the future, it may again become possible to manufacture demand as well as goods.

Advertising thus prevents waste by avoiding overproduction and underproduction in factories. It promotes factory

efficiency by enabling each individual plant to operate in that stage which is the most effective. Many plants have unused utilities within themselves, which, if used, would reduce the per unit cost of production. In other words, they are capable, with increased production, of getting into the decreasing cost stage. On the other hand, it may be just as desirable to curtail demand so that the costs per unit of product will not rise unduly in comparison with the costs of competitors.

Relation of Advertising to Traditional Marketing Method. —The traditional method of marketing is from manufacturer to jobber, from jobber to retailer, from retailer to consumer. Recent schemes have attempted to eliminate either or both of these middlemen. Obviously, where a link in the marketing process is removed, more pressure is brought to bear on the other links. In other words, while a middleman may be eliminated, his functions or duties cannot be. Such being the case, advertising has been introduced in order to take over some of the duties formerly carried by the eliminated marketing unit. One of these important duties is to find a market for the goods. Another is to stabilize the market after it has been secured. It has been a well-recognized function of advertising, to relieve some of the overworked remaining middlemen.

Can advertising, however, be used economically in the traditional system of marketing where no middlemen have been eliminated? If so, how will it be used, and where will a saving be effected? Advertising is looked upon suspiciously in the traditional system because it is believed that it results in adding more expense to the distribution cost. Such a result does not necessarily follow. Even with the jobber included in the distribution system, the manufacturer's advertising may cut down the total costs of marketing, and in so far as it does, it is entirely justified.

This reduced expense may first appear as a result of the attitude taken by the jobber toward the manufacturer who advertises. If the jobber is assured that there will be a large and steady demand for the manufacturer's goods, he will be much more inclined to push them, thus increasing the outlet for the manufacturer. Enlarging the outlet for the manufacturer's merchandise may reduce his overhead expense per unit of product, and under competitive conditions, he will be inclined to share part of this reduction with the consumer. Advertising in such cases reduces the marketing expense, and finally the price of the goods.

Advertising reduces also the expense of retailing, as shown by the fact that the retailer gets a less margin of profit on the advertised articles. Moreover, the retailer is stimulated, by the consumer-demand created by the advertising, to specialize on merchandise with a quick turnover, thus eliminating costs which usually accrue because of dead stock. This saving under competitive conditions, will, in the long run, be shared with the consumer.

Trade-Names.—A manufacturer who expects his advertising to function freely and efficiently, must consider a great many factors. One important consideration is an adequate name for his product. Many commodities have suffered in competitive advertising because they have been hastily and inadequately christened. Where articles are not to be marketed by means of advertising, it is not so important to give them at the start an adequate name, because the name can be changed later with little loss of good-will; but where the name is to be carried into nearly every home in the distribution territory, a change in name is a matter of serious consequence.

The first prerequisite of an adequate name is that it should be distinctive. There are dozens of Ohio, Standard, Union, and National brands on the market. It is too much to expect

that advertising can successfully market commodities which are thus handicapped at the start. The consumer becomes bewildered upon seeing so many products with the same name, and its lack of distinctiveness permits much substitution and general confusion for which advertising is not to blame, and for which it cannot offer a remedy. If the name of a commodity does not stand out, it is defective as a marketing device, and advertising can only heighten the defect, for it is possible to advertise a defect as well as a virtue.

The second prerequisite is that the name of a product should be easy to pronounce. "Prophylactic," "Glycothymolin," and similar names have never sold an article; the goods so named have been sold on their merit and in spite of their names. "Bon Ami" is daily being pronounced in six different ways, and the employees in the factory where it is made use all six different pronunciations. Foreign words or phrases are especially undesirable, because such a small percentage of the people know the meaning back of the words. A word which cannot be quickly and easily pronounced is not the one to designate a product which is to be marketed by advertising. Customers do not like to be corrected by the salesperson, and many cases have been known where some other brand has been asked for simply because the customer did not desire to take any risk of humiliation.

The third prerequisite is that the name be easy to remember. It is of little consequence to have one's attention attracted by a name, or to be able to pronounce it, if it is not readily remembered when the object is thought of. The advertising may be of the best, but its efficiency as a marketing force is materially reduced if the name is not built on psychological principles. An inefficient name is a leak in the business as much as a loss through theft. Only too often advertising is blamed for failure to get distribution for a commodity, when in reality the fault lies with the conditions against which

the advertising has to work. Not only must the product have merit and the advertising be good, but the name of the product must be such as to become associated in the minds of customers with the object it stands for.

Other Factors of Advertising Efficiency.—The package must likewise be looked upon as an important marketing device. It should be so distinctive that it attracts attention and is easily recalled. If possible, its shape, color, or general appearance should suggest the product itself, and in this way, be an active selling agent. The advertising of a product enclosed in a package which suggests the product is always more efficient than is the case if little or no attention is given to the package as a marketing device.

The price must be within the means of the class of people who are expected to purchase the advertised product. A price that is too high, as well as a price that is too low, places advertising at a disadvantage. A large number of the class that should be appealed to are excluded from considering seriously the product if its price does not conform with their concepts of value. Like the package and the name, the price is a marketing device which is potentially a help or a hindrance to the efficient distribution of goods. It may be that at first the price must be placed below cost, with the expectation that an increasing demand will reduce the costs per unit of product and enable not only the costs to be secured out of the selling price, but likewise a legitimate profit. The whole marketing situation must be analyzed if there is to be no undue handicap placed on advertising.

Another important factor is the geographical area of distribution to be secured for the product. Many a manufacturer has effectually closed the door of advertising to himself by securing too wide a distribution for his product at the start. If the consumption of a product is widely scattered over the

country, it is impossible for advertising to further its distribution economically. The costs of undertaking an advertising campaign which would cover the entire country would be too great for the returns secured. The product would have to be left to its fate, without any aid from the outside. Where the market, such as a state or a country, is intensively cultivated through jobbers and retailers, however, a most effective and efficient advertising campaign can be inaugurated, which may be capable of maintaining or increasing the distribution at a lower cost than could be done by other marketing forces. This is true because of the possibility of using only the mediums which cover the territory.

Relation of Demand to Distribution.—A controversy has raged in some quarters as to whether demand should precede distribution or vice versa. The answer to the question is that they should both proceed simultaneously. To build up demand through advertising before distribution has been provided through the jobber and the retailer, is to lose much of the initial force of advertising; while to develop distribution through the middlemen before consumer-demand has been stimulated, is to lose the confidence of the retailer and jobber because of the slow-turning products which they have accumulated.

This does not mean that advertisements should not be run before the products are placed in the channels of distribution. It merely means that demand should not be created without ability to satisfy it readily. Possibly advertising may need time to develop a satisfactory demand, in which case its actual appearance must obviously precede the introduction of the goods. On the other hand, it may take longer to effect an adequate distribution of the goods than it does to create a demand sufficient to absorb the supply. The whole point to the matter is that when a demand exists a distribution should

likewise exist. They are part of each other and cannot exist efficiently without each other.

Much waste in marketing occurs because these two factors are not correlated. An article is advertised as being "found at your grocer's." On going to the grocer's, he expresses ignorance of the product, but suggests that he has something "just as good." Perhaps the advertisement may have said that if the article was not to be found at the local grocery, it could be obtained by sending the retail price in postage stamps to the company's office. Only one out of a hundred people who have been taught by the advertisement to demand the article will go to this trouble, and soon the matter is forgotten and a substitute article comes into use. All such wastes are ultimately paid for by society, and, therefore, it is to the interest of consumers in general to co-operate with present-day marketing agencies in eliminating all such inefficiencies.

Selling the Retailer and Jobber.—Many advertising campaigns have a large element of waste in them because they rely primarily on selling their idea to the consumer, and overlook the retailer. Experience has proved that very few products can be so effectively portrayed before the eyes of consumers that substitution cannot be accomplished by the retailer. The latter is personally in touch with the customer and can belittle a competing advertised product without fear of rebuttal. Salesmanship has an advantage over advertising which the latter must recognize. When the pressing of this advantage is stimulated by the efforts of the jobber who is offering a private brand with a larger margin of profit to himself and the retailer, the advertising manufacturer may well consider the necessity of selling the idea of his product to the retailer and jobber at the same time that he is selling it to the consumer.

Because advertising manufacturers are recognizing this

necessity, they are sending out traveling salesmen whose purpose is not so much to sell the goods as to sell the idea of the goods. The retailer must have confidence in the merchandise and desire to handle it, even though it carries a lower margin of profit than some obscure brands that he might be able to get to fill the same demand. The consumer-demand cannot force the retailer to stock his shelves; he must voluntarily do that on the basis of a belief in the goods and in his ability to make a profit from them. The jobber must likewise be induced, not coerced, to push the advertised goods. The jobber has always found methods of side-stepping coercion. His loyalty to the manufacturer must have a material as well as a sentimental basis.

CHAPTER XII

THE INCIDENCE OF ADVERTISING COSTS

Lack of Scientific Analyses of Subject.—The incidence of advertising costs has from time to time been given some space in trade papers and has been discussed by advertising men at their conferences. Despite these activities, little of a scientific nature has been brought out concerning it. Contradictory opinions and statements regarding the ultimate location of advertising costs have tended only to confuse the situation. Hart, Schaffner and Marx tell their dealers that they are able to keep their prices down because of the large distribution that results from advertising, while on the other hand, a small competitor of this house tells its trade that it can undersell Hart, Schaffner and Marx because it does not have to burden the prices of its men's ready-to-wear apparel with advertising costs. Moreover, that a great many people believe the consumer always pays for advertising can be verified by questioning those about us. As to what they mean by saying that "the consumer pays for advertising," it is not always apparent to themselves or to others.

The Two Implications of Incidence.—In view of what has been said, it is necessary in attacking this problem to ask what is meant by the question, "Does the consumer pay the costs of advertising?" This question may have either of two meanings: (1) whether or not consumers taken collectively pay for all the expenses of advertising viewed in the aggregate, and (2) whether or not the consumer of a certain article always pays for the expense of advertising that article.

In discussing what is involved by the first meaning, very little time need be spent. It is obvious that all the expenses of distribution, which include advertising expense, in the United States, or in any state, town, or store, must be met by the aggregate income of the unit considered. To say, from this viewpoint, that the consumer bears the costs of advertising, is merely to state a truism. All persons are consumers, and taken collectively, must meet all the expenses of distribution. It seems quite certain, therefore, that this meaning is not the one usually attached to the question under consideration.

The usual meaning then of the question, "Does the consumer pay the cost of advertising?" is, "Does the consumer pay for the advertising on the article he buys?" An adequate answer will necessitate a brief consideration of price fixation under five different conditions of distribution:

1. Constant cost
2. Increasing cost
3. Decreasing cost
4. Fixed supply
5. Joint cost

These conditions of distribution may prevail in industries as a whole, at any given time, or in individual manufacturing establishments at different periods of their activity.

1. Distribution Under Constant Costs

Definition of Constant-Cost Goods.—Constant-cost goods may be defined as goods of which the cost of distribution per unit remains constant between certain limits of increased or decreased distribution. Many manufactured products reach the ultimate consumer under these conditions. For example, a certain patent safety pin can be distributed at the same cost per pin whether 500,000 or 1,000,000 safety pins

are distributed. If there were a demand for more than 1,000,000, there might be a slight increase in cost, but this new cost figure would remain constant between limits of distribution, let us say, 1,000,000 and 1,500,000. Similar conditions to these hold true for a large number of sales organizations.

Cost is the main determinant of the price of a constant-cost article—the demand for the article being assured—and the question whether the consumer of such an article pays for the advertising of that article resolves itself into this: Does the advertising appropriation increase the distributing cost per unit of a constant-cost article? The answer must of course be in the affirmative, since no matter how extensive a distribution of the article is effected through advertising, the distributing cost per unit increases to the extent of the advertising costs; and since the costs of distribution are higher than before the advertising appropriation was made, the selling price must be correspondingly higher. Whenever the consumer is unwilling to pay this higher price, the article is withdrawn from the market, distribution is cut down, and production eventually stops. This ability to withdraw the supply from the market is, of course, the vital factor in upholding the price level. Under competitive conditions it cannot always be effected so promptly as under monopolistic control, but even in the former case it is no doubt true that industry, often quite promptly, readjusts itself and produces that which is demanded at a price which will cover all costs.

Non-Advertising Competitors.—The above situation assumes that competitors working under constant-cost conditions, are all advertising in order to increase their distribution. The opposite situation might, however, be true. Some competitors may have lower distribution costs because they are not advertising, and because of the resulting lower selling

prices, may put the advertising firms out of business or make them reduce their advertising expenses; especially if the demand can be supplied by the productive capacities of the non-advertisers. But with increased demand, the constant-cost manufacturers who are advertising may be compelled to supply a very important part of the demand. They can then increase their distribution by advertising and shift their advertising expenses to the consumer by raising selling prices.

Other manufacturers working under these cost conditions, who are not advertising and whose distribution costs are therefore not as high as the distribution costs of the manufacturers who are advertising, will nevertheless raise their selling price to the level of the manufacturers with the greatest distribution costs, and in this way make an extra profit. Here would be a case where not only the price of the article has risen to the extent of the advertising costs incurred by a few manufacturers, but also where a large sum, not attributable to advertising costs, is secured from the consumers of these articles by manufacturers who are not advertising. Hence, the consumers, taken collectively, pay more than the total costs of advertising, as well as the total of old costs; while the consumer, taken individually, pays only the old distribution costs plus the advertising costs.

Incidence under Excessive Competition.—If the increase in demand appears to be of a permanent nature, the entrance into the market of new manufacturers becomes a certainty. Whether or not these new manufacturers advertise depends upon a great many circumstances, but chiefly upon the intensity of the demand relative to the supply of this kind of goods. If the new manufacturers are more numerous than the demand warrants, each of them will endeavor to control the market. Advertising will probably be one of the means to this end, and the immediately resulting price will most likely

not be high enough to include all advertising costs. Therefore, manufacturers of advertised constant-cost goods must either lose money for a time, with the hope of driving weaker competitors from the market, or they must cut down their advertising appropriations.

In either case, the consumer does not pay the costs of advertising. As the stronger organizations, however, force the weaker out of business by lowering prices below distribution cost, they are able to raise their selling price to cover all distribution costs, including advertising. Large organizations, while enjoying no immediate reduction in unit distribution costs through advertising, nevertheless continue to advertise in order to hold the market against all newcomers. They hold the market in the hope, also, that large-scale distribution will ultimately permit distribution under decreasing cost conditions, and thus lay a permanent basis for larger profits.

2. Distribution Under Increasing Costs

Definition of Increasing-Cost Goods.—The second condition of distribution under which some sales organizations of factories work is that of increasing costs. By saying that goods are being distributed under increasing costs, we mean that costs of distribution per unit of product are increasing more than proportionately to the increase in units distributed. This classification might seem less important than the others, since it might be presumed that no sales organization would distribute for any length of time under such inefficient conditions. This however, is not true, since many sales organizations of manufacturing establishments pass through this stage of distribution in emerging from constant-cost distribution, or before going into decreasing-cost distribution; and many of them often distribute for long periods of time under these conditions, for various reasons, such as delay in securing

capital to increase the distributive facilities, or because of sluggishness of demand which necessitates the continuing of the old distributing capacity.

Marginal and Supramarginal Manufacturers.—Many of these manufacturers, by reason of better sales organizations and more up-to-date methods, are distributing at a less cost than others. These men who are distributing at a less cost might be called supramarginal manufacturers, and the men who are working under increased inconveniences and with less progressive distributive appliances, and whose costs are therefore greater, may be called marginal manufacturers. If only 80 per cent of the total product demanded can be distributed by the supramarginal manufacturers, the remaining 20 per cent must then be distributed by the marginal manufacturers; in which case the latter are absolutely necessary to satisfy the demand for the product from this industry. Because of this fact, their cost of distribution will determine the selling price of the article, since the highest distribution costs must be met if this 20 per cent of the product is to be forthcoming. As the cost of distribution of the marginal manufacturers is greater than that of the supramarginal, and the selling price the same for both, it follows that the latter class of producers will be making a greater margin of profit than the former. As distribution at increasing costs has been assumed in this case, there would not be much incentive to increase distribution by means of advertising, but there might be a strong incentive to hold the present market or to cut down selling expenses by means of publicity.

Advertising Expense When Included in Selling Price.—Why are supramarginal manufacturers more efficient? Why are their costs of distribution per unit less? There may be a great many reasons for the existence of these conditions,

but perhaps one cause for their lower distribution costs is the fact that they are carrying on an extensive advertising campaign. And, conversely, it is probably true that the distribution costs of the marginal manufacturers are high because these producers have a poor sales organization and have not reduced their distribution expense by an aggressive advertising policy. It is clear, then, that the unit of distribution cost of the marginal manufacturer may not include any expense for advertising. Yet it is this distribution cost that fixes the selling price. Thus it is seen that the selling price may have no element of advertising expense in it, and in such cases advertising costs would not be paid by the consumer.

As has been said, all the supramarginal manufacturers, by advertising, may have decreased materially their costs of distribution or may have succeeded only in holding the market against others. If forced to, they could actually sell their product for less than they do, because their distribution costs per unit of product are much less than those of the marginal manufacturer; but since the demand cannot be met by these supramarginal manufacturers alone, these producers are reluctant to reduce their selling price to meet their lower distribution costs until competition forces such a reduction. If, however, the demand for this product should drop 20 per cent, the marginal manufacturers would be the first to leave the market, in which case the demand could be supplied entirely by the supramarginal manufacturers. Competition among these more efficient manufacturers might then enter in, and the selling price would probably be reduced to the new costs. Of course, in this case, the selling price would actually include the advertising appropriation.

Deferred Payment of Advertising Costs.—The increase in costs per unit as a consequence of greater distribution may not

be shifted immediately by the supramarginal manufacturers to the consumer, due to keen competition or lack of good-will, but may be considered as promotion costs and spread over a period of years or treated as an investment. There seems to be a growing tendency to treat as an investment advertising costs which increase good-will but which cannot be immediately recouped in the selling price.

Of course, advertising costs which merely maintain distribution should be considered an expense. The same is true of advertising costs which seek primarily to secure distribution. This applies to goods which are purchased only once or twice in a lifetime With these goods, if a competitor gets the one sale, the manufacturer cannot hope to sell that person again. If, however, merchandise is of such a character that it is quickly consumed, even though a competitor gets the first sale a second soon becomes possible, and the manufacturer's advertising which secures this may justly be called good-will advertising and treated as an investment.

Many manufacturers at different times in their history have treated advertising in this manner, and have later written off the good-will item when the anticipated future earnings materialized. In these cases, the consumer of these products did not pay for the advertising costs; these were finally absorbed by lower per unit distribution costs when the organization reached the stage of decreasing costs. Other concerns have left the good-will item in their balance sheets and have only taken out of operating expenses interest on this amount. Hence, consumers have paid for only a portion of the advertising costs in these cases.

3. Distribution Under Decreasing Costs

Definition of Decreasing-Cost Goods.—The third classification of distribution is that of decreasing costs. This classification is perhaps more important than all the rest, because

a very large percentage of manufactured goods are distributed under decreasing costs. In industries where this is true, the cost of distribution per unit of product decreases more than proportionately to the increase in units distributed. Examples of decreasing-cost industries are to be found in many large plants where all the distribution utilities of sales organizations are not fully utilized. For instance, in the large sales organizations of the packers, distribution can increase between wide limits and still show a continuously decreasing cost per unit of product.

Price Determinant.—In this classification of industries there are likewise marginal and supramarginal manufacturers; in other words, those who are working under the most adverse circumstances—under the highest distribution costs—and those who are working under more favorable conditions, with less distribution expense per unit of product. From the standpoint of price-fixation decreasing costs are the reverse of increasing costs, because under the former condition of distribution the price is fixed, not by the manufacturers who distribute to the greatest disadvantage, but by the largest and most progressive manufacturers. If there is any increased demand for the product, the supply to meet it would naturally come from the larger plants, where a more complete utilization of the fixed investment in distribution facilities would decrease the costs of distribution per unit of product and enable these manufacturers to lower their selling price. On the other hand, since the smaller establishments are often unable to lower their distribution costs in the same proportion they drop out of existence, and resign the market to the larger concerns which are able to hold it by still further increasing their distribution, lowering their distribution costs and their selling price, and stimulating and developing new increments of demand.

Where Consumer Bears Expense Levies.—Does the consumer of decreasing-cost goods pay for their advertising? Since this classification comprises many of the goods daily consumed, it may be well to spend a little more time analyzing the possibilities of the situation. To begin with, the principle may be laid down that any charge or expense levied against an article is only borne by the consumer when the effect of such levy is an increase of price. Thus a tax of $1 on each pair of shoes, having a distribution cost of $5, would make necessary a distribution price of $6. In this instance, the price of a pair of shoes rose from $5 to $6, hence the consumer pays the tax. Again, suppose a law made necessary the introduction of devices to protect employees from being injured by machinery. This new levy against the product would most likely result in an increase of price to the consumer, since it would not enlarge the distribution of the article. If the new levy of expense could have resulted in a wider distribution of the article, and if the overhead did not increase proportionately to the increase of distribution, then there would have been a *less* distribution charge against each unit of product; in other words, the distribution cost of each unit would have been reduced. Now, if competition were active, the selling price would be forced down to this new cost, and instead of being higher because of the new levy of expense against it, the price would actually be lower than it previously had been because the distribution cost was lower. Hence the consumer would not be bearing the new levy of expense.

Advertising Expense and Distribution—Ratio of Increase.—As regards advertising, can it be shown that it actually increases the distribution of some goods, and that in these cases overhead does not increase in the same proportion as the increase of distribution? If these two points can be shown conclusively, then it is true that the distribution cost per unit

is decreasing as the distribution increases, and with active competition, the selling price will tend to fall toward the cost price. The phrase, "tend to fall," is used because it might be some time before competition would become strong enough to affect the market. But when this competition becomes able to meet a large part of the demand, it could afford to lower its prices to meet its decreasing distribution costs; and the other manufacturers of goods would have to follow suit or be forced out of the market, all other conditions of quality, service, and the like, being equal.

Effect of Advertising on Costs.—That advertising increases distribution for decreasing-cost goods, resulting in lower per-unit production and distribution costs, is a fact that can be verified by many concrete instances.[2] The example of carborundum is a case in point. In 1893 a chemist in a little town in Pennsylvania accidentally created carborundum. He was experimenting with electric current, which he introduced into an iron bowl containing some clay and crushed coke. When the carbon was removed, he perceived that tiny, shiny, blue crystals stuck to it. He found that they were as hard as diamonds and could be used to polish gems. Before this time, diamond dust, selling at 70 cents a carat, was used for this purpose; but it was now displaced by carborundum which could be produced for 40 cents a carat, or $880 a pound. With a narrow market it would be difficult to reduce

[2] As regards costs, a commodity may be considered from the standpoint of production as well as of distribution. If the former standpoint is considered, a decreasing-cost commodity may be defined as one, the costs of production per unit of which, decrease more than proportionately to the increase in the number of units produced. An increase in volume, therefore, as regards some commodities, tends to reduce the per unit cost of manufacture as well as the per unit cost of distribution. An industry in which an increase in volume has both these effects may be termed a double decreasing-cost industry, and a commodity produced in such an industry may be termed a double decreasing-cost commodity. It is possible, of course, for a product to be manufactured under a different classification of costs than it is distributed under and vice versa. In such instances, any reduction in per unit cost of distribution due to volume may be offset by an increased cost per unit of manufacture, or vice versa.

the unit cost of production. A wide demand had to be secured, new uses had to be found, which could be accomplished only when the merits of the product were thoroughly known. With this purpose in mind, advertising was extensively used; and, as a result, demand rose at a rapid rate, necessitating new methods of production, since the productive capacity heretofore had been only 50 pounds a year. How advertising and intensive selling methods acquainted the people throughout the country with the merits of this article, is a story that reads like fiction. Suffice it to say that because of the demand for this product, which eventually became enormous and which permitted large-scale production, and because of internal economies, the production and distribution costs fell. The selling price per pound dropped successively from $880 to $440, then to $10, while in 1919 it sold for 12 cents. A drop from the price of diamond-dust to the price of common emery in a period of 24 years was the result, at least to some extent, of educating the public to the uses to which carborundum could be put.

Effect of Advertising on Prices.—According to our premise, the consumer only bears an expense levied against an article when the price of the article is raised directly because of that levy of expense. Now it has been shown that in some cases prices fall because of a levy of advertising expense, and under such situations it is difficult to see how the consumer is bearing the expense, as some have maintained. It might be said that the new price set by competition, after advertising has done its work, embraces the costs of production and distribution, and since advertising is one of these costs, consumers must pay this cost as well as all others. It does not mean, however, that consumers are being burdened, as the phrases, "bearing the cost of distribution," or "paying for advertising," imply.

In this connection, it might be asked whether the consumer of shoes and clothing, in the middle of the last century, "paid for" the expenses incident to the introduction of the sewing machine. He secured his shoes and clothing at a lower price and they were of better quality and workmanship. It might be more accurate to say that he profited by the change in methods of production rather than to say that he paid for them. The consumer paid nothing extra for shoes and clothing; in fact, he paid less for them. And so at the present time, if there is an introduction of a new and economical method by which distribution of goods can be increased materially without a proportional increase in expense, then mankind is benefited and pays lower, not higher, prices.
